Fred W. Maurer, one of the *Karluk*'s firemen, then came up, weak and emaciated. I did not recognize him until Munro spoke his name. He smiled in recognition, but was so visibly affected that I refrained from questioning him. Templeman, the steward, next appeared. He was gaunt and very pale. Templeman in his charcteristic way the summer before had declared that he would "be the last —— —— to starve on this —— —— expedition." And now he reminded me of his profane but lightly uttered promise. The caribou-skin clothing of these two men was in the same condition as that of Munro; they had been compelled to wear it daily and sleep in it for six months.

The belongings of the rescued men were collected in a very few minutes, while I sat in the tent and wrote a message for any vessel that might arrive later. The tent was left standing to serve as a beacon.

We hastened aboard the *King and Winge*, which was immediately headed for Cape Waring, thirty miles to the eastward. Our Japanese steward prepared a delicious breakfast for the castaways, who also consumed quarts of coffee that morning, heaping spoonfuls of both sugar and condensed milk into each cupful.

On the way to Cape Waring the survivors each indulged in a bath—a luxury they had not known in six months or more. After their bath their old clothing was thrown overboard. They were given new clothing from the ship's stores, and by almost every one on the ship, and I loaned them a fox-skin sleeping robe which Stefansson had presented to me.

Although Munro had lost about thirty pounds in weight in the past few months, he was found to be in remarkably good condition and insisted on piloting the *King and Winge* to the other camp. He was soon coaxed below to the breakfast table, however, where he told a few of the party's experiences.

When asked why they all wore beards, a clean-shaven face being the most effective way of escaping frost-bite, Munro replied, "not a single razor was brought ashore, but I managed to keep my beard trimmed by pushing it up to within reach of my teeth and biting off the ends."

We reached Cape Waring, where the other survivors were living, almost before we were aware of it. With the aid of glasses we could see two tents on shore, and little black figures running up and down the beach, trying to attract our attention.

Snow now began to fall so thickly that the schooner could not be seen a quarter of a mile away. Several of the marooned men rushed out upon the ice to meet us. They had hunted every day, we were told, but had not been able always to kill enough game, so that at times the little band had gone hungry. They were in a desperate plight when we arrived, and had that day attempted to move their camp to the north side of the island where driftwood was known to be comparatively plentiful. They would have done this but for the snowstorm, in which case we would have been compelled to search the island for them. They had abandoned hope of rescue for that year and had but forty cartridges left. Forty cartridges with which to provide meat for nine hungry mouths for a whole year! For Wrangel Island can be approached by ships only during a few weeks each summer. Their flimsy tents were torn and full of holes and their food supply was almost exhausted.

The nerve-racking suspense suffered by the castaways while waiting for relief must have been terrible. They had no way whatever of knowing whether Captain Bartlett had been able to reach the mainland, and very few ships ever pass near enough to distinguish even a smoke signal on the island. Their rations, even with the strictest economy, lasted only until the first weeks in June, and for the three months previous to our arrival, they had subsisted on whatever game they could obtain. Wood was plentiful and fresh water could be had by melting snow or pieces of year-old salt-water ice that had been exposed to the rays of the sun, and thus made into fresh ice. Tobacco, tea, coffee, salt, sugar, flour and other luxuries they had not known for several months, but still they were alive and well and happy.

By stretching sealskins over a frame of driftwood, they had made an Eskimo *kayak*, probably the "crankiest" type of boat in existence, and in this Kurarluk, the Eskimo hunter, had been able to hunt seals with fair success. Only three dogs of their original twenty were left, and but one sled of their original three. The rest had been lost with their loads in the water between Wrangel Island and Herald Island, They had a plentiful supply of matches. but their clothing was woefully inadequate. One man had frozen the great toe of one foot in March, and it had been amputated with a butcher knife and the tin shears. Another had fallen into the water in March and had frosted the heel of one foot; he was still limping. They made a weird-looking procession as they walked out to the *King and Winge* by twos, with the Eskimo baby on her father's sled. After they climbed aboard the little rescue ship, we sailed for Nome—and civilization—by way of Herald Island, where we hoped we might find a trace of some of the missing men. But a solid field of heavy ice barred our progress, and though we skirted its edge for forty miles, no sign of the missing adventurers was to be found.

## The Radical Trail in Welfare Laws

—— (*Concluded from page 7*) ——

Third, the separate bureau or board;

Fourth, centralization through Federal bureaucratic control.

If such a program were to end with exorbitant taxes, coercion and the breaking down of constitutional governmental it would be bad enough but it goes far deeper—it imposes a condition in which no man is master of his home because of the constant supervision of Government agents, it creates a nation of beggars, slackers and irresponsibles who are taught to look to Government for their every need. Teaching people to be dependent on the Government is one of the most insidious methods of destroying national morale.

The ultimate object of centralized Federal control is socialistic;

The objective of socialism is communism;

The objective of communism is nationalization;

And the goal of nationalization is Sovietism.

Federal extension of power over our public utilities, our women, our children and our private property rights through the misleading "separate agency" plan leads to the establishment of bureaucratic boards, commissions, and other agencies that interpret their own laws, promulgate their own rules—often inconsistent with law—and administer their own finances, present the ever-increasing problem of the invasion of constitutional rights and the encroachment upon the prerogatives of private property and citizenship.

And when defeated in one corner these same people run to another corner and try to force the rejected thing on the United States, under guise of a local District of Columbia Act, it is time to call attention to it.

# Who Is Babbitt? "It's Me" Says Sinclair Lewis

(Concluded from page 2)

vests of the Noonday Lunch Club habitués. I knew that he had told us that the reading of the average Babbitt consisted of "the newspaper comic strips"; that the average music of us Babbitts consisted of the "Jungle Jazz." I remembered——

Then Mr. Lewis said to me: "I have still an additional shock for the intellectual highbrows."

"What is it, Buddie?" I asked him.

"I'm an honorary member of the Kiwanis Club of St. Cloud, Minnesota."

"Has this startling information ever before by any chance leaked out? I am writing this article for a magazine that has for its motto, 'The Chronicler of Neglected Truth!' I want special authority to tell the world that you are a member of a Noonday Lunch Club!"

"You have it," said Mr. Lewis with a grin. "You know," he said, "I did not write *Babbitt* in scorn of the average business man; I wanted to satirize inanities of which many others besides Babbitt are guilty. I wanted to hit the back-slapping, loud-yelling salesman type and make him see himself as he appears to others.

"All of my books—all of any man's books which have any realism—are largely biographical.

"One of the pleasures of living is ability to converse intelligently. The art of conversation has died out in America. Coming down here on the train between Chicago and Kansas City, I listened to two fairly intelligent, well-dressed business men talking. Their conversation went about like this for the greater part of the trip:

" 'How is your business, Jim?'

" 'Oh, fine. I put on an extra salesman this year.'

" 'Great! You put on an extra salesman this year. That makes eleven?'

" 'Yes, I had only ten last year, but business is better and I put an extra salesman on.'

" 'Yes, business must be better if you put on an extra salesman.'

" 'Yes, I put that extra salesman on this year. Business is better.'

" 'I should think so if you had the nerve to put on an extra salesman.'

"So it continued all afternoon. We passed a beautiful sunset but I doubt if they even saw it. In the midst of this glorious sunset the train stopped at a little town where there was an unusually large sandpit. Both of my fellow-travelers commented casually on the depth of this hole. It suggested commerce to them. The sunset suggested nothing. The sandpit absorbed them for a few minutes because of its size. Then they went ingloriously back to their comments on the daring business adventure of putting on an extra salesman. Said the more aggressive of the two: 'Yes, we put on an extra salesman this year. We thought that business was good enough to take a chance.'

"Then came the everlasting comeback of his friend, 'Yes, business must be good if you put an extra salesman on this year. That makes eleven salesmen you have, doesn't it?'

"It *was* monotonous. That conversation is an illustration of how dead and dull conversation has become in America. In the old days conversation was more vital. One hundred years ago when one of our pioneers had just been waylaid by a band of Indians and had fought his way home, or if he had killed a bear or had been compelled to swim a river, he had something to talk about. Lincoln liked to talk. He liked to sit around a red-hot stove and talk with his neighbors. Intelligent conversation with Lincoln was an art. The pioneers had heroic deeds to talk about. Today we converse mostly about motor cars."

"When they read *Main Street* in your home town did they become peeved?" I asked him.

"By no means," smiled Mr. Lewis, "They said, 'The boy has put the town on the map!' and they immediately called a restaurant by the name of the book. It bears the title 'The Main Street Café,' and across the street is the 'Gopher Prairie Inn.' "

"I have heard it said that they would lynch you if you went back to 'Main Street'?"

"Not so you could notice it. They have a sign up now which reads:

'THIS IS THE ORIGINAL MAIN STREET!'

"If the tourists who stop to get lunch or gas fail to make some comment on the fact that they are traveling over that immortal thoroughfare, the villagers will tell them about it and call their attention to the fact that they are standing on holy soil, namely, none other than 'Main Street,' Sauk Center, Minnesota."

During his stay in Kansas City, Mr. Lewis attended a meeting to which he was invited as my guest by Bishop Waldorf. It was not the kind of meeting to which he would particularly care to go. However, after some solicitation he went. They called on him unexpectedly to make a speech. He did. He stood between two bishops and said, "Damn." He hardly realized that he had said it. It caused a young cyclone of comment.

I, who had been urged to bring him, was accused of forcing him in. It was fun while it lasted. At a meeting of Methodist preachers the next Monday he was asked why he had said "Damn" in front of two perfectly respectable bishops.

His reply is another link in that inevitable chain which he and I are forging to tie him to Babbitt forever.

He said: "I did say 'Damn' but it was not a vulgarity on my part. Criticism of that word was a lack of knowledge of etymology on the part of those who criticized. 'Damn' is a shortened form of the word 'condemn.' However, I don't deny that ordinarily I am profane. I'm one of the common people I write about."

"Do you consider *Main Street* a fair representation of American life?" one minister asked him.

"I do not. I never said it was. No novelist can represent a type or a class. He cannot do everything in one book or in a lifetime. If I try to balance a good character against a bad character; if I try to be perfectly fair to good and bad alike, I do not write my book with passion."

"Do you think that moral purpose is necessary in fiction?" another preacher asked him.

"I do not. Any moral purpose in my books has been added incidentally or accidentally. I try to paint people as authentic human beings in their relations with each other. I try to portray them with honesty and with vividness."

*Arrowsmith* is the story of doctors and scientists. Mr. Lewis' father is a country doctor. He has a hundred friends who are in the medical profession. They all admit that, technically, he knows what he is talking about.

The original of old man Gottlieb? Well, he would rather not say. The original of Martin Arrowsmith? Well, once again: "It is largely autobiographical." He does not try to dodge the bad in his leading characters. They are good and they are bad. So is he. He admits it. He therefore admits that he is human. I have never known a man more intellectually honest.

There was an original for Leora of *Arrowsmith*. There is also a beautiful background for the more than wholesome and faithful love story that runs between Leora and Martin Arrowsmith; one of the most natural, the most lasting and loyal love affairs between an everyday man and wife that recent fiction has given us.

When *Babbitt* first came out I protested to Sinclair Lewis that in "Doc Drew" he had not painted all of the modern preacher. He had just pictured the efficient fellow, the advertiser, the alert, the active preacher; but not the pastor, the friend. With a smile he reached for a copy of *Babbitt*, and put this autograph on a flyleaf for my library:

"To William Stidger (who is NOT Doc Drew)

From Sinclair Lewis (who is Babbitt)."

## For Coffee Lovers

### Who fear caffeine

There is a coffee with the caffeine taken out. A coffee all may drink at any hour and to their hearts' content.

Not mock coffee, but real coffee—a rare and delightful blend. We simply open the pores and remove the caffeine. That is the source of all coffee's harm.

Caffeine is tasteless and odorless. Its removal does not affect the flavor or aroma in the least.

This coffee is called Kaffee Hag. The finest hotels now serve it. In countless homes it is the favorite brand.

Learn what it means to you and yours. A coffee you need never fear or stint. A coffee you can drink at night and sleep. Children can enjoy it.

This coupon with a dime will bring a 10-cup package to you. Get it for some coffee lover who cannot drink caffeine. Clip coupon now.

MAIL THIS TODAY TO:

# The World With the Church

(*Concluded from page 5*)

Yet, while the churches could teach temperance, they could not bring it about. The uncanny affinity of ethyl alcohol and the human senses continually showed itself, and scientific investigation tended more and more to regard alcohol as distinctly poisonous. Therefore, it very early became a conviction among many lovers of humanity that the only safe method to protect society from excesses due to alcohol was to protect society from alcohol in every intoxicating form.

***When Christianity Conquers Warring Nations***

This is a conviction which thousands of men who profess no religion share with religious men. It is a conviction which thousands of men, whose churches are not exponents of prohibition, share with members of prohibition denominations. But, after all, prohibition is a secular measure. It is like a law against bank robberies or a law against food adulteration. The churches, to whose keeping the nurture of men's souls is intrusted, have still the duty of teaching self-control, observance for law, in the matter of prohibition as in the matters of theft or assault and battery.

Yet when this great secular measure was finally adopted as a part of the Constitution of the United States, many seemed to think a great victory had been won for religion!

If prohibition is the chief question which the man of the world raises in discussing the church, international peace is probably the chief question which churchmen of today raise in discussing the world. Yet here, where some hopeful souls imagine the church is doing something, the present-day church can do nothing for the present crisis. The hope of peace in the world, through the church, depends not at all upon what any present organization of churches may be doing in the discussion of peace. *It depends entirely on the amount of work done by earlier generations of churchmen, rearing present-day statesmen in Christian principles.*

The only peace that came to the world was a peace which came as a Christian benediction. It was on account of the Christian principles of the victors that conquered Germany, Bulgaria, Austria, and Turkey were not overrun, blighted, and the people enslaved. The peace-treaty table at Versailles saw gathered about it men who professed to have advanced beyond Christianity in thought, but whatever was truly Christian in that treaty will endure, and what was not the ages must revise.

***Hope of the World Lies in Training Young***

*No religious organization for peace has accomplished any of the peace moves which have been made thus far.* The League of Nations has prevented some developments which might have led to war. The Treaty of Locarno promises much more calm to the world than any previous treaty foreshadowed. All that the present church organizations for peace have done is to discuss these *accomplishments of statesmen,* and also to discuss such schemes as "the outlawry of war," which they are at liberty to discuss, as they might discuss the relative value of chess and checkers. Neither chess, checkers, nor the outlawry of war have anything to do with the mission of the church to rear men in the nurture of the virtues which will bring peace by righteousness.

The world has made some advance toward peace since the World War ended. In this advance there is a selfish economical element and an altruistic religious element. But the altruistic religious element in the peace movement, whether it shows itself at Locarno or in the coming disarmament conference, is not to be ascribed to any present church organization for the outlawry of war, or any other ecclesiastical body meddling in temporal power. *The hope of the world is that there are men at these conferences who, in their boyhood, were nurtured under the pastoral care of obscure, long-sainted Christian teachers, who taught them peace as they taught them honesty, and told them the wickedness of conquest as they told them the wickedness of lying.* And the only hope of the future for peace is not in large organizations of church leaders making second-hand comments on the secular writings of laymen. It is in the degree in which the children in our Sunday schools are trained, by college graduates or others, in the authoritative principles of Christian conduct.

ADVENTURE LAND ON THE GREAT NORTHERN

Glacier
NATIONAL PARK

*Open June 15th to September 15th*

YOU will enjoy living at least a little while this summer amid the unspoiled million acres of Glacier National Park. Its glistening summits, its sparkling mile-high lakes, its great stands of first growth fir and pine, its flashing waterfalls, its tremendous vistas, at once possess you with their spell.

You do what you please when you please—fish, hike, ride horseback, climb; tour in motor coaches and motor launches; or just loaf luxuriously. You ride practically into the Park in the comfortable luxury of the de luxe New Oriental Limited or other fine Great Northern trains. The Great Northern's roadbed, running across the Continental Divide through low altitude Marias Pass, forms the 60-mile southern boundary of Glacier National Park.

Plan your trip now. Mail the coupon. Burlington Escorted Tours include Glacier National Park; or you can take one of the Great Northern's own fixed cost tours of one to seven days or longer. Inquire now.

# War Makes Stunted Children

## The "Gaunt Dogs" Ravage a People and Devour the Food of Its Offspring

By ALBERT ERNEST JENKS
Professor of Anthropology, University of Minnesota

WHAT is the effect of war, not upon the death-rate of the children of a nation, but upon the physical development of those who survive? How long after warring armies have left the battlefields and put away their arms in peace, do the gaunt dogs of war ravage a people and devour the food of its children?

Anthropology has definite data at hand which partially answer these questions for a part of the people in the World War. It is not unlikely that similar facts exist among most of the nations of Europe which were actually engaged on the battlefields of that war.

In the spring of 1925 I was resident in Munich, Southern Germany, at the Anthropological Institute of the late Doctor Rudolf Martin. In connection with that institute I witnessed the 1925 annual measurements of Munich school children. So startling was underdevelopment among those children that I have had sent to me some of the material for its scientific value.

Most fortunately there is now available for comparison with the children of Munich, Dr. Bird T. Baldwin's standards for American-born school children, both boys and girls, of the same ages, published in the *Journal of Physical Anthropology*, January-March, 1925. Dr. Baldwin's data cover the records of "74,000 boys and 55,000 girls who had at least five repeated annual measurements; all were presumably healthy American-born children from twelve schools in the eastern and middle portion of the United States." Dr. Martin's measurements are of the school children of Munich as made annually in the schools. Those presented here are, as are those of Dr. Baldwin, the entire run of those in attendance at school on the day measured. It is evident that both groups of children are at the date measured the general run of the best of their age in each nation, because children physically, mentally, or morally unfit are less in attendance at public schools than are the fitter ones. I know of no facts to militate against the fairness and scientific value of using the two sets of measurements in the comparative study headed "Table I."

At once in the table is noted the great similarity between the American-born boys of the ages of 7, 8, and 9 years and those of the same ages respectively in Munich as measured in the spring of 1914—just before the beginning of the World War. An equally striking similarity is seen between the American-born girls of the ages of 8 and 11 years and those of the same ages respectively in Munich in 1914.

The practical uniformity in correlation of height and weight with age for boys of the age of 7, 8, and 9 years and for girls of the age of 8 and 11 years can mean only that the racial elements of America and of Germany are very similar, being largely Teutonic, and Alpine or Celtic, and also that under normal peace-time conditions the children of both nations enjoyed very equal conditions of health, nourishment and growth. So far as the boys are concerned those of peace-time Munich were slightly taller at 7, 8, and 9 years than were the American-born boys of the same ages. But thereafter, or in the age-groups of 10, 11, 12, and 13 years, the two nationalistic groups change relationship, and the American-born boys are consistently taller and heavier than the boys of the same age-groups in Munich of 1914. It would appear that the taller stature of American men, as compared with that of German men, begins its acceleration in the pre-adolescent period, and that the German males never catch up the lead gained by the American-born boys 10, 11, 12, and 13 years old.

The main purpose in publishing this article is to illustrate that such calamities as the World War stunt the childhood development of the nations actively engaged in the war, for at least six and one-half years. Although complete statistics are not yet available for the measurements of 1925, still from personal knowledge I know, and some photographs are here presented as evidence, that ten and one-half years after the beginning of the war the stunting and underdevelopment of the children is still most evident. Either the food supply is still short, or sufficient time has not elapsed for the children to make up their earlier loss of development.

As might be expected, the underdevelopment was more marked in the boys of 13 years than in those of 7 years. The war had definitely stunted 70 out of every 100 of the 13-year-old boys 5.7 centimeters or 2¼ inches, and 76 out of every 100 boys 4.7 kilograms or 10 pounds in weight. While 16 out of every 100 were more than 12.5 centimeters—practically 5 inches—shorter than the pre-war average, and 12 out of every 100 were 8.7 kilograms or 19 pounds lighter.

By consulting Table I, the stunted condition of the Munich school children six and one-half years after the beginning of the war is readily seen by comparing the height and weight of those of 1921 with those of 1914. In each of those age-groups the children, both boys and girls, of the year 1921 are shorter and lighter than those of 1914. And, as of course would be expected, the Munich children of 1921 are consistently shorter and lighter than the American-born children of the same ages.

The accompanying photographs help to visualize the meaning of childhood underdevelopment due to the effects of war.

The boy marked "A" in the 7-year age-group corresponds to the average type in the pre-war normal 7-year age-group of 1914. The boy marked "C" corresponds to the distinctly underdeveloped boy of 1921. The boy marked "B" corresponds to the average type of 1921. Of the total number of 7-year-old boys in 1921, 72.7 per cent were the same height as "B" and 81.9 per cent were of the same weight. While 11.6 per cent were taller than "A" and 12.6 per cent heavier; and 15.7 per cent were shorter than "C" and

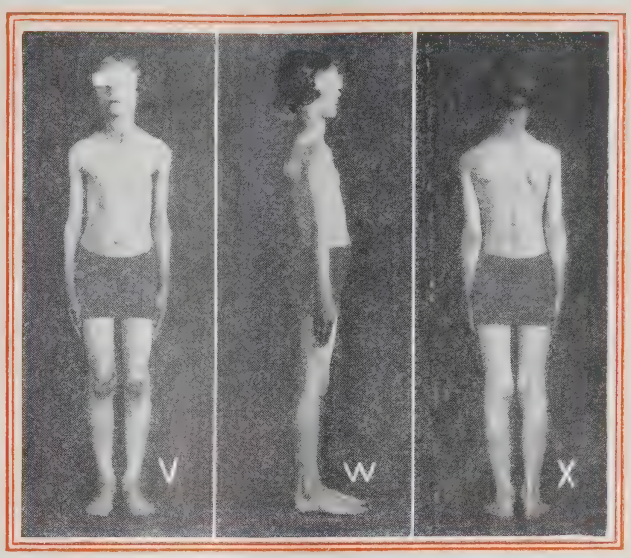

**TABLE I: Weight—Height—Age Standards of School Children.**

***A Study of the Effect of War.***

| Characterization of groups studied | Age in years at nearest birthday | Height in centimeters | Weight in kilograms |
|---|---|---|---|
| American boys, age-group mean | 7 | 119.5 | 22.75 |
| Munich boys, average in 1914 | 7 | 120.4 | 22.1 |
| Munich boys, average in 1921 | 7 | 117.2 | 20.8 |

| Munich boys, average in 1921 | 10 | 131.3 | 26.9 |
| Munich boys, underfed in 1921 | 10 | 125.3 | 23.6 |
| American boys, age-group mean | 11 | 142.5 | 35.1 |
| Munich boys, average in 1914 | 11 | 137.8 | 30.5 |
| Munich boys, average in 1921 | 11 | 134.5 | 28.7 |
| Munich boys, underfed in 1921 | 11 | 128.2 | 25.0 |
| American boys, age-group mean | 12 | 146.0 | 37.5 |
| Munich boys, average in 1914 | 12 | 143.0 | 34.3 |
| Munich boys, average in 1921 | 12 | 138.8 | 30.9 |
| Munich boys, underfed in 1921 | 12 | 131.8 | 26.6 |
| American boys, age-group mean | 13 | 152.5 | 41.2 |
| Munich boys, average in 1914 | 13 | 148.2 | 38.1 |
| Munich boys, average in 1921 | 13 | 142.5 | 33.4 |
| Munich boys, underfed in 1921 | 13 | 135.7 | 29.4 |
| American girls, age-group mean | 8 | 124.5 | 24.8 |
| Munich girls, average in 1914 | 8 | 124.3 | 24.1 |
| Munich girls, average in 1921 | 8 | 121.4 | 22.5 |
| Munich girls, underfed in 1921 | 8 | 115.0 | 19.4 |
| American girls, age-group mean | 11 | 139.5 | 33.1 |
| Munich girls, average in 1914 | 11 | 139.1 | 31.9 |
| Munich girls, average in 1921 | 11 | 135.0 | 28.7 |
| Munich girls, underfed in 1921 | 11 | 128.4 | 24.7 |

"G H I"—Munich school children in 1921; girls eight years old.

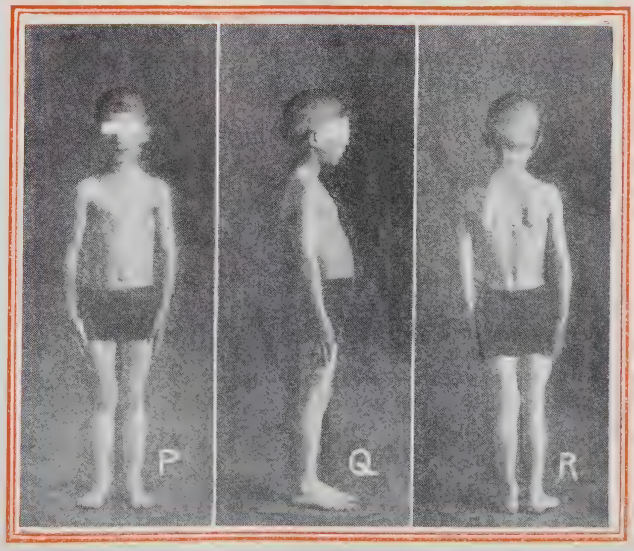
"V W X"—Munich schoolgirls in 1925; eight years old.

5.5 per cent lighter. It is thus evident that in the examples given of the 7-year age-group there were more boys in 1921 shorter and lighter than the underfed boys than there were those taller and heavier than the average in 1914. And this condition is also true, as could be learned from Table I, of all the age-groups of the 1921 boys.

About the same story is told in the statistics of the girls. Of the 8-year-old girls in 1921 the girl marked "G" corresponds to the average type of the normal 8-year-old girls before the war in 1914. The girl marked "H" corresponds to the average 8-year-old type of 1921, and the one marked "I" corresponds to the distinctly underfed 8-year-old girl of 1921. Seventy-five and eight-tenths (75.8) per cent of the 8-year-old girls in 1921 were the same height as "H," and 80.2 per cent were of the same weight. Thirteen and three-tenths (13.3) per cent were taller than "G," and 10.9 per cent were heavier, but 15.4 per cent were shorter than the distinctly underfed girl "I," and 8.9 per cent were lighter.

The height and weight measurements in Table I show that the average height of all the age-groups given, both boys and girls, of Munich for the year 1921 was 3.7 centimeters or nearly 1½ inches less than in 1914; and that the average weight was 2.5 kilograms or a little more than 5½ pounds less than in 1914. In other words, the stunting process during the six and one-half years following the opening of the World War has cost the school child in Munich between the ages of 7 and 13 years the average of 1½ inches in stature and 5½ pounds in weight.

Again, analysis of the table shows that the 1921 Munich boys of 7 years, both the average "B" and the underfed "C," are so stunted that neither one corresponds to any of the 7-year or even to any 6-year American-born boys—when one attempts to coördinate weight with height. The underfed 8-year type of Munich boy of 1921 is not found in the American-born groups of 8-years, 7-years, or even 6-years—when weight is coördinated with height. The same story is also true of the 9-year and the 10-year type of underfed boys in Munich in 1921; for their height, both are lighter than the 6-year-old American-born boy. The 11-year-old underfed Munich boy of 1921, however, is found in the group of American-born boys of six years, but even there he is one centimeter shorter than that American-born boy who is five years younger than he. The 12-year-old underfed Munich boy is not found in any American-born age-group of the same height. He is found only in groups of boys who are three centimeters shorter than he.



The Munich girls of 8 and 11 years reveal the same evidence of stunting. There are no 8-year, 7-year, or 6-year old American-born girls of the weight of the 8-year-old type. Even the 11-year-old Munich girl for her height is underweight for all American-born girls until the 6-year-old group is taken—and then girls 1.4 centimeters shorter than she must be used in coördination.

All the statistics and photographs of Munich children so far considered, subsequent to those of the normal year of 1914, relate to those who have had six and one-half years since the opening of the World War.

Some photographs and measurements of school children, studied in 1925 while I was at Dr. Martin's Institute, are presented without statement as to their anthropometric status among the other children of 1925, because such facts are not yet available. Those presented are typical; I saw many like them, and many worse. They illustrate that after ten and one-half years from the beginning of the war, Munich

"A B C"—Munich school children; boys seven years old.

"P Q R"—Munich schoolboy in 1925; seven years, six months old.

school children are still greatly handicapped in the matter of vitality.

The boy shown in "P Q R" was 7 years and 6 months old May, 1925. He was 115.2 centimeters tall, and weighed only 18.8 kilograms—the weight of the American-born boy 4.2 shorter.

The girl "V W X" was 8 years old May, 1925. She was 127.3 centimeters tall, but her weight was only 20.7 kilograms. That weight is found in American-born girls of 8 years who are 11.3 centimeters, or 4.5 inches, shorter than the Munich girl.

Scientific facts such as these, showing indisputable evidence of the disastrous effects of war on living children of nations, should have emphatic place in all arguments to outlaw war.

# On Weighing the Earth

By S. R. WINTERS

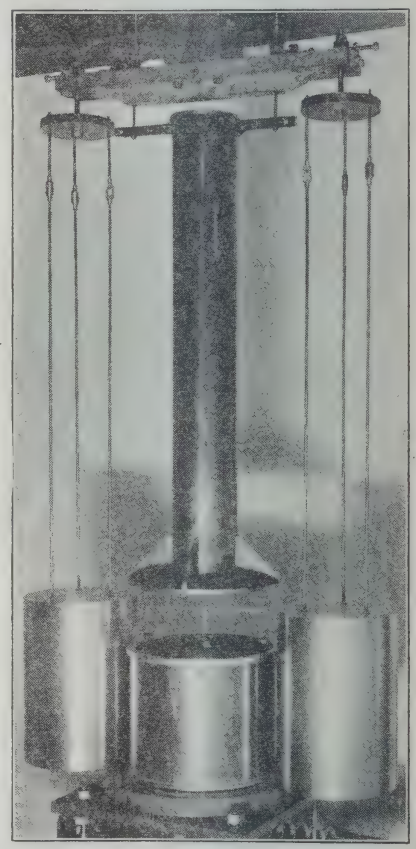
THIRTY-FIVE feet underground, in the sub-basement of the Electrical Building of the Bureau of Standards in Washington, may usually be found Dr. Paul R. Heyl. He is not a recluse—far from it. His retreats to the depths of his cave are in pursuance of his efforts to recheck the weight of the world.

Scientists believe that there is an error in present calculations of one-fiftieth of one per cent of six sextillion tons (the numeral six and twenty-one ciphers), a matter of some few quintillion tons.

Deep in the cavern where the frost of winter and the heat of summer do not penetrate, are sensitive instruments, especially designed for weighing this globe, as well as the sun, moon and stars. It was thirty years ago that this planet was last, figuratively, put into the balances and tipped the beam within the accuracy of one part in one thousand. The present rechecking may serve to increase this accuracy to one part in ten thousand or better.

"I want to find out how much heavier the earth is than that cylinder," Doctor Heyl said, pointing to an instrument of rather insignificant appearance, compared to the immensity of the project. The apparatus contains two gold balls, whose weights are accurate to one part in 100,000, suspended from the end of an aluminum bar. The latter, in turn, is hung by means of a light wire. This permits the apparatus to rotate. Two steel cylinders are placed near these gold balls and their attraction for moving bodies is measured by the amount the gold balls deviate from the true course of their swing. The entire mechanism is operated in a vacuum and the observer measures its behavior at a distance through a series of mirrors. The weight of the operator as well as his body warmth would affect the true operation of the apparatus, if it were not remotely controlled.

The gold balls of this earth-weighing apparatus are started swinging by holding a bottle of mercury near them. These balls, contrary to a report that has currency in some quarters, do not swing in an orbit. They swing back and forth as a tortion pendulum, the period of the swing being about 30 minutes. The requirements for building this apparatus were so exacting that eleven months were required for the work. Doctor Heyl hopes to complete his observations during the next year.



Then will begin the real problem—making the mathematical calculations. The assumed error with respect to the present estimated weight of the earth is only one-fiftieth of 1 per cent of the six sextillion tons which the earth is said to weigh. The experiments anticipate a reduction of this error to one five-hundredths of 1 per cent or about 120 quadrillion tons at the most.

"Of what value is it to the average person to know precisely the weight of the earth?" I inquired of Doctor Heyl.

"For practical purposes," he replied, "it means a closer knowledge of gravitation. It is a function of the Bureau of Standards to determine the constants with the greatest degree of accuracy. Incidentally, the results of these experiments should give us an indication of the earth's density.

When Doctor Heyl has completed his present task, he will have another scientific achievement to add to an already formidable list. In 1907, he was awarded the Boydon premium of $1,000 by the Franklin Institute of Philadelphia for having experimentally solved the problem of the speed of visible and invisible light rays. Notable among his recent scientific investigations was the attempt to explode the theory of relativity as advanced by Albert Einstein.

"I undertook to prove the theory of

Apparatus used by Dr. Heyl to weigh the earth.

Einstein wrong," declared Doctor Heyl. "I failed to prove him wrong but that does not mean that I proved him right."

Heyl was the inventor with Dr. L. J. Briggs, also of the Bureau of Standards, of an earth inductor compass, for which they were awarded the Magellan gold medal. Not unlike the purpose of the magnetic compass used on board ships, this instrument is designed to guide safely navigators of vessels and aircraft. This new type of compass utilizes the magnetic field of the earth, and it employs a revolving coil of wire instead of the conventional magnetic needle. It takes advantage of the fact that electric voltage of a direct-current dynamo is varied by changing the angle between the magnetic field and the brushes of the dynamo.

# A Dance a Week

## An Old American Square Dance—
## The Plain Quadrille—for Four Couples

This week we give the music and description of a quadrille. During the last two weeks we have described the several figures of a quadrille, which are now combined into complete dances.

### PLAIN QUADRILLE No. 1

### FIGURE 1

Metronome 116 Wait Eight Measures

During the first eight measures of the music, all address partners, then corners.

First four right and left..... 8 bars

Couples join nearest hands and cross over, ladies passing to the center. Gentleman, in passing, touches lady's right hand lightly. Arriving at the opposite side, he then takes partner's left hand in his left, and turns her half around. Each couple now stands in the other couple's original place. Repeat back to place.

Balance four..... 8 bars

Gentleman cross hands with partner, his right hand above, promenade seven steps to opposite side, each passing to the right. Turn, and return to place still keeping the lady on the outside.

Ladies chain..... 8 bars

"Ladies Chain"—Ladies cross to opposite places giving the right hands as they pass each other, and the left hands to the opposite gentlemen—turning once around—give right hand back—left hand to partner and turn to place.

Half promenade..... 4 bars

Half right and left to place..... 4 bars

All join hands, forward and back..... 4 bars

All join hands, start with left foot forward, advance three steps. On the fourth count bring right foot, raised, to the heal of the left. Starting with the right foot, walk back three steps, and on the fourth count bring left foot up in front.

Turn partners..... 4 bars

All join hands with partners, arms extended, waist high, and walk around, one complete turn.

Couples on the side, repeat all movements.

### FIGURE 2

Wait First Eight Measures

First two forward, swing in center..... 8 bars

Four ladies grand chain..... 8 bars

Four ladies cross right hands, walk half around, drop right hands, give left hand to opposite gentleman, turn one-half around. Each lady then returns to her own place by giving her right hand to the opposite lady, then left hand to partner and turn in place.

The next two forward, swing in center..... 8 bars

The head gentleman and opposite lady turn in center.

Four gentlemen grand chain..... 8 bars

Same as for ladies, the gentlemen giving right hands across.

The next two forward, swing in center..... 8 bars

The next two on the side, farthest from the head couple.

Ladies grand chain..... 8 bars

The last two forward, turn in center..... 8 bars

Allemande left..... 8 bars

All promenade..... 8 bars

All cross hands with own partner, and promenade around the outside of the set.

### FIGURE 3

Wait First Eight Measures

First four lead to right, chasse out, and form line..... 8 bars

Right and left..... 8 bars

Couples directly opposite execute the movement.

Ladies chain..... 8 bars

The same two couples.

All join hands forward and back, turn partners to place..... 8 bars

Couples in each line join hands, move four steps forward, and four steps back, then turn own partner to original place.

The side couples repeat all movements.

### FIGURE 4

Wait First Eight Measures

Eight hands around..... 8 bars

All join hands, and circle to the left. One complete turn.

Four ladies cross right hands, balance in line..... 8 bars

All promenade..... 8 bars

Cross hands with partner, and promenade in a circle.

Allemande left..... 8 bars

Each dancer turns back to back with own partner, walks four steps to the corner; meets new partner; they turn each other with right hand. Return four steps to place, and turn own partner with the left hand.

Grand right and left..... 16 bars

Face partners, salute, then join right hands, gentlemen moving to the right, ladies to the left, passing in opposite directions. Gentleman then drops partner's right hand, and takes next lady's left in his left; next lady's right in his right, and so on, alternating left and right hand in order. When half around, he meets and salutes his partner, gives her his right hand and continues to place. Note: this is a weaving in and out movement, passing to the right of one, to the left of the next, until the complete circle is made.

All balance corners, turn partners..... 8 bars

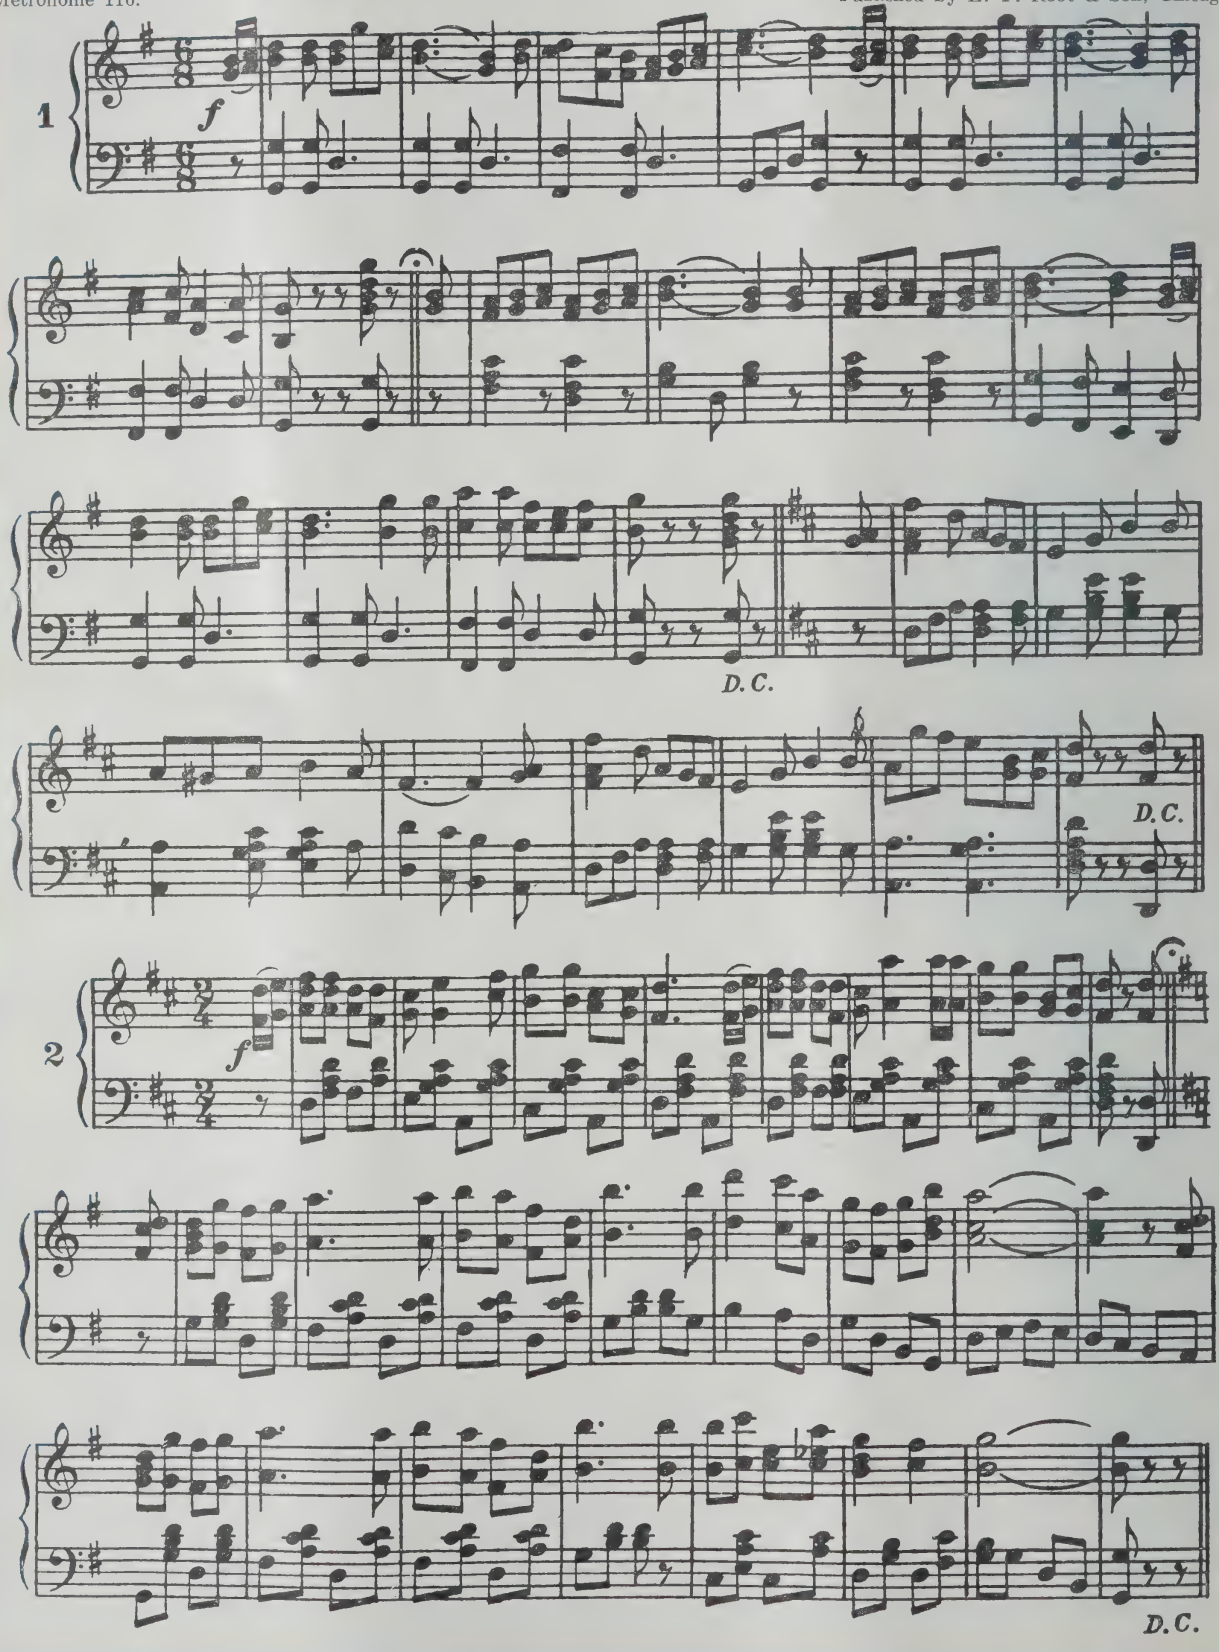
Face corner lady, step to side with right foot, point toe of left foot in front, step to side with left foot, point toe of right foot in front. Turn and face own partner, join hands, waist high, and turn once around.

All promenade to seats..... 8 bars

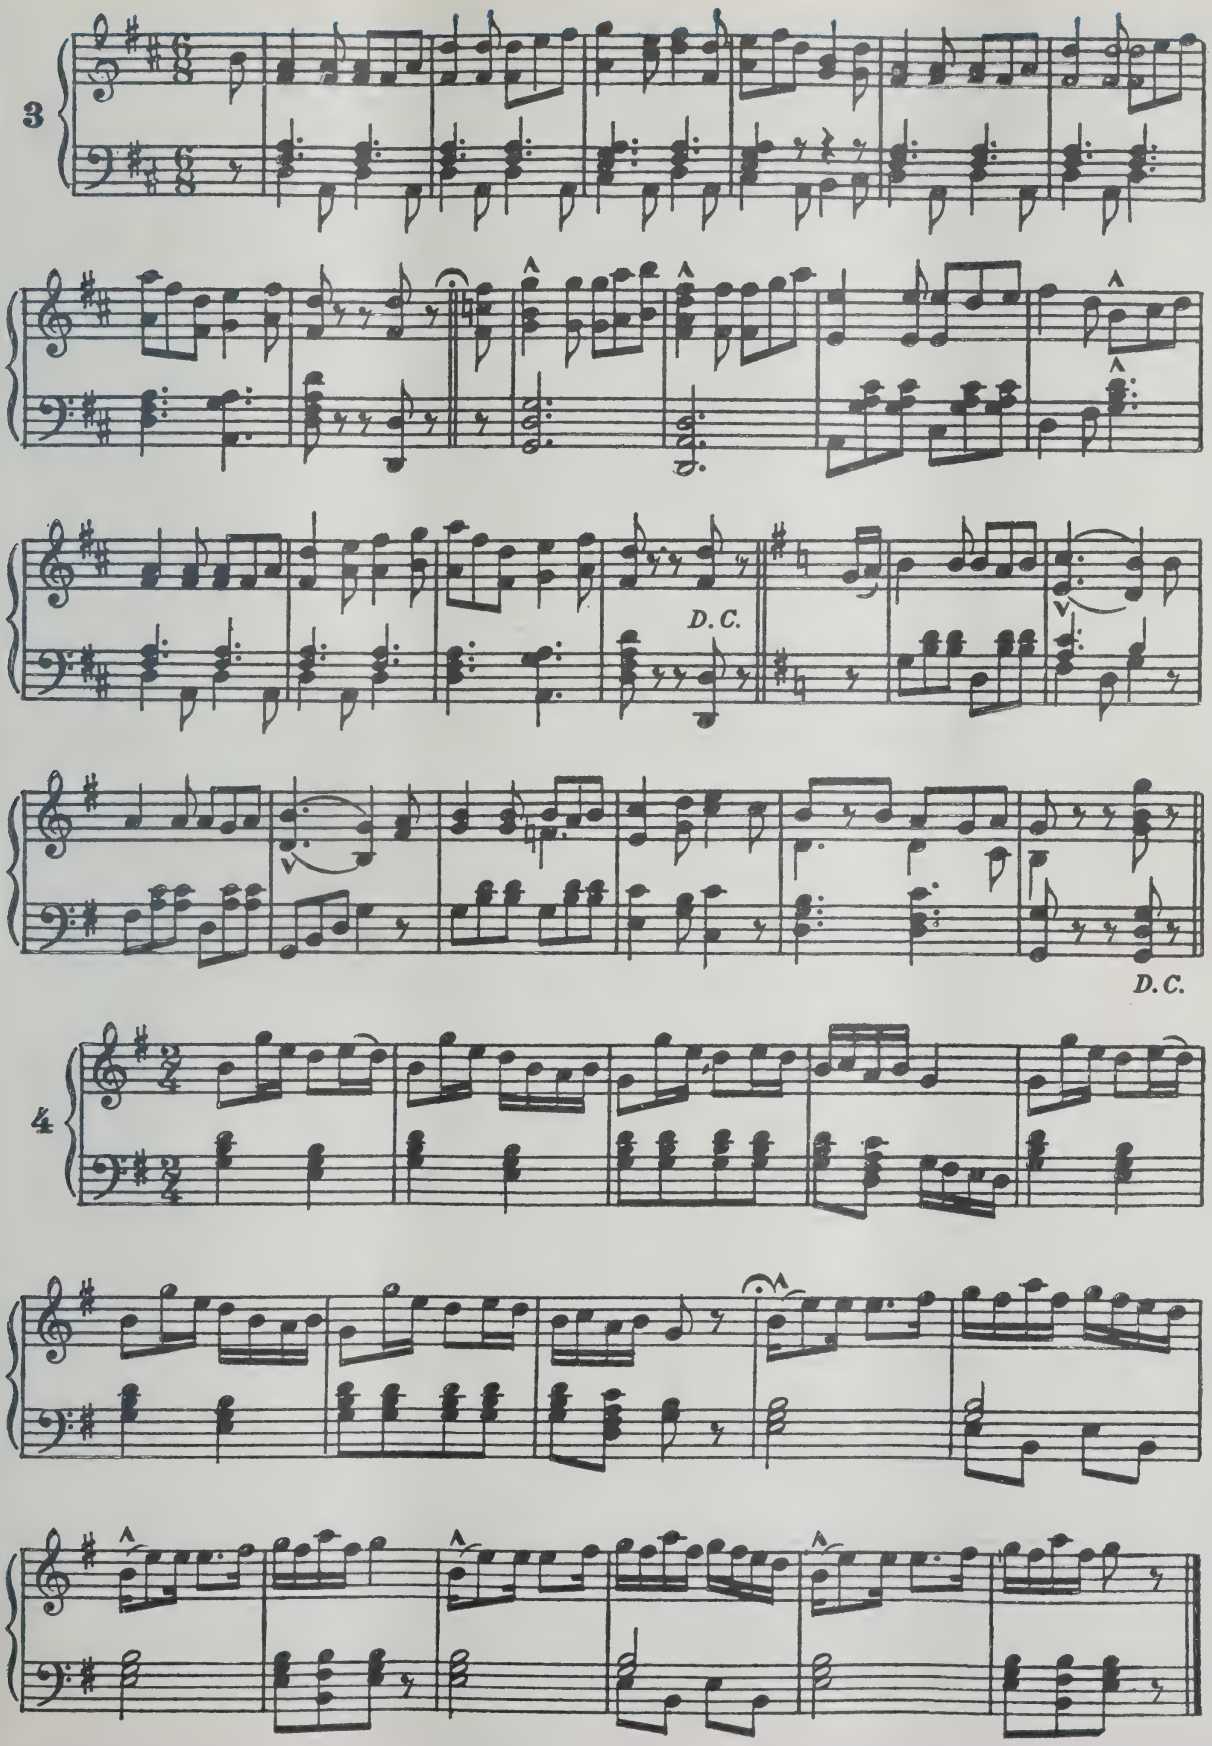
Couples will cross hands with own partner, chasse a few steps, then link arms with partner and promenade the remaining distance to seats.

### GOOD PROMPTING

This requires an intimate knowledge of music and dance construction; a good clear voice properly pitched for the acoustics of the room; a ready faculty for introducing changes as circumstances may require, and an exact sense of rhythm which will enable him to complete the call just before the strain of music begins to which the movement belongs. A good prompter if instructing a dancing class will see to it that in square dances the more experienced dancers are placed as head couples, and the others as side couples that they may have the advantage of observing others before beginning the movements themselves. The prompter should take his position at the head of the hall near the orchestra. The intelligence, ability, experience and courtesy of the prompter have very much to do with the character and enjoyment of the dance.



### SUGGESTIONS FOR FLOOR MANAGER



Floor Manager. The floor manager has full charge of all activities. He is in authority and all complaints or suggestions should be made direct to him. He sees that the sets are formed and completed and gives directions to the orchestra as to what and when to play, and has authority to change the tempo at any time. He should see that as many as possible are provided with partners as his position gives him the privilege of addressing any person in the hall without an introduction. It is usually the custom for the floor manager to instruct the leader of the orchestra to play eight measures of music of the contra or square dance, and then the prompter requests them to take partners for the dance.

ANOTHER sort of false prayers are our regrets. Discontent is the want of self-respect; it is infirmity of will. Regret calamities if you can thereby help the sufferer; if not, attend your own work and already the evil begins to be repaired. Our sympathy is just as base. We come to them who weep foolishly and sit down and cry for company, instead of imparting to them truth and health in rough, electric shocks, putting them once more in communication with the soul.

—*Ralph Waldo Emerson.*

CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD

A FULL-BLOODED Sioux Indian is a member of the Capitol police force in Washington.

OLD-TIME DENTISTS recall the days when an aching tooth was pulled, no attempt being made to fill it. They visited the patients in their homes, devoting a half-day to their office practice.

TO SHAME CO-EDS in their public use of powder puffs, lipsticks and rouge, men students at the University of California shaved in class.

ALEXANDER THE GREAT used his sword with his left hand.

FLYING while intoxicated brought a fine of $50 to a San Francisco aviator.

TWO CHESTS of old war documents recently found in Washington contain a record of the officers of the Confederate navy. Names found on other records, it is believed, will increase the pension roll paid by the southern states to Confederate veterans.

CODLIVER OIL has been freed of its bad taste due to the efforts of two chemists.

AUTOMOBILE DRIVERS in the Mohave Desert come to a full stop outside the road limits to allow others to pass.

A CAR in the center of a Rock Island freight train jumped the tracks, rolling down an embankment. Trainmen hooked the two portions together again without noticing the missing car.

HIS "constitutional right to beg" was asserted by a 70-year-old street mendicant, arrested at Dallas, Texas.

SEAMS of coal twenty-five feet thick, and fossil remains of temperate and tropical trees exist only a few degrees from the North Pole, Captain Donald B. MacMillan declared recently.

A NATIVE religious sect in Rhodesia has been combating witchcraft by throwing all suspects into the water. Those who did not survive were considered guilty.

DR. CROSBY A. PERRY, thought to be the only real son of the Revolution, died at North Adams, Massachusetts, the other day.

THE YEAR 1926 corresponds to the year 7434-35 of the Byzantine era; and 5686-87 of the Jewish era.

SOWING and planting must be done under a waxing moon, reaping and cutting under a waning moon, according to an ancient belief that still exists in certain sections of the world.

ONLY 125 Indians remain in Indiana, where LaSalle found 50,000.

CENTRAL HEATING, tobacco smoke and varying temperatures are causing deterioration of masterpieces of art which can never be replaced, according to M. Albert Flament, French painter.

THRICE since his historic trip in 1852, Ezra Meeker, who helped to blaze the trail to Oregon, has crossed the continent. In 1906 and 1910 he covered the ground by ox-team. In 1924 he covered 1,300 miles of the trail by airplane.

SPRUCE LOGS eleven feet in diameter so damaged machinery in a Western Washington sawmill that the balance of the tract will not be cut, and the grove will be made a National Monument.

DANCING MASTERS in France have applied for patent laws to protect them in new dances they may invent.

THE "SOCIAL CENTER" of New York's fashionable population is now in 68th street midway between Fifth and Madison avenues.

FOREIGN PRODUCTION of tobacco, especially in the Balkans, has increased so much since the war that American exports fell fifty thousand tons during the first nine months of 1925.

DAVID HOWARD STANDISH, of the ninth generation in direct descent from Captain Miles Standish, of the *Mayflower*, has just died.

THE FUTURE MANAGER of the hotels and dining cars of the Japanese railways is obtaining training by serving as an American dining car steward after having worked in the Waldorf Hotel from dish-washer to room clerk.

NEW YORK UNIVERSITY is sponsoring an "Around the World College" as part of its regular course. This floating university, with 450 students, will visit five continents, 35 countries, and 50 foreign ports in its 240-day cruise.

HOLLAND sends the greatest tonnage through the Suez Canal—with the exception of Great Britain.

BY CROSSING with a tree that has just been rescued from extinction in Hawaii, larger cotton plants have been produced.

TURKEY will use Roman letters in place of Arabic letters.

DRIED MUSHROOMS imported from Russia have been found in Worcester, Massachusetts, to have explosive bullets stuffed into their stems in the hope that explosions would occur either during preparation or cooking.

IT COST $3,459.21 to keep one inmate of the Home for Aged Farmers in Davenport, Iowa, last year.

A ROMAN saucepan made of clay about A. D. 100 was found in London during the excavations on the old post office site.

SNOW FLEAS can stand cold but not dryness. The skin of these soft-bodied little insects is so delicate, and evaporation so rapid that dry air is quickly fatal to them.

THE FLAG of Denmark is said to be the oldest unaltered national flag. Its cross dates back to 1219.

THE POTATO forms one-fourth of all the food of Americans and Europeans.

WHEN a distinguished visitor enters a Japanese office or laboratory he is at once served with tea.

DRAKE'S famous ship, *The Golden Hind*, was destroyed by teredos—the bivalve Mollusca commonly known as shipworms. They honeycombed its timbers with their burrows.

ACCORDING to the law in Argentina three-fourths of a wife's earnings can be taken to pay her husband's debts.

BRONZE PENS were used by the ancient Romans.

WALRUS feed on mollusks and star fish.

SCIENTISTS are investigating a process invented by a Frenchman for the extraction of pure rubber from worn-out rubber products, at a cost of only 30 cents a ton.

THE PRESIDENT of the University of Indiana deplores the passing of family prayers on the ground that, "they are occasions in which to lift the thoughts away from cares of life and to seek that divine peace which passeth understanding."

"MOST OF THE THINGS worth having—books, music, scenery, sport, a holiday with a knapsack on your back, friendship, love—are to be had for little or no expenditure of money."—*Jerome K. Jerome*, author.

# THE ESSENCE OF THIS ISSUE:

Mr. Ford's Page this week deals with the growth of leisure.

Joaquin Miller—lovable old fraud! Some of his verse will long be read, but Miller himself will best be remembered for his bombastic little eccentricities which so endeared him to the people. Here is a refreshing yarn about him—about his autobiography, which was largely fiction—and the stories with which he regaled his hearers. (p. 3)

What concessions will be demanded of the United States at the forthcoming disarmament conference? Our army is already at a minimum and our navy rendered inefficient; will foreign diplomats still try to bargain with *us* over *their* disarming. Japan has the immigration exclusion act; France has her debt; England has many hidden trading points. (p. 4)

Jews in America are awakening to the basic reasons for the antagonism often held against them. They are realizing the perils of false leadership. Many Jews themselves today are urging Jewish reforms they would not have dared a few years back. Here is an article on the present status of the Jewish Question. (p. 6)

Can the alien psychologists measure America's soul? Are the methods they use big enough to compass the spirit of this young giant of the world? By what standards do alien critics judge, when they proclaim that this nation "is not psychologically safe for democracy"? Is not their judgment as worthless as the superficial data upon which they base it? (p. 8)

Shareholders in a building and loan society—and there are nine million of them in the United States—are not mere depositors. The officers are their servants and they are responsible for their actions. Moreover they may be held legally responsible for the association's debts in case of insolvency. (p. 12)

Why should five-sixths of the rulings made by the Treasury Department be shrouded in secrecy? Why is there discrimination in applying principles differently to similar cases? Why are taxpayers forced to engage *former employes* of the Department to get what the law intended should naturally be their rights? These questions, and others, will be answered next week in a startling article on some happenings at Washington.

Lithuania—land of dark forests and bright romance, of ancient language and modern entity. We know little of this strange country where the people speak a tongue so closely akin to Sanskrit that they can converse with the Hindus of India, yet there are one million Lithuanians in America. Herewith is an article well worth reading. (p. 24)

A house in England for the summer—a ten-room stone dwelling at the seashore for $24 a week! Often we are asked about comparative prices; this story answers the queries. A housekeeper and cook at $3 a week; gas (for heating and lighting) and water at $2.53 a month. Certain other things, however, are higher than in this country. (p. 2)

A personal account of Woodrow Wilson—the man and the statesman—will form a feature of THE DEARBORN INDEPENDENT, beginning with the issue of March 27. The articles are by Huston Thompson, one of his closest friends and advisers, and at present member of the Federal Trade Commission. Mr. Thompson has done more than recount happenings; he has interpreted America's war-time President as few writers have done. (p. 20)

A new plague has arisen to harass wild fowl in their battle against extermination. With their numbers tragically thinned by their natural enemies and by the guns of sportsmen, ducks and their brethren of the air are now facing a more deadly and insidious danger—the smearing of oil waste and black grease on the surface of navigable waters by ships. (p. 16)

A pilgrimage to Selbourne, the village of Gilbert White, quiet philosopher, poet and pastor, who lived two centuries ago. A plain man who found all nature in his village and made it famous among the places of the mind. Still standing are the vicarage, where he was born, and The Wakes, where he lived for many years, and died. (p. 20)

Bryan at the convention of 1912, when he turned the tide for Wilson! Seldom has there been a more dramatic incident in political history, or a more portentous one. James Schermerhorn takes us behind the scenes at Baltimore and shows us Bryan in his moment of victory. And then the later conventions, the one at San Francisco, where the Commoner met his first great defeat within his own party, and the one at New York—his last. (p. 14)

The Virginia Reel, probably the most popular of the old-time dances, is outlined this week. It is really a simple dance to learn, yet one of the most beautiful and most enjoyable when executed properly.

# I Rented a House in England

## Showing How an Enjoyable Vacation at an English Resort May Be Spent at Little Cost

By PHILIP ROBERT DILLON

EARLY last spring I wrote, from New York, to an agent whom I knew in Somersetshire, England, asking him to secure for me a furnished house at Weston-super-Mare, a seaside city and summer resort of 30,000 population on the Bristol Channel, directly across the water from Cardiff, Wales, which I desired to occupy for three months in summer. He answered that he could get one for five pounds a week, which was equivalent to $24 a week at the prevailing rate of exchange. I wrote at once accepting it, and we sailed for England, my wife and I, arriving at Weston-super-Mare on July 15.

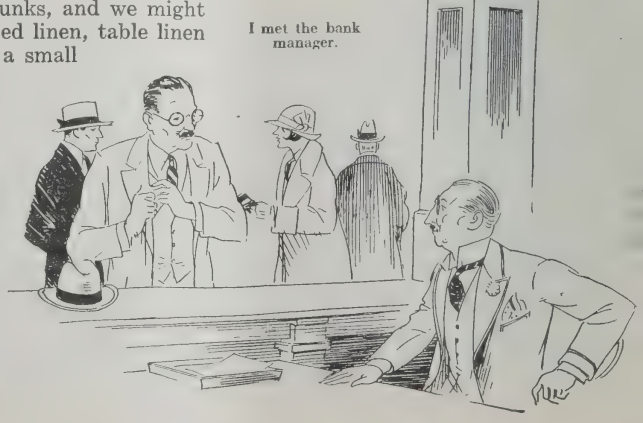
Having in mind the American furnished houses at seaside places one might rent for $24 a week in the summer season—we had never seen any except small bungalows or shacks at that price—we, of course, expected but a small house at Weston. We were quite astonished to find ourselves domiciled in a handsome stone dwelling of ten rooms, which included drawing-room, dining room, kitchen, scullery, large hall, large nursery, five bedrooms, and bath. However, the owner had reserved two small bedrooms to store his things, leaving us eight rooms.

While there was nothing very exceptional in the offering of such a house for rent, there were not a great many at that price. But an estate agent in most parts of Britain—they leave off the adjective "real" in England—would be likely to have one, or several, on his list. The English-Speaking Union, an altruistic organization designed to bring together in harmony the English-speaking peoples of the world, with headquarters at Trafalgar Buildings, Charing Cross, London, offers to put Americans in touch with responsible estate agents or directly with owners who want to rent their houses. The secretary of the Union will answer all inquiries by letter from America. No fee is asked for this service.

The decorations and furniture were of the typical middle-class—substantial and comfortable—in the style of the Victorian early '90's.

The house, of graystone, was richly dressed outside in English ivy. A seven-foot wall inclosed the grounds on three sides, and a box hedge arose above the coping of the low front wall, shielding the front garden from the street. At the rear was "the garden"—the definite article is always used when referring to the space at the back of an English house—in which were flowers and fruits.

Silver and linen did not go with the house. We discovered at once that we had committed an error in putting all our silver and linen in storage at New York before sailing. It would have been so easy to make a small parcel of silver knives, forks and spoons and put it in one of the trunks, and we might have packed our bed linen, table linen and bath linen in a small plain board box with the books and put it aboard ship with the luggage. We had much cause to regret our carelessness in this respect later in London and Paris. Linen and silver can be hired in England and France, but they are expensive and the dealers are inordinately fussy.



Fortunately, the house at Weston was well furnished with kitchen cutlery. Indeed, the kitchen cutlery of England, of the fine steel which is commonplace in that country, is quite good enough for ordinary daily use in the dining room. But there will be occasions when one ought to have silver in such a house as we rented, if one wants to conform. Americans who travel know that the English people are conventional. One does not break conventions in England. If one does it, one will quite likely be made to feel that he or she is a nuisance.

Obviously, the first business after arrival in a community where one is to remain some time, in England or anywhere else, is to establish one's financial credit. Almost the entire banking business of England is done by a few great banking concerns with headquarters in London and branches all over Great Britain. Among these great concerns are the Westminster Bank, Midland & City Bank, Lloyd's Bank, Barclay's Bank, National Provincial Bank, Stuckey's Bank, International Bank, and a few others. A branch of one or more of these will be found in every city and town of England, Scotland and Wales with a population of 3,000 or more. The business of taking your letter of credit or draft to a bank, everywhere in England, and establishing your credit, is easily and quickly done.

It was my good fortune to meet, on the day after our arrival at Weston, the manager of one of these branches, and the good impression I then received of the personnel of the

I met the bank manager.

# A Close-up of Joaquin Miller

## When the Poet of the Sierras Called to See Some Friends in Washington

By ALLAN L. BENSON

VERY few persons this season are building funeral pyres in their back yards upon which to cremate their last remains. One might canvass the whole country and not find a single back yard thus equipped. That is because America has lost the only Joaquin Miller it ever produced or ever will produce. A dozen years ago the body of our old "Poet of the Sierras" went up, one might almost say, in flames of his own making; at any rate, he laid the fagots that others, after his death, ignited. And he was just as peculiar about a number of things as he was about his pyre.

One of the most interesting works of prose that Joaquin Miller ever wrote was his autobiography, which I got him to write and for which I paid him $300 of the late Frank A. Munsey's money. Anyone who knew the gentleman who looked after Mr. Munsey's Washington cash box at that time will understand that $300 was quite a sum of cash.

*When Joaquin Blew in to Washington*

It happened this way: I was at that time editor of the Washington *Times*, which Mr. Munsey owned. One day in November, 1906, Joaquin walked in with a letter of introduction from an old friend of mine, B. O. Flower, editor of the *Arena Magazine* which was then published in Boston. Mr. Flower wrote to inform me that Joaquin was touring the East, expected soon to be in Washington, and that perhaps I could get him to write something for me. The letter of introduction that he sent along was entirely unnecessary as no one who had ever seen Joaquin before could ever forget him and I had seen him, back in the '90's, in the Bohemian club in San Francisco, at which time I had conceived quite a vigorous boyish disgust for such nonsense as his long hair, streaming down over his shoulders, and his brown corduroy suit, the trousers of which were tucked into his high boots.

All of this disgust disappeared the moment Joaquin spoke. He was very nice, very amiable and gentle, and almost the first thing he said was that we had better go out and have a drink. Having no intention whatever of affronting a great poet who was almost twice my age, we left the paper to run itself for a few minutes and were soon in a famous old place on E street which, in its day, killed more newspaper men than were killed in the Great War.

I noticed that on the ring finger of Joaquin's left hand he wore a tremendous diamond, as big as a carbuncle and flaming like a star. I had never before seen anything like it except one that Sam Shortridge used to wear, when he was a young fellow in San Francisco, and probably before he had ever dreamed of going to the United States Senate. A gunman would go crazy now to see such a ring as either of these; worth $600 then, $2,000 or more now.

Then we got down to business. Would Joaquin write something for the paper? He would write anything I said. "All right then," said I, "write your biography, and I will print it serially in the *Sunday Times* and syndicate it through other papers all over the country."

A few days later he brought down the first batch of manuscript. I looked at it and was dumfounded to see that I could not read a word of it. It was the worst writing I ever saw. He did not seem surprised or humiliated when I uttered these professional remarks. Instead, he said he would have his wife decipher it and copy it on the typewriter. His writing was "duck soup" for her; she read it without hesitation, he said.

With his help, she got through the manuscript, but he once gave me a book containing some pretty nifty stuff on a flyleaf that I have never been able to read to this day; nor could she read it all.

I shall never forget the first sentence of Joaquin's story of his life.

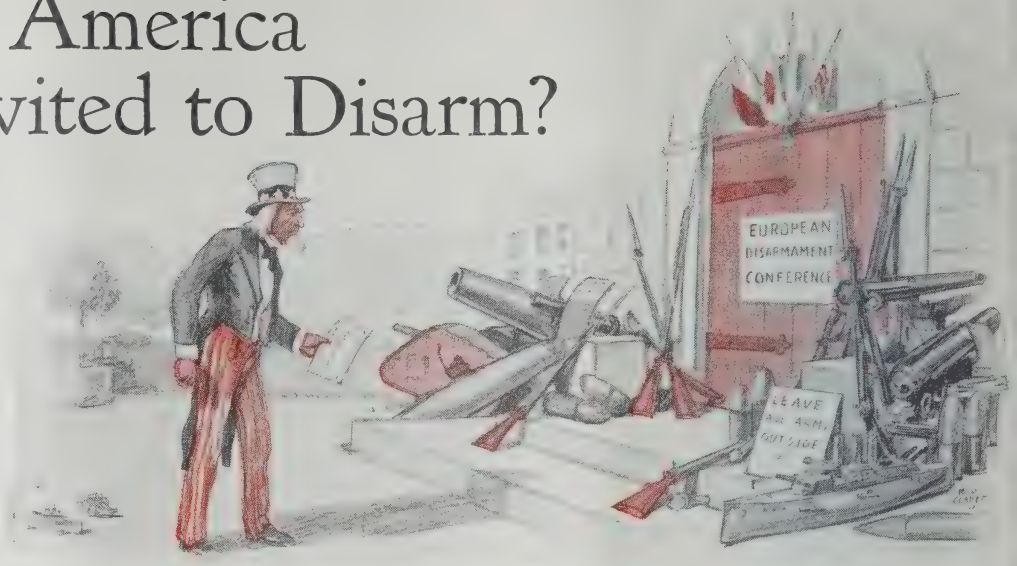
"I was born in a covered wagon pointed west," it ran.

What a sentence, what a picture—what a thing to put on a screen! A covered wagon writhing its way toward the setting sun; going down into the "valley of the shadow" with a woman. The misery and the heartache of a wanderer set off for strange lands—then the miracle and the glory! Of what stern stuff were those pioneers made. Why not call this movie "How the West Began"?

Don't call this movie anything. There was not a word of truth in it. Joaquin Miller was born in Indiana in 1841 and did not start west until 1843. He began his story the way he did because he thought it was a good way to begin it. He wanted to be interesting and he was. Furthermore, he did not think the real truth of where and when he was born was of any importance.

*What Made the Millers Move West*

In writing a biographical sketch of Joseph Lane, an early Senator from Oregon, Joaquin began: "I do not know where General Lane was born. I do not care. This unimportant fact can be found in almost any book of biographies, however." So can the facts about where and when Joaquin was born. And the encyclopedias say Joaquin did not start west until he was two years old. The family might never have moved if a Boston crook had not come along with a wagon load of clocks. He told a hard luck story about a sick family back East and induced Miller's father to take the clocks and give a mortgage upon his farm as payment. When the mortgage fell due the farm was taken. Miller told this story himself.



As a harmless (Concluded on page 26)

# Why Is America Invited to Disarm?

## She Is Already Showing the Way to Other Nations

PART II

By E. B. JOHNS

HAVING attained its objective in throttling the American Navy at the Washington Arms Conference, Great Britain immediately began "to consolidate its position" and to prepare for another advance. Japan and the other nations, who may attend the second Arms Conference, are preparing to improve their positions in the great international game of world politics. Only America is dreaming of perpetual peace.

This is what led up to the invitation to President Coolidge to attend the preliminary for the second Arms Conference. As stated in the previous article, when the first conference was called the American Navy was threatening British supremacy on the seas. It was rapidly approaching a strength at which it would be the dominating factor in the Far East. It could then really have put into effect the "open door" policy which has been, and will probably continue to be, only a fiction.

In ratifying the Washington Arms Conference, the United States surrendered this strong position in the world's affairs without any material or spiritual reward. It was pointed out in the previous article that the only reduction in the cost of the American Navy has been through the refusal of Congress to maintain it at a treaty efficiency and to appropriate for auxiliaries which would have brought it up to a treaty basis. If the Navy had really been maintained at the strength and efficiency of the British Navy since the Arms Conference, there would have been a material increase in the Navy Department budget. Eventually there would be a decrease in the cost of maintaining the Navy under the Washington Conference Treaty, but in working out the details of the scrapping program an increase would be necessary for a term of years in the appropriations for the American Fleet.

***War Department Budget Ignores War***

*Then why is the United States called into another Arms Conference?* Of course, it is not *our* Army. If the provisions of the National Defense Act were carried out the United States would have a smaller land force than most of the second-class powers of Europe. And according to Secretary of War Weeks and his successor, Secretary Davis, the National Defense Act, providing an army for the United States composed of the Regular Army, National Guard, and Organized Reserves, is not being provided for in the War Department budget.

***This Country Is Actually Disarming***

We have not even an adequate nucleus for a land defense force. By the reductions in the Army and the dangerous neglect of the Navy *the United States is actually disarming as demanded by the pacifists.* In good faith the question naturally arises, *"Why do not the other nations follow America's example, gradually disarm, and pay their debts?"*

That Great Britain is seeking to further strengthen her position in the world has been evident for some time. The peaceful pretensions which have been laid down in this country by Great Britain, France, and Japan, since the Washington Arms Conference, indicate that they have other objectives that they will seek to attain at their next conference. Prior to the ratification of the Washington Arms Conference Treaty by all of the nations, Great Britain sent a wave of preachers to this country. Every Sunday some distinguished English clergyman appeared in one or more of the pulpits in the larger cities. It is estimated that 700 came to America in the course of a year. Of course, this was not spontaneous; it was carefully organized. Japan worked through the missionary societies.

Through these agencies England and Japan were calling upon America to disarm. This, on the heels of the great sacrifice that America made at the Washington Conference, and its indifference as to whether its Navy was maintained at its authorized strength, was a curious proceeding.

The clergy were followed by English lecturers and educators. Prominent among these was Dr. John Holland Rose, professor of naval history, at Cambridge University. He dwelt on the futility of naval defense in a series of lectures. It would appear that the learned doctor might have found a great field for his crusade at home. Great Britain is impoverishing its treasury to keep a stronger fleet afloat than any other nation.

Lord Lee of Fareham, who came to America last winter, revealed one objective of Great Britain in the next conference. He directed his attack against the submarine. In a number of talks to distinguished and influential auditors, Lord Lee advocated the elimination of submarines by another international agreement. This same proposal was made by the British delegates at the Washington Conference, of whom Lord Lee was one.

***French Subs Are a Menace to Great Britain***

French submarines are a menace to the control of the sea by the British Navy. They would prove a very nasty problem in the event of war with France. Speaking on the subject at a dinner of the Philadelphia branch of the English-Speaking Union, Lord Lee said:

"At the last conference Britain, possessing a much more powerful submarine force and more efficient submarine force than any other nation, was willing to sacrifice her entire submarine force in the interest of world peace and reduction of excessive burden of taxation, but Britain's friendly advances in this respect were not met by other nations concerned. To achieve success in this one particular I believe America should approach France, and,

sing the influences which America can ring to bear on France in view of the reat obligation which France was un- er during the war and still is under to merica, I cannot fail to believe that ich approaches would be received by rance in the spirit in which made, and ould result in France's agreement to iminate her submarine force, if all other ations were willing to do the same."

It will be observed that Lord Lee rges America to thrust herself into the ntroversy over submarines between reat Britain and France. The sub- arine issue between France and Great Britain is becoming quite acute. The "obligation" referred to no doubt is the French debt.

*Taxing America to Strengthen British Navy*

e would have the United States exert nancial pressure upon France. Such procedure would open the way for a unter proposal from France for the ncellation of her debts by the United tates. France professes to be in sore nancial straits and might enter into a bmarine agreement if her debt were nceled.

Of course, this would be taxing merica to increase the strength of the ritish Navy, but that was exactly hat took place at the Washington rms Conference. Incidentally, can- llation of the French debt would reatly enhance the private American vestments in France, while it was re- oving the submarine menace to the ritish Navy. What a combination of ternational bankers and English dip- mats will do in secret agreements, nly the *results* of the second Arms onference will tell.

Another factor in the situation at e second Arms Conference that must e taken into consideration is the con- ssion that will be necessary to make Japan, if she approves any agreement r the elimination of submarines. It ould be borne in mind that the sub- arine has a very important function in e plans of the Japanese avy.

Japan is building bmarines with a fever- h haste. Submarines are so a vital factor in the efense of the long coast e of the United States. ith submarines the de- nses of Manila and the hilippines could be rengthened. *The defense America of course will t be pressed by the Amer- an delegates or receive any rious consideration at the nference.* Any one who ggests that the United ates should have an ade- uate Army or Navy would e immediately classed as militarist. It is not nec- ssary here to consider hat submarines amount in the defense of the nited States of America.

What must receive consideration by the Conference will be the price demanded by Japan for the elimination of her submarines. A recent survey of the reception by the press of Japan of the second Arms Conference proposal reveals that there is a sentiment in that country in favor of holding all arms conferences *under the League of Nations.* The United States is urged to join the League of Nations and make any move toward disarmament through that organization.

*Japan Trots Out the Question of Immigration*

The immigration question is also brought to the front again quite prominently by the Japanese press. Several influential papers insist that it is an international question. There can be no peace, it is insisted, until the ban placed by the United States on Japanese immigration is removed.

The comments by the Japanese papers should be taken seriously, as they are more under the control of the government than are American publications. It is insisted by the *Osaka Asahi* that:

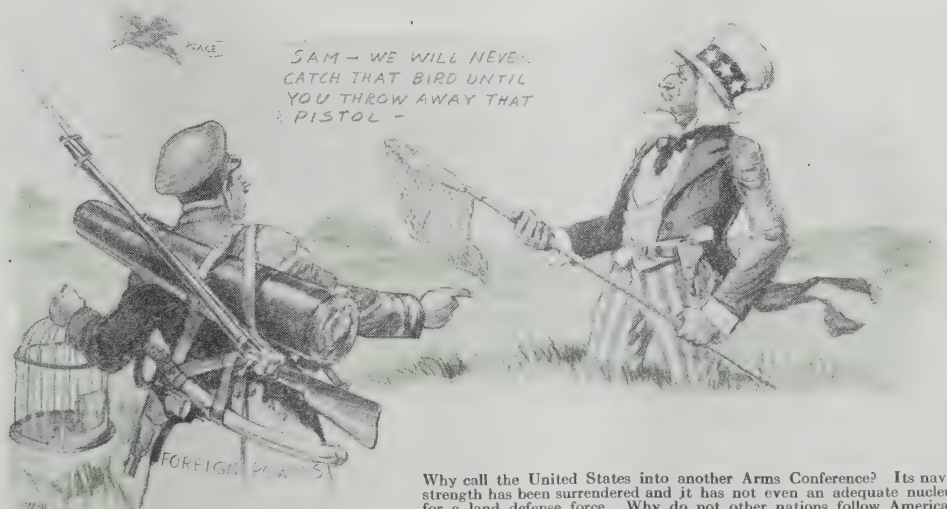
"The United States is not in a position to promote such a conference because of her injustice towards Japan, by which the United States legislature passed the immigration law including the Japanese exclusion clauses. She has sown the seeds of discord between our two nations. We are not pleased with the selfishness of the United States, who does not care for international morality when it is inconvenient for satisfying her greed.

*Some Comments by the Japanese Papers*

"The ill-feeling which the enactment of the immigration law excited, and the American boycott movement which the American injustice encouraged, now appear to be largely abated, but they have not been dispelled. External anger has subsided into internal animosity. We shall never forget the ignominious humiliation. As long as inward resentment lies hidden deep in our minds, the dark shadow of enmity will not be struck out of our mutual relations.

"The shadow must be taken away in order to improve Japanese-American relations and to promote the peace of the world. However successful the participating Powers may be in limiting the number of auxiliary vessels and in revising the Washington Treaty, international peace will not be established. Let it be supposed that an opportunity will come at which the United States can justly claim the promotion of an international disarmament conference, and that will be the time when she repents her injustice and when she will have revoked the immigration law. The shortest cut to international peace is the elimination of the causes of war rather than to limit armaments."

*Eliminating War Causes Brings Peace*



How easily a domestic question may become an international one, depending on the point of view of the man that is making the argument, is shown by the position taken by this paper. It speaks "of the freedom of migration" as a "divine right of man."

It continues:

"It is one of the fundamental rights, so-styled, in the United States Constitution. This is a question common to all human beings. The immigration law enacted by the United States is contrary to this great principle, yet she is mentally blinded in insisting that the adoption of the law is purely a domestic affair. This argument is absolutely illogical. Just as individuals composing society have no absolute liberty, no nation who is a member of the international community is entitled to absolute liberty.

"A concession in order to assure the fundamental rights of men, irrespective of nationality, is the primitive definition

(*Concluded on page 23*)

Why call the United States into another Arms Conference? Its naval strength has been surrendered and it has not even an adequate nucleus for a land defense force. Why do not other nations follow America's example—gradually disarm, and pay their debts? Then would the dove of peace find a resting place.

# What About the Jewish Question?

## A Frank Exposition of the Present Status of This Situation

"I SEE you have an article on Rabbi Klausner's new book," said the office visitor, "and you treat it very fairly. Tell me, how did the impression arise that your paper was ever unfair to the Jews?"

"Is there such an impression?" we asked.

"Well, probably not now, but you know there was a time when you were subjected to a good deal of criticism because of your Jewish articles. After that the report was spread that the Jews had forced you into silence."

"You can put it down as pretty certain," we replied, "that we were not forced into silence by anyone. There are two reasons: First, we have not been silent; second, there is no force that can compel THE DEARBORN INDEPENDENT to be silent on any vital public matter. We want, if we can, to set an example of free speech in this country; but we feel that speech, to continue free, must always be fair."

"Then, why was there so much criticism?"

*Jewish Religion Was Not Being Attacked*

"There was not any single reason, but a number of them. The Jews themselves said that we were joining in the persecution of a downtrodden people. Their principal men were able to bring political and financial pressure to bear on prominent Christians to repudiate the idea of persecution of a minority. They even drew up public pronouncements. They induced William Howard Taft to deliver an address on the subject which he did with admittedly no study of the documents involved. We ourselves could have signed all the protests against persecution, for we do not believe in it and have never engaged in it. Then there was the opinion based on misinformation that it was the Jews' religion that was being attacked. Far from that, we have always held that a Jew who followed the Mosaic law and the Prophets' teachings would be unexcelled as an American citizen. Besides, there was the flabby moral condition of the American mind which made it unpopular to hold any opinions that tended toward disagreement. Gentiles had so far succumbed to pro-Jewish propaganda in this country that even to mention the Jew in any tone but that of extravagant praise was to commit a breach of propriety. It even went so far that a university president in an eastern state said that it was dangerous to mention the Jews at all. So that all that was said on the subject was said by politicians looking for Jewish support or by the Jews' own numerous press agents. Any American newspaperman will know what is meant."

"Well, what was it that you had against the Jews, anyway?"

"We had nothing against them as Jews. That would be foolish. If you have read the numerous Jewish books which have appeared during the past five years, you will see that the Jews themselves have wrestled with the question of why their presence creates criticism.

*Jews Are Liked When Acting Like Americans*

"Some of the writers have been honest enough to deal with palpable Jewish faults; others have contented themselves with repeating the century-old explanation that all other peoples are jealous of the Jews because the Jews are abler, smarter, quicker, more successful than they. Dislike is explained by the fact of unlike'; that is, that the manners of Jews are different, that they are foreigners. Now, as a matter of fact, Americans also are disliked where they are foreigners. As to the Jews being smarter, we have never been convinced of it. We don't think they are. When they play the game according to American standards, they are on a level with other people. But when they throw aside our principles, they make a shoddy success which is not lasting. The worst effect of this is that they sometimes influence Americans to lower their standards to meet the Old-World practices which many of the Jews bring with them; and this, of course, has a bad effect all round."

"You were not conducting a campaign against Jews as Jews, then?"

"Not at all. How could we have hoped to convince people of the truth of what we were saying, if we had done that? A Jew is a human being. He is known of his neighbors. Americans do not take anyone's word against people they know. There is not a Jew in America who can say that he has been at all discriminated against because he is a Jew.

*In All Great Wars There Were Directing Minds*

But many of them have profited by seeing themselves as in a mirror, and have corrected—or have begun to correct—many of the things which they saw were out of place here. That is, America has been making its way into their minds, and we believe that in the long run they will see that THE DEARBORN INDEPENDENT has been rather a courageous friend to them. It takes more friendliness to point out faults than to gloss them over. Anyone prejudiced against Jews as Jews cannot discuss them fairly or intelligently."

"Can you tell me, then, just at what you were aiming?"

"Yes, it can be stated very simply. The Jews had been taught for centuries that they were in the world, but not of it. The rest of the peoples were benighted. They were inferior to the Jew in every sense. Their nationality meant nothing. The nations were, to use the Old Testament word, 'strangers' to whom it was lawful to do things not lawful to be done to fellow-Jews. This feeling, the higher it went in Jewish finance, spelled enmity to Christian civilization. It made the Jew a victim of that attitude called super-nationality; that is, he was among all nations but allied with none. In war, it was not his fight, but the fight of nations with which he had nothing to do. It has been said for centuries that Jewish financiers have been the beneficiaries of wars. There must be some foundation of truth in a conviction that lasts for centuries. There were evidences of it in the last war. What we were trying to do was to unravel the confusion of the world by showing that in all these great tumults there were directing minds, schooled through centuries to know just what to do. Take a family like the Rothschilds, or the Warburgs. They have dealt with governments for generations. They know all the secret springs.

*Jews Predicted the Coming of World War*

International finance, which is a mystery even to some statesmen, is an open book to them. We have shown by Jewish publications that the World War was predicted by Jews years ahead, and not only that, but the results of the Peace Conference as well. We have shown that the destruction of Russia was not an accident, nor yet the results of a popular uprising of the Russian people. We have shown that at the heart of world affairs was a dangerous power, which once seen and known was shorn of half its power. In showing this, we have helped the Jewish people to see that much of their leadership, particularly in politics and finance, was the worst kind of leadership they could have."

"Oh, that is the 'international Jew' that you talked about?"

"Yes. Just as in Germany the Prussian power and the Prussian idea were superimposed upon the German people, who are inherently a good people, so in Jewry this international power follows a program which brings inevitable odium and suffering to all the plain Jews. And just as President Wilson succeeded in showing the Germans the difference between Germanism and Prussianism, so we have sought to show the difference between Jews and international nationalists. We believe that the Jews are beginning to see it. It was most natural that the Jewish leaders should

do all in their power to misrepresent not only our motives, but all our statements (millions of Jews not being English readers) because once the multitude of common Jews saw the point, the power of international Jewry was in danger. And you may take our statement as fact that many, many Jews have seen the point, not only in this country but elsewhere, and the power of the international leaders is at the beginning of its end."

"Is there no way for you to get this idea more rapidly into the minds of American Jews?"

"No, so far as we can see. These great results are not attained at once. There must be time for the facts to penetrate. During the period that our articles were appearing there was vehement protest and denial. Since that time, however, Jewish leaders of the better sort have been repeating some of the very things that we said."

"I have heard that the articles were first inspired by a personal pique of some sort."

*The Reason for International Jew Articles*

"That was one of the stories circulated. It was said in one report that financial pressure was the cause of it. Another report said that disappointment in Madame Shwimmer's representation was the cause of it. There were many such imaginative attempts to account for the articles. But there is not a shred of truth in any of them. The work did not arise out of dislike, prejudice, revenge or anything like that. It arose out of the solemn conviction that the time had come for someone to clear the air by speaking out, by speaking such things as any American could confirm by his own observation. That was the sole reason for the articles being printed. It can be further said that the greatest restraint was practiced in all that was presented. We resolutely cast aside the sensational, the curious, the more arousing facts. Our purpose was not the embarrassment of our Jewish citizens, nor yet to engender suspicion and dislike in our Christian citizens. It was simply an effort to take time by the forelock and do in America in the right way what was sure sooner or later to be done in the wrong way. If the work had not had elements of benefit to the Jew as well as to the others, it could not have lived; it could not have gone on justifying itself to an increasing number of both Jews and Christians as it has done."

*Socially Minded Jew an Asset to America*

"Where do you stand with reference to the Jew now?"

"Just where we stand with reference to any other human being. A socially minded Jew is an asset to America. There are many such. We can quite understand the bonds of racial loyalty which made them cling to their people while denouncing us. But clinging to their people and clinging to the anti-social attitudes which have prevented their people—as a people—from winning the esteem of the nations are two quite different things. There are many, many Jews of the highest honor and character. Those of the rank and file are hard-working and honest. They have a place in America. They can become highly useful to America. But they cannot do that by insisting on Judaizing America, for that cannot be; it is not written in the stars. There are Jewish working men and women by the millions, professional Jewish men by the thousands, who do not approve the 'international' idea. They want to be Americans; they want their children to be Americans. And if there should ever come a day in America when the principle of equal rights to the Jew is endangered, THE DEARBORN INDEPENDENT shall be found quite as powerful in their defense as any that they can look to. We do not say they should cease to be Jews. We do not say that they should 'amalgamate.' We do not say that they should flock by themselves. We only say that they should regard themselves as participants on equal terms with others in the responsibilities of maintaining American ideals and in the enjoyment of them. We do not approve social ostracism for the Jew because he is a Jew. It is only too evident that certain social clubs which debar Jews from membership admit Gentiles who are a disgrace. Character, and character alone, should be the measuring rod. We know too many Jews of character to be ignorant of the heights to which Jewish character can attain."

*Thousands Want to Be Americans*

"What will your future course be?"

*It Is the Gentiles Who Need Attention Now*

"That depends altogether on circumstances. We may say this, however, we do not expect it ever again to be necessary in America to repeat the thorough-going discussion in which we engaged. If the Jews are wise—and we think they are—they will finish the work themselves. There is a great deal of self-criticism going on among them now. Statements which would have roused the most angry condemnation, had they been made in this paper, are now being made in the Jewish press by Jewish leaders. That is what we mean by the Jews themselves finishing the work.

"It is the Gentiles who need attention now. They require a thorough overhauling to disclose wherein they have slumped. They need to be pricked in their pride and their honor until they wake up. And when we start this, there will then be no question as to whether we are motivated by good judgment and intention, and fully equipped with the facts. We have coined the term 'Gentile boobs,' and we think it is entirely fitting to great sections of our people."

## Dr. Johnson as Dr. Pomposo

HITHERTO unknown sketch of Dr. Samuel Johnson, in the character of Dr. Pomposo, a name which Churchill had given to Johnson, is found in a novel in the picaresque style, the third edition of which, published by John Murray, in 1786, has just come into the rare-book market. This novel is entitled *Modern Times* or the *Adventures of Gabriel Outcast*, supposed to be written by himself in imitation of *Gil Blas*. The author was John Trusler (1735-1820), an eccentric divine.

Every Johnsonian will recognize more than one trait of the master in the following humorous excerpt from Trusler's *Modern Times*, which in no way detracts from his reputation as a "hard-boiled" philosopher:

He told me he was going to pay a visit to his friend Dr. Pomposo, a very extraordinary character, though of great erudition, and asked me to accompany him. Wishing to be acquainted with men of learning I accepted his invitation and cheerfully went with him. When we reached Pomposo's house I was introduced to him as one of the *literati* whom he must be proud to receive. He never moved from his chair, but (which was in him a great mark of condescension) desired me to be seated. He had several persons with him, and each had a pocket-book and pencil in his hand. On our being seated among the rest, he grumbled forth, "That the *literati* of the present times were but few; that the era of learning had long gone by, and that latter pretenders to it were but quacks in the republic of letters, that literature had been poisoned by the modern dispensers of words; and that without speedy correction and illumination in science, we should fall back into the barbarities of darker ages."

Scarce did he utter a word, but every one in the room, except ourselves, had his pencil to his paper, and was copying from his mouth, as if he had been an oracle. The persons present, I found, were a parcel of scribblers who by adulation and praise were admitted to visit him, and who, by starting different topics, generally brought away with them a much greater store of ideas than they carried there.

On my observing to my new acquaintance, that, though education generally polished the manners of the world, it seemed with respect to him to have lost its influence, for that he appeared to me to be quite a cynic, and a *Hottentot*, he admitted my observation to be just. "With all his learning and his knowledge," says he, "he is a bear in his manners and looks down with an affected pity on men who have little else than their rank or their fortune to distinguish them."

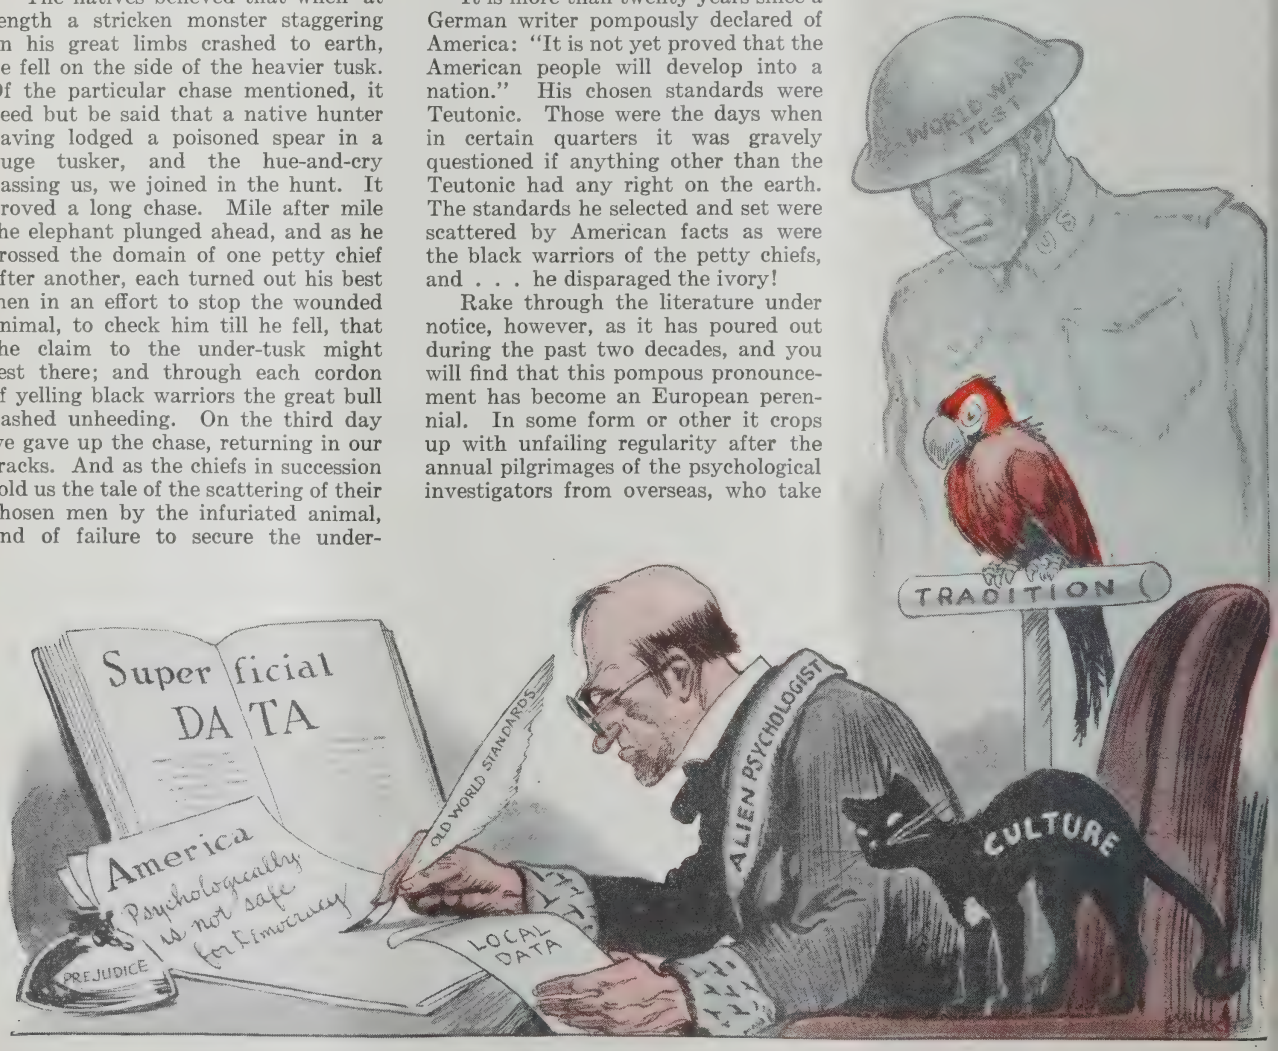
# Measuring America's Soul

## Can Alien Standards Produce Accurate Tests When Applied in Ignorance and Misunderstanding?

By T. CAMERON TAYLOR

TRAVERSING the rank field of alien literature on the subject of American psychology, carefully and with due respect, I am reminded of a stirring elephant-hunt in a dark corner of Africa in the not far remote days when the chief in whose ground a hunted elephant fell claimed the under-tusk. The claim rested upon the fact that the wild elephant, in his rooting and digging for salty earth, usually used one tusk more frequently than the other—became "right-handed" or "left-handed"—and that the tusk most used, while it might not appear the bulkier of the two, was always more heavy and of beautiful, close-set, solid ivory.

The natives believed that when at length a stricken monster staggering on his great limbs crashed to earth, he fell on the side of the heavier tusk. Of the particular chase mentioned, it need but be said that a native hunter having lodged a poisoned spear in a huge tusker, and the hue-and-cry passing us, we joined in the hunt. It proved a long chase. Mile after mile the elephant plunged ahead, and as he crossed the domain of one petty chief after another, each turned out his best men in an effort to stop the wounded animal, to check him till he fell, that the claim to the under-tusk might rest there; and through each cordon of yelling black warriors the great bull dashed unheeding. On the third day we gave up the chase, returning in our tracks. And as the chiefs in succession told us the tale of the scattering of their chosen men by the infuriated animal, and of failure to secure the under-tusk, or a substantial consideration therefor, there was invariably forthcoming a comment based less upon observation than upon chagrin: "The ivory did not appear to be good."



The chase through the mass of published comment of alien writers on the psychology of America, in quest of exact evidence as to the depth and breadth of the tests to which they had subjected the American mind, and the further quest of proof of the validity of the standards they applied, brings vividly to mind the petty chiefs stringing out their selected warriors and seeing them scattered, and the subsequent disparagement of the ivory they did not get.

It is more than twenty years since a German writer pompously declared of America: "It is not yet proved that the American people will develop into a nation." His chosen standards were Teutonic. Those were the days when in certain quarters it was gravely questioned if anything other than the Teutonic had any right on the earth. The standards he selected and set were scattered by American facts as were the black warriors of the petty chiefs, and . . . he disparaged the ivory!

Rake through the literature under notice, however, as it has poured out during the past two decades, and you will find that this pompous pronouncement has become an European perennial. In some form or other it crops up with unfailing regularity after the annual pilgrimages of the psychological investigators from overseas, who take a brief holiday and an ocean voyage to measure America's soul.

The characteristic vagueness of the charges of America's psychological unsoundness has always been baffling, but at length there has come an assertion definitely worded and straightly stated, capable of being handled, and—more happily still—susceptible to test by a standard applicable to the democracies of the whole world: "America is not psychologically safe for democracy." The test will be applied in due course. Meantime what of the validity of the standards applied by the psychologist spectators in measuring America? Where and of what was it formed, this Micrometer of the Mind which reveals America as psychologically inadequate in a vital aspect. Was it in lands "psychologically safe for democracy"? Was it made in Europe, and of the traditions, mentalities, ideals and standards which have democracy there "safe" in battle-line, bread-line, and dole-formation?

# MR. FORD'S PAGE

THE trend for many years has been toward more leisure for all the people. The story of this trend through the generations discloses to us most of the follies and most of the nobilities of human society as it has wrestled with its economic problems.

Nature fixed the first limits of labor, need the next, the inhumanity of man to man had something to do with it for a long time, but now we may say that law—economic law, as we are beginning dimly to discern it—will do the rest. The history of leisure is the story of man's long groping after the law of leisure.

The gain consists in this, that with discovery of some elements of the law of leisure, there ceases at once the condition in which one class of people becomes the law for another class of people. That is to say, it will no longer rest with one class to determine what is good or what is harmful for another class, because the law of the matter determines what is good for both of them.

Perhaps it is better to illustrate this. There was once a general opposition to the number of holidays in this country, based upon the abuse of leisure which was justly chargeable to large sections of our population. The leisure time did more harm than good, the better observers said. Just now in France a learned professor is accounting for the increased consumption of alcohol by pointing to the eight-hour day, which he denounces as a device which gives workingmen more time to drink. It will be generally granted, as a practical thing, that if men are to drink their families into poverty and themselves into degeneracy, the less spare time they have to devote to that purpose the better.

That is the way various things are tangled up—leisure and dissipation—so that often one cannot make a given improvement until certain other improvements precede it. If people are to have leisure, they must have means to make it useful rather than destructive. And, as a general thing, in order to learn how to use leisure, they must have leisure to experiment with. That is how we viewed it in this country at least, for we began the experiment of leisure even while there yet existed the abuses which had made leisure such a dangerous thing for large sections of the community.

There were people who saw the danger of it; there were people who saw the good of it. They were both right: everything that is good is also dangerous, when mishandled.

The motives were mixed. Those who thought that leisure was harmful usually had an interest in the products of industry. The mill-owner seldom saw the benefit of leisure time for his employes, unless he could summon up some rare feeling of humanity. But humanity is not a perfectly effective motive, because it is subject to moods of feeling and is not necessarily based upon the solid foundation of law. This was the weakness of most of the pleas for leisure for the working class, they were based upon sentiment.

*AMERICANS of every class have more spare time than the people of any nation in the world. By abolishing the abuses which made the leisure of the people to be periods of disgusting debauch and destructiveness, we have removed the last big reason for any class to say of another class that leisure is injurious to it. But leisure is by no means secure as long as it is regarded as a privilege forced by the demands of a class. It is not secure as long as industry regards it as "lost time." There is a law which definitely relates leisure to economic well-being and this week's Page is an introduction to that law.*

Taking it altogether, everybody viewed leisure as "lost time." It was time taken out of production. It was a suspension of the proper business of the world. Everybody looked at it that way. The thought about leisure usually went no further than that here were hard-driven working people who should have a little surcease from their labors; the motive was purely humane. But it was felt to be followed at a considerable cost. There was nothing "practical" about it. The leisure was regarded as a "loss."

The concern felt on the matter, however, was an indication of the way affairs were moving. And as is usual in such matters, to move one thing requires that other things must be moved to permit it. A number of things changed at the same time in this country. There began a very spirited and successful campaign against those influences which had degraded the leisure of the people. One after another these influences were brought under control. In course of time, even control was adjudged as insufficient; nothing but complete abolition would suffice; so these influences were abolished.

There remained no big apparent excuse, then, for any class to say of another that leisure was a detriment to their character. It is admitted on all hands that, while much of the leisure occupations of the people is sheer frivolity and trivial nonsense, there is a larger percentage than ever before who are capable of making their leisure count. That is, our people are becoming more and more expert in the effective and profitable use of leisure.

But leisure has still another value, which should be studied. We shall return to it in another week.

## *Ancient and Holy Things*

WE OUGHT to keep them forever—ancient and beautiful things.

There are no songs being written in this Jazz Day that compare with the old songs that grew up out in our own country. What Jazz songs compare with the plaintive, melancholy, and the deeply moving melodies like "Swing Low Sweet Chariot"; "Nobody Knows De Trouble I's Seen"; "I Can't Hear Nobody Pray"; "Singin' All Over God's Heaven"?

Just now, there is a revival of interest in the Negro Spirituals. A dozen books have been published recently on these Spirituals. We are beginning to put a proper valuation on our ancient and beautiful things.

There is a national revival of the old American dances; they are finding their way back to their place in the heart of America.

He who saves for America the old music, the old songs, the old hymns, the old customs, the old recreations, the old wholesomeness and freedom, is making America his debtor.

---

## *A Way We Have in America*

IN HUTCHINSON'S book *One Increasing Purpose* there is conversation about smoking in the presence of ladies.

It is carried on in the home of an English nobleman of high repute. The visitor, Mr. Simon Paris, is struck by the fact that the men do not smoke until the women go. The man of that home, Sir Henry, says: "We have a custom of not smoking until Mother and the girls have gone from the room and then we smoke like chimneys. It is just a little way we have."

We once had "a little way" of that kind in the United States of America. It rather became us, too. Sometimes we pretend that we are forever "off" the puritanical, as we call it, but we cannot quite forget the cleanliness and courtesy of the home dining rooms where the younger sons did not blow smoke, between courses, around their mother's and sisters' faces.

Women in these United States do not smoke with very much grace. A European said: "American women are cigaret wasters."

When we innocently asked him what he meant, he said, "They don't really enjoy cigarets. They don't inhale them down deep into their lungs as if they tasted good. They nibble at them. They waste good cigarets. American women never will be able to smoke cigarets with any great naturalness or any great joy."

We don't think they will, either.

Our European knows exactly what he is talking about, because his women smoke naturally. Ours do not. It is still "A little way we have."

---

## *The President Speaks—or Echoes?*

MR. COOLIDGE can speak when he wants to. It is unfortunate that so often the impression is given of his talking in someone else's footsteps, so to speak. The President's good word for Italy and Mussolini would have been much more effective had not Otto H. Kahn said all those things before him, and had not the press of the country, with singular alertness, caught the deep alliance between American diplomatic favors and the trend of American bankers' loans. We do not like that "dollar diplomacy" which makes the State Department and the President the private and disposable appurtenances of international bankers. We do not like to see Otto H. Kahn speak first on grave international matters, and our President follow quickly with a "yes, yes."

If Mr. Coolidge would show some independence in these matters, his situation before the people would improve. If, for example, he would speak a good word for a worthy nation of which the international bankers refuse to speak a good word, it would indicate independence. To make it very plain, if by a single act Mr. Coolidge would indicate that his entire foreign policy is not dictated by the desires and demands of international bankers, mostly Jewish, the above comment would lose its point. But it retains its point while the case of Poland exists. Poland is a Christian nation, which has served humanity well as the bulwark against which the westward storm of military bolshevism broke itself. Overrun by four armies, yet repelling every enemy of Christian civilization, Poland has suffered extremely but has never surrendered, nor has she asked the world to compromise her debts. Poland has always paid. The virtues of the Poles are known by the several millions of them resident in the United States. As deserving allies and dependable debtors, they are without superior among the nations.

Does anyone in this Administration speak a good word for Poland, or make easy a good deed for Poland? No. Has Mr. Coolidge done so? No. Will he do so? Not unless he is able to defy the international banking group which, *by order of its Jewish members*, has decreed that Poland shall not be helped. The Republican Administration does not feel strong enough or free enough to defy that money group. Mr. Coolidge, we make bold to say, is fully aware of this. But, if Otto H. Kahn, or even Barney Baruch, should one day turn with warm attitude of friendship toward Poland, we should then expect an answering echo from the White House.

The President will not go far, at home or abroad, talking in these men's footsteps.

---

## *"Thinking Internationally"*

A DEAR lady writes us with something like tearful anxiety, bidding us "think internationally." She desires that *everybody* "think internationally"—but just what she means by the phrase she does not say. It would be ungracious to look over the lady's shoulder, but we could make a good guess as to the names of the periodicals and pamphlets which she has been reading, for we also have followed their effort to have the American people "think internationally." And neither do they tell us what it means. It is a delightful, mouth-filling phrase much used by "liberals"; but what does it mean?

If it means *to think as Europe thinks*, we must decline: Europe's plight is due to the quality of Europe's thought. We shall avoid that plight by avoiding that thought. We know what France thinks. We know what Russia thinks. We know what Italy thinks. We know what Germany thinks. We know what Czecho-Slovakia, Greece, Bulgaria and Austria think.

They all "think internationally." In fact, they do nothing else. International diplomacy and international finance are the curse of Europe. Money and force are their elements. Russia is a particularly brilliant illustration of a government that "thinks internationally." And France comes next. Not to speak of that commanding figure, Mr. Mussolini, who sometimes thinks internationally to such a degree that it becomes embarrassing to the objects of his attention.

So that if to think internationally means to think as Europe does, it is safe to say that the United States will continue to refuse to do so.

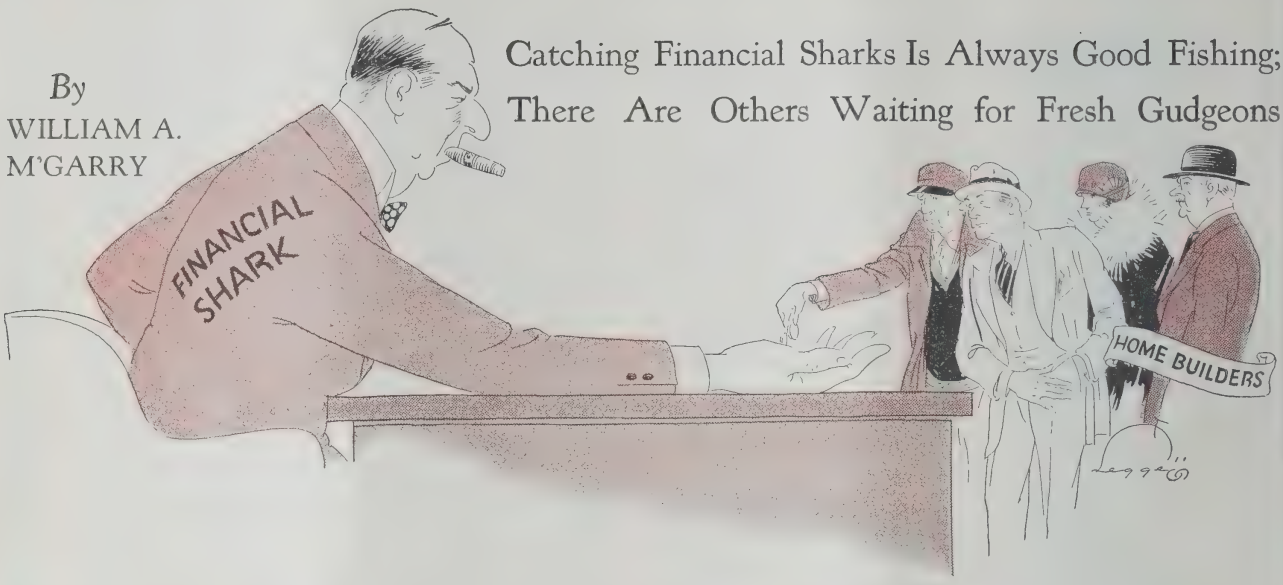
If, however, it means *to think about the international situation with understanding and good will*, it may be said that our people are doing that, and with good results. We are perhaps better equipped for that kind of thinking than any other nation. In the first place, we are international. Our population is made up of all the races under heaven. We have in our midst the ruling and the subject peoples. We have, as a nation, a first-hand slant on every national situation. We have descendants of the British stock who can judge British facts and tendencies. We have Italians who can judge Italy from the American point of view. We have Germans who can measure Germany by the standard of this Republic. And so on, through the list. We thought internationally in 1776, and in 1898, and in 1914, and in 1917, and have done so ever since. In fact, it is only recently that any nation comparable with us in power and influence has thought internationally, in the modern sense. When a few of them tried it, Locarno was the result.

And the sum of *our international thinking has been American thinking.* That is, we have thought of international matters as Americans. Not as Europeans, not as internationalists, or anti-nationalists, or pro-nationalists, but as Americans. Wherever we have touched the life of the world for good we have done so by standing upon the American principle, and not upon any other. The more American we have been, the more practically useful have our proposals been. We have faltered and caused confusion only when we have acted on the principles and views of peoples who are buried under the traditions and prejudices of their past, people who have lured us to partisanship in quarrels which are not ours. When we have gone to Europe with our own minds and our own principles we have always been able to suggest or do something that has helped to clear up the gloom.

And that is the only kind of "international thinking" that America can afford to do, if her motive toward the nations is one of good will.

"Think internationally" is a weasel-worded phrase which conceals implications that it dare not express.

It needs to be challenged, clarified and defined.



Think as Americans, *think forth from the American principle*, the American experience, the American motive *about the international plight*. Think about that plight, to be sure, but as Americans.

But to take the international plight, fallacies, and untruths, and think forth from these as a basis, is fatal both to Americanism and to the world. We strongly suspect that what our friends the propagandists want us to do is just that.

# Some Building and Loan Pitfalls

## Catching Financial Sharks Is Always Good Fishing; There Are Others Waiting for Fresh Gudgeons

By WILLIAM A. M'GARRY

NINE million building and loan shareholders in the United States who naturally want to keep this form of savings free from the manipulations of financial sharks may be helped in their endeavor by an understanding of just what happened in Philadelphia, where twelve men went to jail a few weeks ago for the confessed looting of seventeen building and loan associations.

Since the men confessed—after two of them had been convicted in a bitterly fought trial—it has been generally assumed that the whole story appeared on the surface. The fact is, however, that hardly anything has been published about the fundamental cause of the crash—a series of operations within the law, yet utterly at variance with the original spirit and purpose of the building and loan system.

If this omission stood by itself it might be ascribed to the overshadowing interest of developments during the trial. But now that the trial is over and the swindlers are in prison cells, another and even more significant evidence of the "soft pedal" has come to light in connection with the plan to rehabilitate the seventeen defunct associations. It was found impossible to conceal the crimes committed, but every effort is being made to minimize their lesson by avoiding open discussion of the reasons for these crimes, and the inevitable effect of them.

Obviously, this is the only information that can be of any use now to the shareholder in preserving the recognized financial soundness of the building and loan system. It is to his interest to know what made the swindle possible, and what it is likely to cost. If he has that knowledge he can prevent a repetition elsewhere. Without it, as will be shown, he is dependent on the personal honesty of directors and officers to a far greater degree than is generally understood.

The first point for the shareholder in a building and loan association anywhere to grasp is that he is not merely a depositor. Under the law, confirmed by judicial decisions, a building and loan association is to all intents and purposes a partnership. Now this implies a very definite responsibility. In a bank, owned by stockholders and making profits from the funds of depositors, the contributor to a saving fund cannot possibly lose more than he puts in. The building and loan shareholder, however, is in the same position as the bank stockholder in event of losses. The officers are his servants, in the eyes of the law. He is responsible for their acts.

If the building and loan officers bring the association into insolvency through dishonesty—the only method possible and the one used in the Philadelphia case—each owner of a share of stock in that association may be sued for recovery exactly as any partner in a business enterprise may be held responsible for the firm's debts. As evidence of this, hundreds of creditors have taken preliminary steps against each of the seventeen associations in Philadelphia, and each suit against an association involves every one of its shareholders.

But at this point a curious situation has developed. Instead of permitting the law to take its natural course, various large creditors and others have stepped in with a plan to "rehabilitate" the seventeen associations by merging all their assets into one. Albert M. Greenfield, one of the largest real estate operators in Philadelphia, who makes no secret of the fact that his office controls more than twenty other building and loan associations, has been named trustee for the seventeen insolvent associations. He is now, with the assistance of another court, trying to get the approval of all creditors to his rehabilitation plan. If some of the creditors hold out for their legal rights it is plain that the plan cannot be put into effect. And some of them are holding out.

The natural question of the outsider after learning this much is: "Why should the big creditors want to rehabilitate these associations?" Two answers may be given. One is that these creditors are anxious to protect the shareholders and to preserve the good name of the building and loan system. The other is that the associations are insolvent, and the big creditors are in so deep that they cannot possibly hope to get thier money back by straight legal action. Naturally, the creditors are using the first answer for all it is worth. They are quite willing to be put in the position of public benefactors.

The fact is, however, that most of the seventeen wrecked associations were deliberately organized for speculative and more sinister purposes of the men now in jail. At the trial it was brought out that the total number of shareholders in all of these associations does not exceed 1,500, and according to state bank examiners and other expert witnesses, and the admissions of the criminals, not more than fifteen per cent of these shareholders were bona fide. In other words, the great bulk of the names carried on the lists of members was made up of "straw men" for the various speculators involved. Others had a good idea of what was going on. They were in the game for what they could get out of it.

All the creditors are well aware that

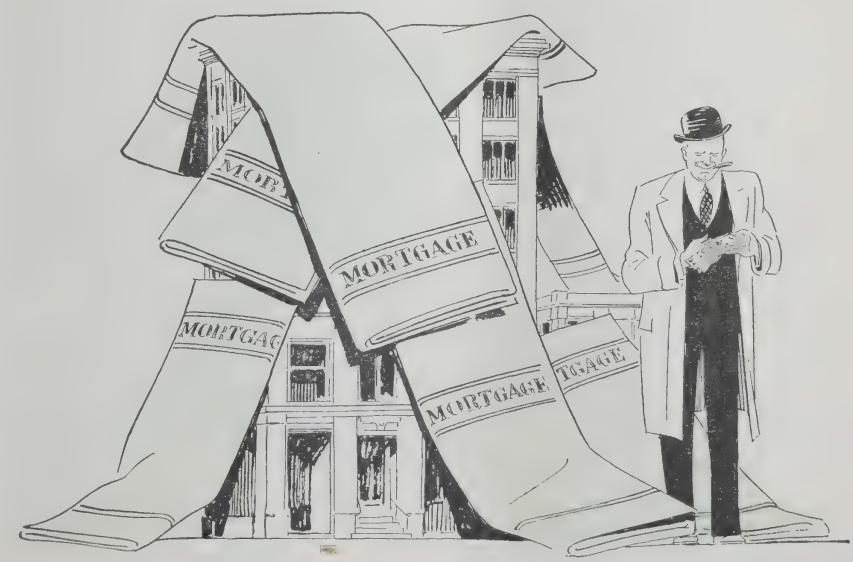
The syndicate system brought in money evils, first, by compelling the wage earner to compete with big capital.

legal action against men of this type would be a waste of time and money. Therefore in the event suits are brought the claimants must depend for collection on the few hundred honest shareholders who had put all their savings into one of the seventeen associations. Since most of these honest victims also obtained mortgages to help them buy homes, and since the speculators saw to it that the prices of these homes were amply inflated, the average equity subject to recovery at law is so small as to be negligible.

It is quite evident therefore that the only hope of the big creditors is to bring about a rehabilitation, and to take their payments in installments over a long period of years, as they can get them. If this can be done it will mean that the new association so formed will be placed on a parity with others which always have been honestly managed. It will start with a tremendous load of debt—the total losses ran well up to a million dollars. How many wage earners would care to join such an association, no matter what assurance might be given that their interests would be protected?

An understanding of this plan makes it fairly clear why creditors are not anxious to talk about the cause and effect of the building and loan smash. But the situation becomes even clearer when the collapse is traced back to its beginning—the other point about which nothing is being said. As everyone knows, the building and loan system is the poor man's method of getting credit to aid him in building or buying a home. Mutual and coöperative in every sense of these words, it was always intended only to make individual loans and not to speculate.

The foundation of the swindles perpetrated in Philadelphia was laid back in the war boom days when someone discovered that there is nothing in the Pennsylvania law—or in that of most other states—to prevent syndicate loans. Up to that time there had never been a shortage of building and loan funds. Any workman who could get together as little as $50 could buy a small home by joining a building and loan association. He obtained from this organization a second mortage on which he paid twelve per cent a year, half of this being applied to principal and half taking care of interest.



The syndicate system brought in many evils. First, by compelling the wage earner to compete with big capital, it made possible extortionate commission charges by real estate men who came into control of the associations. Then it encouraged speculation in high-priced central realty, and it made possible an orgy of inflation. Big real estate speculators began some years ago to reach out for control of the building and loan associations. Since the shareholders rarely did more than pay their monthly dues, this was easy in some cases. A speculator had only to buy stock in an association, get himself or a straw man elected as secretary, and the wedge was in place. Of course, there were many strong, substantial associations that could not be taken over. So the speculators started new ones.

In 1922 the State Banking Department of Pennsylvania took cognizance of the dangers of this system and began to issue warnings. Since then at frequent intervals the Department has tightened up on its regulations and has issued statements designed to prevent exactly what happened this year. At the last session of the legislature the Department had introduced a series of bills which would have made the crash impossible, or at least would have minimized the losses. But these measures were killed by the speculators and money lenders' lobbies which were making fat profits out of syndicate loans.

The scandal in the misuse of building and loan associations has been an open secret in Philadelphia since that time. Repeatedly the newspapers have published records of specific cases in which speculators bought a property and then loaded it up so heavily with mortgages divided among many associations that the buyers actually paid themselves cash in taking title. The scramble got so wild that one speculator advertised that he controlled twenty-nine associations. This was too much for the others. They soon induced him to quit advertising the fact because of the effect it might have on shareholders.

That was the easy money field which attracted the sinister genius of Alexander A. Roseman. He got into it first in 1922, but the records indicate that he was too greedy then and in too much of a hurry. On May 19, 1922, he was arrested on a warrant sworn out by the State Banking Department charging him with the embezzlement of $53,900 from the Philadelphia Investors' Building and Loan Association. He was held in $25,000 bail for court. But when the day of trial arrived Roseman had made restitution, and the association officials dropped the prosecution.

But Roseman was not cured. In spite of his arrest, he had determined to get some of the money that was obtainable by trading on the nation-wide reputation of the building and loan system for financial integrity. This time, however, he tried to save his own skin by operating (*Concluded on page 27*)

Loaded up with mortgages, divided among associations, the buyers actually paid themselves cash in taking title.

# At Later Conventions With Bryan

## As a Correspondent or as a Convention Orator the Commoner Was Equally at Home

PART III.

By JAMES SCHERMERHORN

APART from his literary skill, the name of William Jennings Bryan at the head of a convention story had come to have no mean value in newspaper offices. As a correspondent he sat in the Republican convention in Chicago in 1912, and witnessed the split over Roosevelt.

This middle-aged man who had polled upward of 20,000,000 votes himself in three campaigns came and went like any special correspondent. He never dressed for his part in the quadrennial spectacle. In fact, his shiny alpaca suit and his untrimmed locks were not far from unkempt. He always wore a cap, which he thrust in his side pocket as he reached his seat —to save the checking fee, according to the wits who sat about him.

James Kirby Risk, of Indiana, faithful through three campaigns, joined Mr. Bryan and myself as we walked over to the Chicago Athletic Club on Michigan avenue, to talk over the developments of the tense week beginning with Roosevelt's Sunday night pronouncement in the auditorium: "We stand at Armageddon and we battle for the Lord." It was Friday afternoon. The hope of a compromise on Hadley, of Missouri, the suave and conciliatory temporary chairman, had faded. All in our little group foresaw the impending disastrous Republican ruction. The special correspondent did not say it, but he could scarcely have repressed the wish that the Grand Old Party had taken it upon itself to split on the rock of factionalism four, twelve or sixteen years before.

Baltimore a few days later, and behold! the Bryan who sent in the story of the split at Chicago is tremendously active in shaping the story that is to be written here.

First he is on the platform in the old effective form, employing the familiar modes of manual emphasis—the clasped hands, the outstretched hands, the outstretched arms—urging the adoption of a resolution that will disqualify any candidate "who is a representative of or under any obligation to Morgan, Ryan, Belmont or any other member of the privilege-hunting, favor-seeking class." The resolution adopted, he sends the second thunderbolt reverberating through the convention when he announces that Nebraska will not participate in the nomination of any man whose nomination depends upon the vote of the New York delegation, but that it withdraws its support from Clark and casts its ninety votes for Nebraska's second choice, Governor Wilson.

That Bryan rose above all personal or selfish considerations in this dramatic action, which made Woodrow Wilson the nominee, is palpable to anyone who recalls that Wilson in 1907 wrote the Joline letter, in which he prayed that "we could do something, at once dignified and effective, to knock Mr. Bryan once for all into a cocked hat."

Mr. Bryan was not thinking of grudges or of getting even at Baltimore, but of "letting the people rule."

I went back to the hotel with him after this signal achievement, which had caused the banners of a majority of the states to press in joyous accord toward the platform where he stood, and others to be flaunted in his face in insolence.

"It has been a great day," he said —the day of his last convention victory —"but Democratic sentiment back home brought it about. Tens of thousands of telegrams poured in on the delegates. I heard from 3,300 persons in this way myself. I was merely instrumental in letting that public opinion bring its coercive power to bear upon the convention.

"I never advocated a man except with gladness, and I have never opposed a man except in sadness. If I have any enemies in this country those who are my enemies have a monopoly of hatred. There is not a single human being for whom I feel ill will; nor is there one American citizen in my own party, or in any other party, whom I would oppose for anything unless I believed that in not opposing him I would surrender the interests of my country, which I hold above any person."

Woodrow Wilson and William Jennings Bryan on their way to a Cabinet meeting.

They wanted to hear Mr. Bryan, then Secretary of State, at the convention of the Associated Advertising Clubs of the World in Baltimore in 1913. The organization, which had adopted "Truth" as its motto, was holding its sessions in the auditorium where Mr. Bryan said to the Democratic delegates one year before:

> "The trouble with so many men is they do not believe in resurrection. They do not seem to know that Truth cannot die; that no grave can confine it."

They thought it would be most fitting to have the Commoner come back and speak of integrity in the printed word and in every transaction of business life.

I volunteered to take the invitation to the Secretary of State in Washington, and did so. But he was absorbed in the project nearest his heart, namely, world peace by postponement, and was obliged to decline.

With unfeigned satisfaction he showed me the pen with which treaties with foreign nations had been signed.

From steel composed of melted swords, Secretary Bryan had nickleplated paper weights made in the form of plowshares, bearing the inscription: "They shall beat their swords into plowshares." These paper weights he was accustomed to present as symbolic souvenirs.

The Democracy sought to make a

third successive triumphal entry into power by way of the Golden Gate. Mr. Bryan, according to custom, first attended as a special writer for the press the Republican convention with its Saturday night culmination in the selection of the thoroughly groomed Harding.

He was now sixty. Perceptibly older, grayer, more furrowed, he still showed the alertness and versatility of the younger pressmen, throughout the week of clashing candidacies at Chicago.

The orators of the convention were older men than he. Nothing in the deliverances of Lodge, Depew or Cannon could have given him any concern over the retention of his laurels as the leading political spokesman of his time. Journalist and author—a dozen at least of his works having come from the press—what a prideful achievement to have the afternoon of life made glorious and fruitful by supremacy, also, in the realm of the spoken word!

Twenty-four years after their divergence on the silver issue, the oratorical gladiators, Bryan and Bourke Cochran, clashed again on the liquor question at San Francisco. It was the outstanding incident of the convention, Bryan battling magnificently for the moralities; the deep-voiced Cochran bringing his Celtic fervor into play in advocacy of liberty and expediency.

I had sent a young reporter, two years out of the university, winner of oratorical honors himself, to report the San Francisco proceedings. The young man wrote:

"He faced a great opponent when Bourke Cochran made his plea for 'that morality that comes from men's hearts.' But Bryan retaliated with 'If you do not want enough alcohol in your beer to make you drunk, what do you want any alcohol in your beer at all for?'

"It was a stirring scene, a battle of oratorical giants. Neither won the vote of the convention, the soft Southern shafts of Carter Glass and the brilliant rapier-like thrusts of Bainbridge Colby kept the delegates away from Cochran's beer and Bryan's bone-dry prohibition.

"Above the speaker's stand, at his right was the Marine Band, and at the left a great pipe organ. Senator Robinson, of Arkansas, directed the activity of these two instruments of noisy celebration. Whenever a demonstration lagged, Senator Robinson waved either right or left hand, and organ or band started up 'Dixie,' 'East Side, West Side' or some other song of inspiration.

"But when Bryan finished his tremendous appeal and stood, arms outstretched to the convention—waiting its approval or dissent—there was a moment's hush. In that moment

Bryan was frequently used as a subject in cartoons. When he saw this one, he summoned his wife and son to glance at it, and then wrote for the original drawing. His death occurred before the picture was delivered.

Senator Robinson wheeled and held both hands up to the music gallery, checking any demonstration. Then the crowd rose to its feet. It seemed as if the impulse to cheer had struck 12,000 persons at the same instant, so tremendous was the first outburst. It rose and gained in power. The Bryan enthusiasts tore the state standards from their sockets and laid them across the feet of the Commoner. Nebraska was first—Bryan's own state. Others followed. There was a terrible battle in the solid ranks of the New York delegation—they remembered Baltimore—but a Bryan warrior bore the standard to the platform.

"Bryan stood there, choked with his emotion and his never abandoned hope. For forty-three minutes, that crowd, unaided by band or organ, paid its shouting, tearful tribute. Three or four times Senator Robinson tried to check the applause with his gavel. It was a little less than three-quarters of an hour when this was accomplished.

"Then a new figure appeared on the platform. Not the magnetic Bryan, in loose alpaca coat and challenging voice, but the immaculate Colby in satirical vein.

"'I could speak more loudly,' he began, referring to the thundering climax of Bryan's speech 'but I find a man thinks better when he speaks more quietly.'

"It was all over quickly. Glass followed Colby. The passion of Bryan's appeal dwindled under the rapier and the sword. Cochran had served his purpose and sat back smiling. The convention ratified the weasel-worded resolutions in the platform—without change—the crowd filed from the auditorium, thrilled still by the spectacle of Bryan—winning, then so quickly losing."

"My heart is in the grave," said the Commoner to those who had words of comfort for him, as he quit the scene, undone. Did he think of Russell, the rejected, in 1896, or Clark the uncrowned in 1912?

Early June, 1924, found him in Cleveland, following from his seat in the press section the all but frictionless unfolding of the Coolidge plan of action and the strategy that turned the LaFollette defection into Democratic despair. His specials to the newspaper reflected the high regard he felt toward the President's personal integrity and good purposes.

From Cleveland he came to Detroit and Lake Orion. I joined him at his hotel Saturday afternoon. Then when the reporters and cameramen had gone, he read to me the hearty letter of congratulations he had penned to Charles G. Dawes on his nomination to the Vice-Presidency. He recalled when they were poor and struggling lawyers together in Lincoln, Nebraska; how their friendship and mutual good will had continued through all the years, despite political disagreement. He closed by wishing him "everything but votes."

The foremost Democrat publicly announcing admiration for the opposition ticket!

He rang for a stenographer to take the syndicated Sunday school lesson study that was to go out to the newspaper clients that night—a feature growing out of his immense Bible class at Miami, Florida, which to many was a memorable part of their winter experiences in the Southland.

Bryan bore a new state standard to the twenty-second national convention of the Democracy. The commanding figure had always (Concluded on page 21)

# Whistling Wings

## Being the Life Story of Bronzehead and His Feathered Brood

By JAMES CLYDE GILBERT

The first day of the fall migration Bronzehead led his flock safely across Lake Superior and the Straits of Mackinac.

MOTHER Redhead duck had chosen as her nesting place a hummock of rank vegetation on a small islet near the mouth of a spring creek. This creek emptied into the north end of Grass Lake. Another larger stream drained Grass Lake south into Lake Superior. Mother Redhead had chosen the site well. Entrance to the water was by means of a narrow tunnel, shrouded in grass and dense growths of bullrushes. The Redheads are poor walkers, and she chose to glide off her large nestful of buff eggs directly into her natural element. Daddy Redhead, with his coppery, reddish head glistening in the sunlight, kept at a distance paddling about, ever on guard to see that no harm befell his little home in the rushes.

Eventually, ten of the eleven buff eggs cracked under the pressure of growing bodies, and ten fluffy little balls of duck came silently creeping out. For ten hours they nestled close under the mother's wings, uttering not a sound that might betray their presence to wandering minks, fisher cats or the like. Most of them came into the world on a cold, misty day when great billows of fog swept across the marshland. By the time the fog had disappeared the ten were ready for the water. Mother duck cautiously preceded them to the water's edge, silently slipped in and convoyed them out into the shallow channels. They took to the water with glee, dipping their tiny heads and spinning about in the back currents.

Days passed and all was peace and harmony in the swamp lands. Well concealed in the waving sedges that literally dropped food into their gaping mouths, the Redheads fed silently upon the ripe grain and seeds, dabbling on the surface of the water, or suddenly tipping tail upward and stretching their little heads downward in the shallows.

In this manner they probed the muddy bottom for mollusks, fish, worms, rootlets, and various forms of vegetable matter dear to the heart of the duck. One exceptionally large drake in the little flock was the acknowledged leader. We shall call him Bronzehead. He was constantly exploring new waterways, secret streams and tiny bayous in the acre or so about his home. Later on, in the absence of the mother, he led the little flock about the marsh to the various feeding grounds. Always keen to scent danger, he steered clear of ambushes and kept a weather eye open for hawks, owls and other enemies.

The season advanced. The days grew shorter. The ten ducklings had been reduced to seven, three having met death in various ways. Number one was snatched from the flock in a flurry of spattering water and brandishing wings, by a fox who had lain in wait on a hummock close by a narrow channel through which the luckless duck had paddled. Number two fell a prey to a slinking mink who sank his teeth in the bird's neck one night as the flock lay sheltered in the lee of an island. The third suffered a terrible death in full view of his brothers and sisters.

One evening they soared to a little pond east of Grass Lake, and were peacefully feeding on wild rice, when a dark shadow passed under the flock, pausing beneath the center of the group. Suddenly, with a loud quack of terror, one of the ducklings was seen to flutter helplessly on the surface. Gradually it was drawn down beneath the water and drowned. The dark shadow passed on, dragging the body of the duck with it. It was a huge snapping turtle that had taken this means of obtaining a dinner. The helpless duck is held by the foot under water until it dies. It is then eaten at leisure.

But all was not tragedy. There was one icy spring that came welling out of the dense swamp, rippling over stones and logs like music. One bower in particular appealed to the ducks. It was at the edge of the lake just where the creek spilled in from a spring a few feet beyond. The water glided over a miniature fall with a silvery murmur that was pleasing to the ears of the wild creatures on a sultry day. The members of the flotilla would congregate about this spring, diving and refreshing themselves in its icy waters beneath the overhanging cedars.

Autumn came in a burst of glory. Frost whitened the landscape and turned the leaves of the deciduous trees all the colors of the spectrum. A snappy wind from the northwest sent the ducks foraging. They wanted to be in good condition for the flight south. One morning there was a film of ice on the pond in which the flock rested. The chill of autumn crept down on the swamp-land lakes. Other flocks swept southward with whistling wings. By this time the young had learned all the tricks of flying, and took to the air with a joyous cry. Over swamps, hills and timbered valleys they swept southward. To the east the glistening waters of Long Lake lay like a silvery ribbon fifty miles in length. Other flocks arose from the waters of Trout Lake, Owl Lake and Wintering Lake. The sky was filled with the quacking of a myriad host.

In the dense swamps of Mississippi and Louisiana the Redheads passed the winter with other wild fowl.

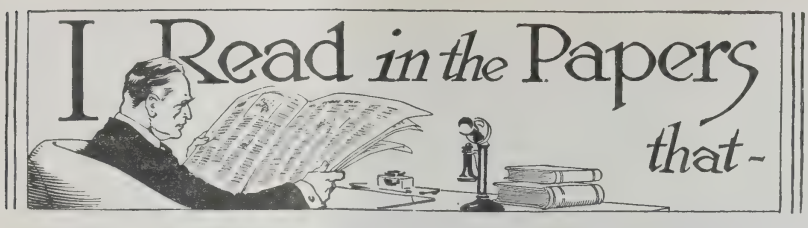
The first day they crossed Lake Superior and the Straits of Mackinac, finding a resting place in a quiet nook on Mullet Lake in the northern part of the Lower Peninsula of Michigan. In the early morning they took flight again and landed in Saginaw Bay where the awaiting hunters gave them a rousing welcome from a battery in a blind. Two of the flock fell. The remaining seven, consisting of five young ducks and the two parents, joined another group and continued on their way. They were gaining in strength. With necks outstretched, wings beating rapidly, they sailed over Southern Michigan, Northern Ohio and dropped in a quiet bay in a little lake in Northern Pennsylvania. An early morning hunter got two of the group before they sped south next morning. One of the two was Bronzehead's father.

Bronzehead now took the lead because of his strength. Another drake from the flock, picked up in Saginaw Bay, made the turn east toward Maryland, and Bronzehead followed as it was new territory to him. He soon forged ahead again and that night the entire group dropped into the silvery waters of Chesapeake Bay. This was a new experience for the young ducks. They soon learned to hunt their food in the salt water and in the wild celery marshes along shore. Certain members of the flock insisted on flying inshore to feed, and Bronzehead, from the deeper water offshore, could hear the dull boom of shotguns and see the remnants of the flock whistling past for other fields. Bronzehead and six others fed in what appeared to be open water, but suddenly two gunners arose from sinkboxes placed in a bunch of wild celery and opened fire. One of the gunners was using BB shot, and two of these struck Bronzehead, but did not seriously injure him. Four of his companions failed to follow. It was a great day for hunters on the Chesapeake. One of the four birds killed was a sister to Bronzehead.

Bronzehead, together with the remnants of his own and the Saginaw Bay flock, joined the Canvasbacks, the Scaups, the Golden Eyes, the Buffleheads and other sea ducks and sped southward. In the great swamps of Mississippi and Louisiana they spent the winter. Here, among the alligator hunters of the 'Cajun country the Redheads spent a glorious winter. Spanish moss festooned from cypress trees overhung the misty bayous. The bellow of the bull alligator and the squawking of the herons was music to Bronzehead and his kind. Egrets and other native birds were their companions, and there was food for all.

In early spring the Redheads became restless. Bronzehead had grown to a full-sized drake. His well-rounded head and throat were a bright reddish bronze. The lower neck, lower back, and fore parts of his body above and below were black, and the rest of the back, sides, and shoulders were waved with black and white lines of equal width, giving the parts a silvery gray aspect. With wings a brownish gray, minutely dotted with white, he was a beauty. His mate, for by this time he had made a selection, was of a more sober hue. Her upper parts were a dull grayish brown, the feathers edged with buff, or of an ashy tint, which gave them a mottled appearance. Her forehead was wholly brown with a reddish line behind the eyes and cheeks. The rest of her body was a grayish buff.

As the sun rose higher with the coming of spring the ducks grew restless. There was much quacking and flying about, and one sunny morning they took flight north. Now they had nothing to fear from gunners, for the Federal Migratory Bird Law was one statue that was vigorously enforced. Without the sound of a gunshot in their direction they winged their way north by easy stages.



In the quiet waters of an estuary of Lake Nipigon in Ontario, Bronzehead and his mate raised a family of twelve and returned with them to the Louisiana swamps for the winter. On the way south they followed the same general course of the previous year, but Bronzehead, grown wary of shore lines and blinds, fed farther out and brought his family safely through. His flock scattered in the South and mated for the northern flight. He and his mate remained at White Lake in Southern Louisiana.

The winter passed uneventfully, and spring found Bronzehead leading a flock of Redheads north along the Atlantic coast line. They made their way leisurely, feeding on the rice beds of the Georgia savannahs and marshes and hugging the coast to North Carolina. Between Cape May and Montauk Point, Bronzehead brought his flock down to feed. As it was the spring migration he had little to fear from the gunners, and they fed comparatively close to shore. Bronzehead noticed that the wavelets were not breaking into whitecaps as they should in the breeze that was blowing inshore, and there was a peculiar odor that told him all was not well. A shimmering, black substance gummed his feet and prevented his diving with his usual celerity.

Far offshore a few rum-runners and tramp steamers were smoking their way to the Bahamas, South America and the Orient. The ducks were tired and for some time they swam about, but with a certain undefined fear that all was not as it should be. A black, oily substance gummed their bills and nauseated them. But it was a resting place if nothing more and they remained, coating themselves with the oil. With a roaring exhaust a revenue cutter rushed out from behind an island and steamed toward an incoming boat from rum row. They passed close to the ducks, frightening them. They sought to rise, but only two of the eighteen in the flock were able to clear *(Concluded on page 27)*

They sought to rise but felt themselves pulled down as by an invisible weight. Greasy, black oil penetrated their feathers and burdened their wings. The hot sun beat down. By nightfall all were dead.

the standing joke about the Swiss Navy will no longer exist, so far as a mercantile marine is concerned, after July. A number of composite steamers designed not only to navigate the Rhine but also to venture across the North Sea to English ports will be put into service at Basle, eight hundred miles from the seaboard. The present Swiss navigation is limited to river fleets that ply between Basle and Rotterdam.

The International Inland Navigation and Hydraulic Power Exhibition will be held in Basle at the same time the new river-ocean steamship service is inaugurated.

---

two hundred elk were shipped from the Flathead Indian reservation near Missoula, Montana, to Middleboro, Massachusetts, where the National Elk Grazing and Breeding Association has provided a new home for the animals. They made the trip in ten electric-lighted express cars at a cost of eighty thousand dollars, which included the round-up and loading as well. It is planned to transfer four hundred more of this elk herd to Middleboro, and needless to say those in charge of the undertaking hope that the expense may be pared down through experience.

---

at the instance of Senator George W. Norris, the Senate has passed for submission to the various states for their ratification a proposed amendment to the Federal Constitution that would require the President to be sworn into office upon the third Monday in January instead of March 4. If it is adopted it will automatically end the "short session" of Congress composed of many members who have been defeated at the November elections meeting in December and legislating until their successors take office in March. The efforts of these defeated but still legislating Congressmen are largely devoted to job hunting and many of them are entirely willing to give their vote, just repudiated by their home constituency, to support any political group or the President, either outgoing or incoming, that will land them in a "lame duck" job. The original intent of the long interval between Presidential elections and the assumption of the office was to permit Congressmen from remote states to arrange their affairs and make their way to Washington by stagecoach.

---

the so-called airline highway between St. Louis and Kansas City has just been opened to traffic. This 261-mile road, 20 miles shorter than any railway between those cities, is the first paved highway across any trans-Mississippi state. The improvement will be hailed with delight by motorists all over the nation who have the most vivid and distressing memories of the mudholes of the dirt sections of transcontinental motor routes west of the Mississippi River. It is greatly to Missouri's credit that she has performed this great public work although she is not so rich a state as a nearby commonwealth that still lags in paved road building.

Albert Parker Fitch, a growing college power in this country, told a group of "Youth Movement" youngsters:

*"You are lovable, but irresponsible and superficial, and, despite all your radical statements, inherently conservative. Your minds are undisciplined and dissipated. You have impressions of ideas, but not ideas.* A little less intellectual conscience and a little more moral conscience wouldn't hurt."

---

The *Living Age* gives a very interesting side light on Briand's ideas:

"He said to me only the other day, after coming back from Locarno: 'Our Nationalists are funny people. They start out by declaring that Germany is a horrible country with twenty-four million more inhabitants than we have, who cherish an indestructible love of militarism, and possess industrial plants that enable them to equip themselves for war overnight. But what consequences do these Nationalists draw from all this? That we must irritate that dangerous country in every possible way and neglect no opportunity to make it hate us. But even that is not enough. The second article in their creed is that we should be on the worst possible terms with England, that we should shout and write on every occasion that she is trying to ruin us. And as to the Italians, we must make it clear to them that we do not take them seriously, that we shall treat them as the "mandolin-players" that we claim they are. And, to put a finishing touch on this magnificent policy, it is imperative, last of all, that we have no relations whatsoever with Russia, and that we abuse the Americans for greedy pork-packers because they have the impudence to demand back the money they loaned us. You may say that I am exaggerating and that such a political programme could emanate only from an insane asylum. But just watch those people, my friend. Listen to them, read their newspapers and their books, and you will see that I am not exaggerating. In fact, I am not putting it strong enough."

## Our pages now closed to advertisers

A DIFFERENCE of opinion has always marked THE DEARBORN INDEPENDENT'S attitude toward taking advertisements. This is true both of our readers and our management. Many readers have prized the Magazine because it was free of advertisements, and regretted to see it depart, even temporarily, from what they thought was a fixed policy. The highest authority in our management also has shared this view, from the very beginning. Latterly, however, other opinions took precedence for a time. The taking of advertisements had begun and was proceeding with very satisfactory success, when it was finally ruled that the character of THE DEARBORN INDEPENDENT did not comport with the practice of accepting advertisements, high as we naturally esteem that form of publicity.

It therefore becomes our duty to announce that the pages of THE DEARBORN INDEPENDENT are closed to advertisers. We appreciate the ready patronage of some of the best business institutions in the United States, among whom we may mention:

Valentine & Co., New York City
Berry Bros., Detroit
U. S. Light & Heat Corporation, Niagara Falls, N.Y.
Canal Bank & Trust Co.,New Orleans, La.
Kalamazoo Stove Co., Kalamazoo, Mich.
Reversible Collar Co., Boston
Timken Roller Bearing Co., Canton, Ohio
Firestone Tire & Rubber Co., Akron, Ohio
Kaffee-Hag Corp., Cleveland
Stewart-Warner Speedometer Corp., Chicago
John C. Moore Corp., Rochester, N.Y.
Goodyear Tire & Rubber Co., Akron, Ohio
Victor J. Evans Co., Washington, D. C.
G. H. Bass & Co., Wilton, Maine
The Hanover Inn, Hanover, N. H.
The Bassick Mfg. Co., Chicago
Great Northern Railway
Texas Pacific Railway
LaSalle Extension University, Chicago
Kimley Electric Co., Buffalo
The Glidden Co., Cleveland
F. F. Ingram, Detroit
Fyre-Fighter, Dayton
Clarence A. O'Brien, Washington, D. C.
Henderson Bros., Boston
Baker & Kimball, Boston
Shipman-Ward Co., Chicago
Dramatic Publishing Co., Chicago
Bastian Bros., Rochester, N. Y.
Oliver Plow Co., South Bend, Ind.
Stark Music Co., St. Louis
Illinois Central R.R.
International Correspondence Schools, Scranton, Pa.
Hunting & Fishing Magazine, Boston
Superior Metal Products Co., Elyria, Ohio
Humble Oil & Refining Co., Houston, Texas
Faraway Radio Co., Cincinnati
Hol-Set Mfg. Corp., Rochester, N. Y.
Concord Worsted Mills, W. Concord, N. H.
Chas. H. Ingersoll Pen Co., Newark, N. J.
American School, Chicago

# Chats with Office Callers

"But the object of writing to you," ***says a Colorado Correspondent,*** "was to get an idea out of my system to Mr. Ford and Mr. Edison, if in your opinion it is worth consideration—(simply this) that all money coined by our Government contain an alloy sufficient to attract a magnetic needle. Coin and bullion will be transported across continent, as has been, for a long time to come. Case of heavy loss by robbery, if buried could be located. Further explanation will come to you of your own thinking."

---

***The Lawyer from the West*** dropped into The Office, and the talk turned on sanity: who showed most intellectual energy, the sane or the insane? "The worst licking I ever took in a lawsuit was given me by a crazy lawyer," said this legal light. "It was a will case, and the attorney for the other side was crazy as a loon. I had a case which was absolutely right in every particular. You could try it every week for the next ten thousand years, and my side would win every time; but this time a crazy lawyer broke it up through sheer brilliancy of attack. No one knows how he did it. But he did. I have had a great respect for crazy people ever since. Had the jury been crazy, or the judge, we might have got a retrial; but the fact that a mere attorney was crazy, made no difference whatever. The verdict, which he won, stood."

---

"I have a list of sixty-one plays," said ***The Man from New York,*** "every one of which is sheer propaganda. I mean by that, the plays were put on the stage to influence the American people to think in a certain way about a certain religion or a certain race. And some of these plays have been surprising popular successes. They are extremely well done, and they get their idea across without the audience suspecting. Of course, that is the supreme excellence of propaganda that its cost is paid by the people to whom you are feeding it. I suppose the chief reason these plays go so big just now is that they are all clean plays; they deal with human emotion and sentiments of righteousness. They take the Anglo-Saxon Christian standard and exhibit it as the standard of other people who daily repudiate it. But decent theater audiences recognize the standard as their own, and receive it with warmth—taking along with it, of course, the racial or religious character that happens to be theatrically attached to it.

"I suppose that I would be denounced for calling attention to this, if it were known that I did. Why? A fact is a fact, and no one should object to it. This five dozen of propaganda plays is a fact, yet to call attention to the fact would bring extremely unpleasant consequences. After all, any race or religion has the right to do this if it wants to. What I contend is that the people who are being fed this propaganda ought to recognize that it is propaganda. I admit the right of the people behind the plays to use the plays for propaganda if they can. But I contend for the right of the people in the chairs to know that it is propaganda they are paying for.

"It seems to be a part of the legitimate work of the Drama Leagues and Play Clubs and Theatergoers Societies to include this as part of *the technique of viewing a play.* One really cannot blame the people behind the plays, one blames the stupid blindness of the people who attend the plays. Every play-goer, whether the play be on the stage or the screen, should add to his tests of its quality and worth, this inquiry: *What is its purpose? What idea is it trying to insinuate? What group would be principally interested in planting the idea of this play in the American mind?* I say that this is a legitimate part of the work of viewing and judging a play. And I want the American theatergoing people to become such judges!

"What they will find, of course, is that many times they are paying $2.50 to $6 a seat to support 'wet', racial, religious, or anti-immigration-law propaganda."

---

"I don't believe in pacifism; I believe in friendship," said ***The Man from Washington,*** as he looked out on fields of Michigan snow—"a statement which may not be startling, and perhaps not appear important, were it not that *the friends of pacifism seem to be the enemies of friendship.* I have been interested for a number of years in promoting friendly contacts between people of various nations and races, and have had the satisfaction of seeing some excellent results of a very tangible kind. As a rule, efforts toward friendship are not misunderstood; friendliness is something the whole world can understand; but of late there has been a strong current of enmity against international friendship, and it comes from one quarter only. If you imagine that therefore we can afford to ignore it, you are mistaken, for the fact is it is most effective. *Pacifism has not peace for its objective, but the disarmament of enemy nations.* Pacifism is waged most strongly among and against the English-speaking nations today. That in itself were a fact sufficient to compel attention in normal times, but the times are not normal. The disarmament of the English-speaking nations is desired by enemy nations. The weapon toward that is pacifism. Another very strong weapon being waged is the weapon of separation. There was once much said about friendship between Great Britain and the United States. Today there is more said about the dislike which is being fomented in Britain against the United States."

---

"I think the tide has turned," said ***The Observer from the West*** as he talked in The Office. "I think the youngsters of today are coming back to normal. That seems to be the opinion of all the people I have consulted lately, including a number of college and university heads. The fever is past. The common sense which must save them, if they are saved at all, has asserted itself. Some of us always thought it would; some of us doubted it. Take it in my own case: I talked to my boys until they began to dislike me and I them. I tried to show them the futility of all the alien tendencies which they were following. I tried to show them the greater ideals and traditions of their own literature and music, than of the half-baked, loose charlatans of today. Nothing doing! I was the 'old fogy,' and I easily became a victim of the delusion that this was the last generation, that the youngsters were destined to overthrow all that the race had secured to them. Then I quit talking. I let the next generation meet its own fate in its own way and with its own sins upon its head. After a period of silence I noticed that the boys were coming around to the old standards—quietly. They were showing themselves born sons of America. They were suddenly not sheiks at all, not Menckenites, nor Dellites, nor Cabellites; they no longer sat in the seat of the scorner, which is a fairly certain indication that they were no longer walking in the way of sinners. Why it happened I can't say. It came upon them as spring comes. Maybe my silence had something to do with it—it may have let the common sense of my sayings get separated from the irritableness caused by my saying them. Anyway, things are so much better now that one has a great hope in youth and a great confidence in the faith that blood will tell. I have half a faith that it is blood that is at the bottom of it. A fig does not bear thistles. The American Christian tradition was not preparing to fruit in a generation that should prove poisonous to itself and to us. Hardly. When we remember that our boys and girls spring from the same stock that we spring from, and that it is in the fiber and sap of that stock to recall its principles and act on them, we may feel entirely safe about the future. Blood tells! Racial fiber is indestructible! Our youth have both."

---

"Yes," said ***The Man from the Coast,*** as he talked over matters in The Office, "we have felt the competition of Florida a little, but not enough to pull us below normal. Where Florida has made itself felt as a competitor is not in the business or settler class, but in the tourists who can go here or there for a few months. By prodigious advertising Florida drew them in her direction last year, but from all accounts her inexperienced handling of them did not tend to hold them. But we of the coast do not feel that we have lost anything permanently to Florida. No doubt that state will develop marvelously. It is within a day or two of many of the principal cities of the country. But the lure of California and Oregon and Washington will continue to be strongly felt. I came across the country in a train that was almost empty; we had clear sunshine every day until we hit the city limits of Chicago."

# Gilbert White the Seer of Selborne

## He Is to the People of England What Thoreau and Burroughs Are to Americans

By W. TEIGNMOUTH SHORE

DRAWINGS BY L. PERN BIRD

IF FAIRIES linger anywhere in England, and I like to believe that they do, it must surely be in woods such as those that hang upon the steep hillside over the pretty Hampshire village of Selborne. Perhaps they were near to me, the "little people," that bright afternoon in June, as I sat looking down through the trees into the broad valley Who shall say that they were not The mystery of the dense woods; the golden light of sunset shifting and sifting through the leaves and boughs; the multitudinous small sounds that frequent every woodland and the gentle sighing of the summer breeze; distant noises from the village; lowing of cattle afar off; the evening songs of the birds:

"Romantic spot! from whence a prospect lies
Whate'er of landscape charms our feasting eyes,
The pointed spire, the hall, the pasture plain,
The russet fallow, or the golden grain . . .
Till all the fading picture fail the sight."

Sundown was as beautiful as the morning had been. Through the heat my friend and I had walked from a small country railroad station, by dusty roads and lanes, between hedges decked with dog-roses, pinky-white and whitey-pink, the Tudor rose, one of the flowers of the Wars of the Roses, the most lovely of English wild blossoms. After the glare and heat of the daytime it was very pleasant to sit here, lazily, on the grassy hill-top, thinking over what we had seen during the afternoon's ramble in the village and talking about him whose birthplace, place of death and of final rest we had visited.

But for the Reverend Gilbert White, Selborne would be unknown to fame; one of the many lovely villages in England, no more. Fortunately for generations past and to come, this kindly, keen-eyed parson made it his habit to write letters to various of his friends in which he told them a little, too little, of what he was and what he did, and much about what he saw and heard in the woods and fields, about birds, beasts and fishes. Brought together these letters made up *The Natural History of Selborne*, which was first printed in the year 1789, and has been printed again and again. Kin he was to Henry Thoreau in one way, finding in and around his birthplace enough to feed his own mind and ours; though he was not altogether a stay-at-home, riding many a mile on his journeys to and fro.

The sun had shone searchingly as we came into the straggling village street that noontide: thatched cottages, creeper-clad; here and again well-worn stone steps leading up to their doors; twisted chimney stacks; front yards and latticed windows ablaze with old-fashioned flowers; the village green, here called the Plestor; the village inn and a tavern or two; a few small stores; and the big, red-tiled house, named The Wakes, wherein Gilbert White lived for many years and wherein he died—though little remains of the old house save an unchanged room or two, and in the garden the gray sundial, which he set up there in the year 1761.

First we visited the vicarage, where he was born on July 18, 1720, his grandfather then being the village pastor. It is a fine sample of the comfortable English parson-house; he himself describes it as an "old, but roomy and convenient edifice . . . Behind the house is a garden of an irregular shape, but well laid out; whose terrace commands so romantic and picturesque a prospect that the first master in landscape might contemplate it with pleasure." As indeed did we. All so peaceful and sedate; trim; the close-clipped hedges and the well-shorn lawn; the bees murmuring among the flowers; the gentle song of the brook as the foot of the steepish slope that falls down from the grassy terrace; the tall trees blue-gray against the clear sky, over which now and again sailed a massy white cloud. Gilbert White often walked this garden, for though he was never the occupant of the house he was always on terms of close friendship with those who dwelled there.

Then we passed beneath a wondrous old yew tree—planted some six hundred years ago—into the "God's Acre" that surrounds the parish church, in which Gilbert White ministered often, sometimes as curate of Selborne, more often voluntarily. The building is of great age; much spoiled by the hand of the restorer; interesting chiefly as typical of the English parish church; to the student of history and architecture affording little of concern, but filled with charm for the lover of country life. Standing by the ancient stone font, in which Gilbert White baptized many a Selborne babe, we look through the deep-shadowed porch to the green churchyard, where the history of the village is writ in tombstones. We look up at the black-beamed roof, recalling his note about it: "I remember when its beams were hung with garlands in honor of young women of the parish, reputed to have died virgins; and recollect to have seen the clerk's wife cutting, in white paper, the resemblances of gloves, and ribbons to be twisted into knots and roses, to decorate these memorials of chastity."

On a tablet, set somewhat high up on the wall, we read: "In the fifth Grave from this Wall are interred the Remains of the Rev. Gilbert White, M.A., Fifty years Fellow of Oriel College, in Oxford, and Historian of this, his native Parish. He was the eldest Son of John White, Esquire, Barrister-at-Law, and Anne, his wife . . . which said John White was the only son of Gilbert White, formerly Vicar of this Parish. He was Kind and Beneficent to his Relations, Benevolent to the Poor, and deservedly respected by all his Friends and Neighbors . . ." For once in a way here is an epitaph that does not lie! He died on June 26, after a short illness, which was the result of a chill contracted while conducting the funeral service of a parishioner.

Then out again into the churchyard,

Above—Grave of Gilbert White—the headstone on the left of the cross, with the initials "G. W." Below—The Hanger wood on the hill over Selborne. "The green-coated hill."

where close beside the chancel wall is a gray headstone, on which is carved the simple record: "G. W. Died June 26th., 1793." In his will he had ordered that his funeral should be "as plain and private" as possible, and that "six honest day-labouring men, respect being had to such as have bred up large families, may bear me to my grave, to which I appoint the sum of ten shillings each for their trouble . . ." the which request was fulfilled. Many a pompous tombstone stands over unholy and forgotten dust; many a resonant epitaph tells lies about the dead; but here, humble in death as in his life, sleeps one whom the world loves and will not soon forget. He had often expressed his desire to live and die at Selborne, and his wish was granted.

His personality is like the faint scent of lavender in an Old-World house. He was a quite ordinary country clergyman save that he wrote an immortal book; he who looked only for that immortality which he taught was the reward of a blameless life. A friend wrote to him: "Your work . . . will immortalize your place of abode as well as yourself." Seldom had critic spoken so truly.

Unfortunately there is not any painted portrait of him, but we are told that he was no more than five feet three inches in stature, "of a spare form and remarkably upright carriage"; very active; his face alive with kindliness and generosity. He died a bachelor, but he must not be accounted as in any way inclined to be an anchorite. We get many glimpses of his hospitality to relations and friends, by whom he was much loved. A quite humor, as shown by this: some information about the habits of the swallow being given him, he inquired if the farmer from whom it was gained was one likely to know what he was talking about. This curious reply was given: "Why, yes, he is a married man." Gilbert White made comment: "Though I am a very unworthy bachelor, I presume I know swallows as well as most married men."

Often we gain more insight into a man's character from side lights than from a blaze of examination. As thus: of Gilbert White a nephew wrote, "If I were called upon to say in what point he particularly excelled, I think I should say that it was in his mode of addressing his poor neighbors. His kind, philanthropic, and charitable tones and his humane inquiries made them feel that he was their true friend."

He did not disdain good food or to look upon the wine when it was rosy; upon one occasion noting mournfully that the morning's twinges of gout gave him occasion to ask "whether I drank too freely among my friends?" And he was acquainted with other liquors than port wine; in a letter to his niece he says: "Not long since I bottled out some very fine raisin-wine. The next morning before I was up Thomas came and told me that he thought the wine had fermented and broke some of the bottles; for a stream of wine ran from under the vault door. To this I replied like a philosopher, that it was impossible that the fermentation could be come to such a degree in so short a time. Thomas came up again, and told me that the stream smelled also of brandy or rum. This account confirmed my first suspicions. So I got up and went into the cellar: when, woe is me, the shelf was fallen down and—*caetera desunt*."

The keytones of his character were kindness and gentleness. "I was born and bred a gentleman," said he, "and I hope I shall be allowed to die such." He lived and died a gentle man.

We stayed in Selborne that Saturday night, sleeping in an Old-World room of sloping roof and many angles, with rough floor, and with a tiny window that looked out on the village street. Then on the Sunday morning, again we went into the shadowy wood, described by himself as "a long hanging wood called the Hanger. The covert of this eminence is altogether beech, the most lovely of all forest trees, whether we consider its smooth rind or bark, its glossy foliage, or graceful pendulous boughs." We made our way along the edge of this woodland and crossing the highway came to the brow of a grassy knoll. Before us stood up the green-clad hill, dominating, I almost said domineering; before us lay spread the village in its sheltered vale; the red roofs and those that were thatched; and the gray church tower in which the bells were ringing:

"Hark, while below the village bells ring round,
Echo, sweet nymph, returns the soften'd sound;
But if gusts rise, the rushing forests roar,
Like the tide trembling on the pebbly shore."

or, to quote Gilbert White once more:

"Now climb the steep, drop now your eye below
Where round the blooming village orchards grow;
There, like a picture, lies my lovely seat,
A rural, shelter'd, unobserved retreat."

The vicarage and the church tower. "A rural, shelter'd, unobserved retreat."

# At Later Conventions With Bryan

(*Concluded from page 15*)

appeared at the head of the Nebraska delegation. Now the Commoner came as a delegate-at-large from Florida. He had gone there in the hope that the milder climate and the sea would benefit Mrs. Bryan's health, seriously impaired since the World War period.

Setting forth in his automobile, he had made a canvass for a place on the delegation from the state of his adoption. Although he had brought out the name of A. A. Murphree, president of the State University at Gainesville, Florida, as his choice for the Presidential nomination, he accepted a place on the delegation subject to instructions to support McAdoo.

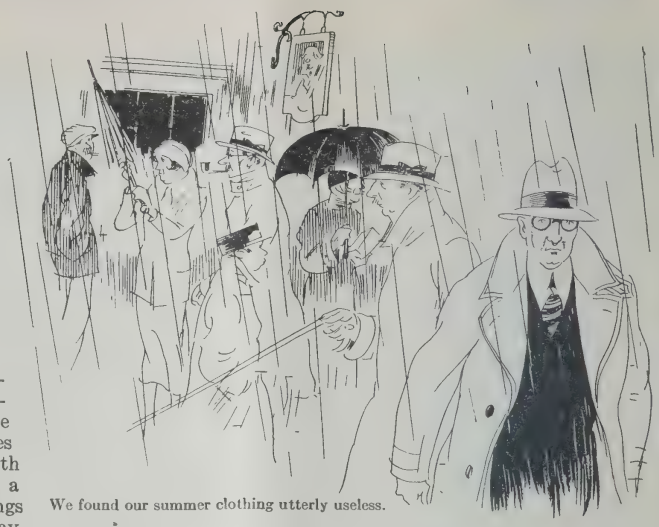
How sharp the contrast between Bryan at Cleveland and Bryan at New York! How striking the difference between the rôle of looker-on and leader; of copy-maker and platform-maker! For Bryan's deepest interest in the proceedings centered in the resolutions. He was against the projection of racial or religious bitterness into the campaign; and he favored a referendum on going into the League of Nations.

That was the last picture I had of the Commoner in action at a convention. Stripped to his shirt, hot, tired, yet serene and composed! I would have given anything to have had a look into his mind right then, and obtained his summing up for his own satisfaction of all the appeals of those feverish, unseemly hours, in which "this will get you the votes, gentlemen of the committee!" was the reiterated clincher of the propagandists.

Bryan emerged a victor from the long, heated sittings of the committee that followed the two days and nights of open sessions. His conception of a platform won. He scored another triumph. He had the respect of his associates. As the day dawned at the end of their deliberations, they asked him to lead them in prayer.

Full-armored, the worn man of faith took the majority report to the Madison Square Garden, which had been mechanicalized as every one knows—now—into an Al Smith self-nominator, guaranteed to run an hour and forty minutes without recharging. It was not just the atmosphere to take a tired mind and body into.

There came Bryan. He arose at the end of a four-hour debate, about one o'clock on Sunday morning. Quite all right for one whose religion and politics had never been strangers. The better the day the better the deed. His fatigue was evident. For nights, he had not slept. His face was deeply lined. Beginning, as was his wont, in conversational tones, his introductory was scarcely audible, for the Garden rocked with tumult, and it was some time before Chairman Walsh could restore order.



But interruptions and taunts were the Commoner's tonic.

"I'm getting to be an old man, and this will probably be my last platform appearance," he said as he asked for quiet. There were cheers at this, whereupon he added: "But don't be too sure about it. I may fool you by coming back!"

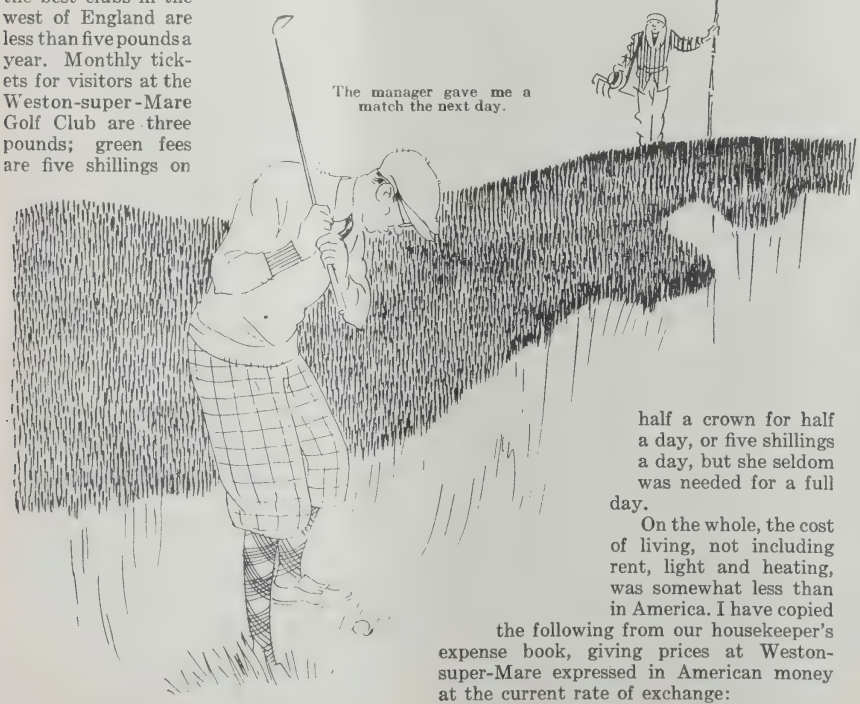
It was his last convention, as he had prophesied.

# I Rented a House in England

(*Concluded from page 2*)

We found our summer clothing utterly useless.

English banks was strengthened during the succeeding five months. First of all, the English bank official is, by education and tradition, a man of courtesy and more or less social distinction. Particularly outside London, he is a man of standing in the social life of the community. It is also true that he has a better knowledge of over-sea people than the officials of the other activities in the economic life of England and, I may add, a far better knowledge of America than the average professional man of England.



The bank manager called at our house in a semi-formal way, before accepting my account. Doubtless he desired to know, as fully as possible, for good business and social reasons, what sort of people we were, and he wanted this knowledge before taking our money in his bank.

When we had completed the preliminaries of opening an account, the bank manager, noticing my bag of golf sticks in a corner of the room, at once offered to put me up at his golf club and give me a match the next day. We knew no one in the town, and I was indeed glad to accept. So I met, at the golf club during the next three months, a number of the representative men of the countryside within a radius of twenty miles and experienced the charm of English society. In all of this, the bank manager was the chief agent. From this, and from later observation in other parts, I was led to the belief that the great banking houses have unobtrusively taken over the pleasant duty of welcoming over-sea visitors to England and extending England's hospitality in the most practical way, by introducing strangers into the social life of England.

The cost of golf is very low compared with America. The average annual dues of the best clubs in the west of England are less than five pounds a year. Monthly tickets for visitors at the Weston-super-Mare Golf Club are three pounds; green fees are five shillings on week days; this is the tariff at Burnham-by-Sea, one of the great championship courses, situated also in Somerset. But there are many other courses in that section with green fees at half a crown (two shillings and six pence) a day. Later in the season I played half a dozen of the courses in and near London. The North Surrey Golf Club—a typical club—at Streatham in South London, charged half a crown on week days and double on Sundays. The highest fee I paid in England was at Hendon, not far from Wembley, within the limits of London—quite a "swagger" club—charging ten shillings on Sunday.

The cost of golf balls ranges from 35 cents to 70 cents. Clubs cost about one-half the American prices. Caddy fees average one shilling and six pence, or 36 cents, for eighteen holes, all over England. I was given to understand that the cost of the game in the northern counties was much lower.

Unquestionably, the cheapest commodity in England is domestic help. We had a housekeeper who assumed entire charge, and was a good cook, who asked twelve shillings a week. After a little while I voluntarily increased her wages to eighteen shillings, or about $4.25, and she was entirely satisfied. Another woman came in to do the washing and cleaning for half a crown for half a day, or five shillings a day, but she seldom was needed for a full day.

The manager gave me a match the next day.

On the whole, the cost of living, not including rent, light and heating, was somewhat less than in America. I have copied the following from our housekeeper's expense book, giving prices at Weston-super-Mare expressed in American money at the current rate of exchange:

Eggs, 45 cents per doz.; bacon, 39 cents per lb.; steak (best), 39 cents per lb.; chicken, 37 cents per lb.; roast beef (sirloin), 34 cents per lb.; brisket, 22 cents per lb.; canterbury mutton, 34 cents per lb.; spring lamb, 42 cents per lb.; veal, 43 cents per lb.; sugar, 9 cents per lb.; rice, 12 cents per lb.; white bread, 9 cents per 3-lb. loaf; brown bread, 12 cents per 2-lb. loaf; butter, 45 cents per lb.; milk 10 cents per quart delivered; cream (Devonshire solid), 68 cents per lb.; tea (good quality), 70 cents per lb.; coffee (good quality), 70 cents per lb.; potatoes, 4½ cents per lb.; broad beans (larger than Lima beans), 5 cents per lb.; peas, 4 cents per lb.; cabbage (average weight 3½ lbs.), 6 cents each; cauliflower (average weight 4 lbs.), 8 cents each; plums, 16 cents per lb.; oranges (rather small), 4 cents each; apples, 8 cents per lb. (about 4 apples); onions, 4 cents per lb.; cheese, 38 cents per lb.; coal (Welsh bituminous for grate use), $11.50 per ton.

Gas and water bills are collected quarterly. The cost of water and gas for our house for twelve weeks was one pound seven shillings, or $7.60. As we used the gas for both heating and lighting, there being no electirc wiring in the house, the cost was surprisingly low.

Smoking tobacco—pipe and cigaret tobacco—is about three times as costly as in America.

A fair cigar can be had for a shilling, about the same quality as the American two-for-a-quarter cigar.

We found the quality of practically all foods superior to that of the same name in America. The bakers' bread from the shops was so superior to the bread sold in New York as to astonish us. Potatoes had a delicious flavor unknown to us in the States. All other green vegetables seemed larger in size and more delicate in flavor. So with native fruits, particularly plums, which have an exquisite flavor and are abundant. The apples, of all the native fruits, seemed to us inferior to American apples. Of course the oranges were imported, and most of the grapes. Some grapes are grown in England "under glass."

Clothing, for both men and women, was about 40 per cent cheaper than in America. This does not include boots and shoes, which we found to cost almost exactly the same as at New York.

Of all clothing, sports suits were the

cheapest and best, costing less than half the price at New York.

We had brought with us across the seas summer clothing, such as one wears at New York in July. We found it utterly useless. Hot weather, such as all Americans know, is unknown in England. At Weston, during July and August, the temperature last year rarely rose higher than 70 degrees in the sun. The average at night in the house was lower than 60 degrees and fires in the fireplaces were needed.

We quickly found that woolen underclothing, such as one wears in late November at New York, was most comfortable for summer wear in England.

One might say, with very little exaggeration, that there are no ice boxes nor cellars in England. Provisions keep in summer above ground without ice. The pantry, or "larder" as it is called, is fitted with a small screened window open to the outside air, and that is all that is necessary to keep meats and vegetables fresh.

Above all, the American traveler before starting out should remember that it rains nearly every day in England. This may not be literally true, but I feel sure that the average American who has spent five months in England will say so, in the way we have of sizing up things.

But rain is England's greatest blessing. The country is surpassingly rich in green and amazingly beautiful because of the rain, and the soil is the most fertile in Europe. So the English people make no fuss at all about wet weather. To be wet is the normal condition of the race. They trudge in the rain unconcernedly. Shopping and outdoor work go on just the same, wet or dry; golf and football games go on unless the rain be a regular downpour; tennis does not stop because of a drizzle; even cricket, the dryest of the games, will go on in weather that would cause the "calling" of a baseball game.

One may often see hundreds of people standing or sitting in the rain, listening to an open-air band concert.

I saw a religious meeting in the open air at Weston, an eloquent preacher addressing 1,500 people for three quarters of an hour, and all the time the rain fell steadily, but the preacher held all his audience and carried on without taking any notice of the rain.

And hardly anybody in England wears "rubbers." They do wear substantial shoes and woolen stockings. Strangest of all to me, nobody in England seemed to catch cold from wet feet. This sane and healthy characteristic of the English climate remains the most salient of my memories of the five months' stay in that country.

England is a paradise for automobilists. The roads everywhere are good. But one must remember that the rule of the road is "turn to the left." I did not dare to drive myself, but after a couple of months I got used to the turning left.

From Weston, in the first week of October, we went to London and took a flat there —but that is another story.

**The Treasury Department at Washington**

has been returning dissimilar rulings in similar cases.

Why? And why secrecy?

# Why Is America Invited to Disarm?

(*Concluded from page 5*)

of liberty, but the United States is not willing to make such a concession to Japan. It is extraordinary that a wayward and selfish nation intends to promote a conference of such lofty principles.

"It is a mystery to us that so earnest an advocate of peace as the United States hesitates to sign the Peace Protocol and to join the League of Nations. Her sincerity is greatly doubted. Does not the United States see how assiduous Japan is to strike out the causes of war and to prohibit resorting to arms?"

Japan raised the immigrant issue at the Washington Conference. She will press it again at the second Conference. This is the reason she wants the United States to join the League of Nations. She will no doubt attempt to hail the United States before the World Court on the issue.

It must be admitted that the Japanese press is logical in insisting that the limitation of arms will not remove the source of irritation between the United States and Japan. Until the American people are ready to welcome Japanese immigrants of all classes to our shores there will always be a possibility of war, despite the hypocritical pretensions of the diplomats of both nations.

***Merchant Ships May Become the Sea Power***

All of the nations that are represented at a second Arms Conference will have their price for entering into any agreement with the exception of the United States. Despite the agenda that may be formulated at Geneva the discussion will take a wider range and may take unexpected turns.

There is a report in well-informed circles that Great Britain will bring forward a proposition for the elimination of battle or capital ships, making the limitation on warships the type of light cruisers now being built. It is even suggested that the tonnage will be fixed below that of the *Omaha* class of the American Navy.

On the face of it, this would appear to be a great stride in the limitation of naval armaments. The capital ship is the largest, and therefore the most expensive, naval vessel afloat. Contrary to the general impression, it does not cost as much per ton as the smaller sizes. Great Britain could reasonably expect support from France, Italy, and the smaller nations to any proposal that would eliminate battleships. Even Japan would not interpose very strong objections.

The adoption of such a proposition would be the death knell of American sea power. The United States would not longer be rated as a first-class sea power. With all of its wealth and interest at stake in the affairs of the world, it would then rank with Italy, Greece, and the smaller nations.

To show how largely American sea power rests on battleships let it be assumed that all warships, from battleships down to mine sweepers, submarines, and even armed naval tugs, be scrapped under an international agreement. Then the control of the sea would pass to the merchant marine. In the event of war, nations would arm their merchant ships. The present steel-hulled merchant ship has more armor protection than a battleship previous to the Civil War. The nearer the nations of the world approach a condition under which all warships are scrapped, the more the merchant marine becomes the sea power of the nation.

The answer to the question as to why Great Britain would abolish the battleship is her overwhelming merchant marine. The danger of such propositions to the United States is shown in the rapid disappearance of American merchant ships from the seas. The war-built American merchant tonnage, which was such a great factor in winning the war, is being scrapped even more rapidly than its navy. With the battleships gone and the small force of cruisers, the American sea power is going back to the condition that existed just prior to the Civil War.

***The Future of our Battleships***

But it is not necessary for Great Britain to secure the adoption of such a radical proposition as the elimination of the battleship to start another boring-within process in the American Navy. Under the terms of the Washington Arms Conference the first replacement of American battleships will be in 1931. Three years prior to this, or in 1928, legislation authorizing two new battleships for replacements under the treaty will be up in Congress.

If the British diplomats can, with their foresight and acknowledged skill, create conditions under which negotiations for the elimination of battleships may be pending, how difficult it will be to secure any legislation for the authorization of building two large battleships. With the coöperation of the pacifists in Congress and in the country, the legislation may be held up from session to session, and even after the ships are authorized adequate appropriations may be withheld and thus postpone the building of the ships. Opportunities will be afforded at the second Conference for the introduction of all sorts of propositions which will delay replacement in the American Navy under the treaty.

***The President's Attitude to Other Nations***

President Coolidge has one advantage over President Harding in entering the Conference. Despite the efforts of the British diplomats to create a contrary impression, it is pretty well understood that it is a British affair. The American delegates should regard themselves as guests at the party, and this should be made plain to the American people. It entirely rests upon Great Britain to make a success of the Conference. Only the pacifists and internationalists will protest if President Coolidge refuses to make another sacrifice of the American interests at the second Conference.

But will President Coolidge take advantage of this situation? Will be continue to out-maneuver the British diplomats in the affair? In suggesting that the Conference be held in Washington, Great Britain is attempting to shift the responsibility for its success upon the shoulders of President Coolidge. If it is held in Washington it will be necessary for President Coolidge to issue the invitations to the other nations. Unless President Coolidge makes it plain that the invitations are issued at the request of Great Britain the popular mind is apt to regard it as a Coolidge affair. It is the popular impression that frequently controls elections, and herein lies the great danger to the American people if the President is a candidate to succeed himself.

A COUNTRY which claims as its sons Kosciusko, who fought with Washington for American liberty, and Henry Sienkiewicz, famous author of *Quo Vadis?* is of interest to Americans. Of the purest Aryan stock, the people of Lithuania have preserved a language which is the only modern European survival of the ancient Sanskrit, and yet they teach English in their public schools to foster modern culture. Capital punishment has been abolished. More than 1,000,000 Lithuanians live in the United States. The author of this article came to the United States from Lithuania in 1897. He served as a chaplain in the American Army in France during the World War.

# Lithuania—the Country of Kosciusko

By REV. GEORGE F. JONAITIS

ON AN October night in 1890 I was sitting on an upturned well-bucket in my father's home on a small farm near Kurshany, in Russian Lithuania. My mother was reading to me from a Lithuanian prayerbook. I was ten years old.

Suddenly there was a hammering on the door, and before I could open it the latch was smashed and a Cossack burst in. My mother hid the prayerbook under her dress.

The Cossack, a burly fellow with terrible-looking moustache, grasped my mother's arm:

"Where is it? Where is the Lithuanian book?" he roared. "Come, I heard you reading the forbidden tongue."

My mother cried out when the Cossack twisted her arm. I kicked at his shins, but his big boots only hurt my toes. He kicked me into a corner.

"Then if you were not reading you were talking your language. And the Little Father forbids that too. You know it," said the Cossack, and he began to overturn the table, the fish-barrel, the chairs, looking under everything for the forbidden book. He kicked an earthenware butter-jar from a low shelf and it smashed to bits on the floor. It was five months before my father could buy another crock. Money was not often seen in a peasant's home in that part of Russia in those days.

Finally the Cossack went out. He was singing the Russian national air, a church hymn, as he wiped from his moustache some homemade beer he had found in the cupboard.

"You, you young fighter," he jeered at me as he went out, "you'll do your good fighting in the Little Father's army, if you don't kick your way into the mines on Cossack shins." And he went out content with having done his duty.

The mines he talked of were in Siberia, somewhere off in the east, cruel, cold and eternal. I knew from the stories of my mother.

My mother took the prayerbook from under her dress and read it again, but in a voice that was almost a whisper.

That was Lithuania in 1890. Priests were hunted down. Some were shot, more were sent to Siberia. In forty years, from 1864 to 1904, only about twenty Catholic priests were ordained in Lithuania. They would come from their ordination in Germany and go shortly to the mines or their graves. I believe my vocation for the priesthood was largely furthered by that thing in human nature which makes proscribed professions appealing to a man with red blood in his heart. That, and my mother's determination that I should have an education in spite of Romanoff ukases.

To most Americans Lithuania is just a "country in Europe," created by the Great War. Few could locate it readily. But Lithuania has lived with an unchanged language and customs, and a national spirit longer perhaps than any other European race. The language is unique. Only the ancient Sanskrit, of known tongues, resembles it today, and so well has it been preserved that a Lithuanian sailor, landing in India, has been able to find his way about among the Hindus by using the Lithuanian language.

The Lithuanian is probably the purest Aryan stock in Europe. Undoubtedly it came from Asia, but when, history does not certify. It has kept itself unmixed of other races, largely, in the fastnesses of forest and lake that lie between the Baltic and the Black seas.

Slavs have poured over this land; Tartars have come with fire and sword; Poles have fought with Teutons there; the Turks' advance on Europe burned out in our marshes; but Lithuania has kept its language, its history and its racial entity.

Today Lithuania, as shaped by the peace treaty and the League of Nations, lies surrounded by East Prussia, Poland, Latvia and the Baltic Sea. The Letts of Latvia are a kindred people, differing mostly in that they are Lutherans. Their language is a Lithuanian dialect.

Practically all of Eastern Poland, the "corridor" that lies between Lithuania and Soviet Russia, is historically and racially Lithuanian. The majority of the inhabitants of these districts, Vilna, Grodno and part of Minsk, are true Lithuanians. It is hoped that these will be added to the republic peacefully. Lithuania now has about 3,000,000 people. If these provinces are added the population will be about 6,200,000. If there is a political union later with Latvia, which is probable and is being considered, the combined countries will have about 15,000,000 inhabitants.

The word "Prussian" is a corruption of the Lithuanian "Borussian." A stem of the Lithuanian race occupied anciently what was the Prussia of 1914. But in the thirteenth century that country was overrun by the Teutonic Knights and thoroughly absorbed into the German race. Prussia, therefore, is a political, not a racial designation today.

Memel, or Klaipeda in Lithuania, is the chief port of the country. The free port of Danzig is nearby, and, if the union with Latvia comes, there will be the harbor of Riga, one of the finest in North Europe. All these are on the Baltic, the great sea which gets its name from *baltus*, Lithuanian for "white." As indicating the antiquity and early influence of the Lithuanian tongue we have the word *gallus*, meaning "land's end," which undoubtedly gave to the Romans their "Gallia" for the France of today.

The racial characteristics of the Lithuanians—about 87 per cent of the stock is still unmixed—is a long head, blue eyes, straight nose, over-white skin, and inclination to tall stature. They differ in many ways, besides speech and customs, from the Slav, Teuton or Pole.

Elisèe Reclus, in his *Geographie Universelle*, says: "The Lithuanians, together with their brothers, the Lettons (Letts of Latvia) constitute a nation, a race apart, composed of men who are very intelligent, full of fancy and poetry."

In a preface to the Lithuanian Grammar of Milke, Kant, the great philosopher, says: "The Lithuanians are fair-dealing men, full of the consciousness of their personal dignity." There have been hints of Kant having been of Lithuanian extraction, but this has been disputed.

The spirit of true democracy has always been a Lithuanian virtue, of which the people are proud. From savage clan, through feudalism, kingdom and empire the "council of the people" has ever been the ideal of government with the Lithuanian. In America he becomes an American easily. While he preserves his natural love of the land from which he came, and his pride in its history, he is absorbed easily, by inclination, temperament and aspiration into the body of a people who evolved and have kept alive the first real democracy. There are about 1,000,000 people in the United States who were born in Lithuania.

The attention of the world was focused recently on Lithuania when on January 9, 1923, a volunteer army of Lithuanians, from the country immediately adjacent to Memel, stormed that port and captured the French garrison installed there by the Allied High Commission. Generals Budrys and Simonaitis led the assault. The Allies approved the seizure, and Memel is now developing a healthy trade for Lithuania.

President Alexander Stulginskas, of the Lithuanian Republic, has since credited the sudden and bloodless action that added Memel to Lithuania to an American sailor, who served in the United States Navy before and during the World War, and who was visiting on furlough the Lithuanian village in which he was born. This American tar organized into an efficient attacking army a peasant militia from the farms of the Lithuanian countryside surrounding Memel, and when the assault was made on the city an American flag was flying side by side with the Lithuanian banner at the head of the attacking column.

In Arlington cemetery there is the grave of Lieutenant Samuel Harris, U.S.A., who, after the World War, threw himself into the struggle of Lithuania for freedom, enlisted in the Lithuanian Army, rose to a commission, and gave his life in battle against the Bolsheviki before Kovno. Harris was an

American descended from several generations of Americans, and, when, in France, he learned that Kosciusko was a Lithuanian, not a Pole as most Americans have believed, he threw in his lot with the land of the knightly Lithuanian who had helped America in its struggle for freedom.

Lithuania has adopted a military policy of a small "skeleton army" of regulars around which can be built a war footing drawn from a citizen militia kept in training without interfering with industrial activity.

The new republic is putting into practice the advice of Napoleon to the assembly of the Cispadane republic at Modena, which he set up after driving out the Austrians: "Never forget that laws are mere nullities without the force necessary to support them. Attend to your military organization, which you have the means of placing on a respectable footing."

Lithuania has been unusually fortunate in the unity of its people toward democratic government without threats of anarchy induced by personal ambition.

Vilna, ancient capital of Lithuania, is in the hands of the Poles and all the province of Vilna, besides that of Grodno, and the half of Suwalki not already occupied by Lithuania, is claimed by the republic. The people of these provinces, with the exception of perhaps 20 per cent of Polish descent, and 10 per cent Jews, mostly living in cities, are true Lithuanians, by blood, language and customs. Minsk, an adjoining Soviet state, also is largely Lithuanian.

The new republic has not declared it will war with Poland or Russia over its claims to these lands, but it has informed the League of Nations that it will not accept any decision for the disposal of the disputed territory until a plebiscite has been taken, at an early date, to prevent further Polonization or Russification.

Ancient Lithuania stretched from the Baltic to the Black Sea. Its eastern boundary was a line running from the mouth of the Dneiper, along that stream and thence to the mouth of the Duna. On the west the boundary ran from the mouth of the Vistula, along the Carpathian Mountains and down to the mouths of the Danube. This territory now includes Lithuania, Latvia, East Prussia with Danzig, Eastern Poland, Galicia, Moldavia and Bessarabia, White Russia or Minsk, the Ukraine and the Crimea.

The pagan tribes of this vast region of swamp, sparkling lakes and thick forests, lived their lives of hunting, agriculture and fishing, far back into history, retiring into their forests while the barbarian hordes swept over their lands to appear in history against the Roman Empire and during the early Middle Ages. They had no touch with Europe save perhaps their trade in amber, which was sent from the Baltic to Rome of the Emperors to decorate its beauties.

They worshiped in their forests on open altars. Parkunas, the God of Thunder, was their Supreme Being and God of Gods. Next below him were Patrimpa, God of all good things, bounteous crops, teeming lakes and plentiful hunting, and Pykoulis, the God of punishment. There were many minor gods, and a priesthood descending in families, as the Levites in Israel.

As Slavs, Tartars, Poles, Germans and Turks swept across the land, the Lithuanians retired into their forests and swamps and their limits began to contract.

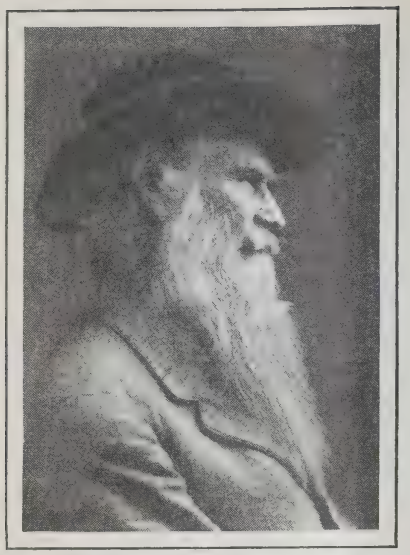
The consolidated tribes first appear in history as a war-power in 1316, when Gediminis, Grand Duke of Lithuania, gave his daughter Aldona in marriage to Casimir, son of the King of Poland. Her dowry was 24,000 Polish prisoners set free at the wedding, and seems to indicate military ability on the part of her father.

POLAND LITHUANIA & LETTISH COUNTRY.

POLAND LITHUANIA LETTISH COUNTRY.

From that time the history of Lithuania became almost inseparably connected with that of Poland. But Lithuania ever retained its own language, customs, money and tax system, and there were times when the countries were not only separated but actually at war with one another.

After 1864 Russia, which had ruled Lithuania since the Partition of Poland, ordered the suppression of books printed in Lithuanian.



Then followed a "war" that would have been a comedy were it not for the exiles, whippings and stagnation of learning that went with it. Russian agents would seize at the border Lithuanian books printed in Tilsit, and burn them. Lithuanians, given Russian schoolbooks and Polish prayerbooks by the government, would burn them. Thus war was fought with fire, with books the only victims, and publishers waxed rich. But Lithuanian mothers kept the language alive by teaching their children from precious, hidden books in darkened cottages and farmhouses. From 1840 on, by an imperial ukase, even the name of Lithuania was banned in Russia, and the region was known officially only as the North East Province.

Since 1904, following the threat of an uprising coincident with the Russo-Japanese War, the ban on Lithuanian print has been lifted.

Today Lithuania is shaping itself with the United States as its model. It is teaching English in its schools, considering it the business language of the world. It is rebuilding its roads on American specifications. It has a permanent commission in America to study trade, industry, building, manufacture, farming and cattle-breeding. It has abolished capital punishment. Its principal products are rye, flax, potatoes, oats, barley, cattle, hogs, horses, hides, and poultry. Its manufacturers include brick and tile, glass, linen, iron tools, meat packing, and beer. Its vast forests are being developed for timber and woodpulp. It has an area about that of Kansas, and if it gains the territory claimed it will add land as extensive as Maine, giving it a total area of 112,000 square miles or about the size of Michigan and Wisconsin combined.

# A Close-up of Joaquin Miller

(Concluded from page 3)

Joaquin Miller, in later life.

liar Joaquin was never excelled and seldom equaled, yet I cannot imagine that he ever in his life was guilty of a lie for the purpose of taking advantage of anybody. Joaquin told whoppers just to be a good fellow, to amuse and entertain his auditors or to shock them. As entertainment he used to tell such yarns as the one about the five years he lived with the Modoc Indians, though competent authorities say he was never near enough to the Modocs to have seen them with a telescope. Here is an example of the fibs he used to tell to shock people:

It was for months his habit to appear promptly at 5 o'clock in the afternoon and stand exactly upon the threshold of my office, never saying a word until I had turned and spoken to him. One afternoon in the dead of winter when it was already dark he appeared and asked me if I would go with him to a bazaar that the society women of Washington were holding and at which Miller's daughter, Juanita, was in charge of a booth. The purpose was to pick Juanita up and take her home.

We had no more than entered the great building in which the bazaar was being held than one of the society women spotted him and started toward him as rapidly as her high heels and tight shoes could carry her.

"Oh, Mr. Miller," she began, "I am *so* glad to meet you. I am Mrs. Blank and I have always had the greatest admiration for your poetry. And you have *such* a charming daughter."

Joaquin never batted an eye or said a word. As the silence grew into seconds a strange look came into the woman's eyes. Still Joaquin said nothing. Panic began to peep out from under her eyebrows.

"Are you not Mr. Joaquin Miller?" she asked in a tone that indicated she was undecided as to whether she should run or faint.

"I am not," replied Joaquin.

The woman was undoubtedly convinced that he was lying, but she was not quite ready to give up the chase.

"You are *not* Mr. Joaquin Miller?" she repeated, almost plaintively.

"No," he lied again.

She let her eyes rest upon him for a second or two more, then turned and walked rapidly away, obviously tremendously embarrassed and probably good and mad. She knew she had been bunked but couldn't prove it.

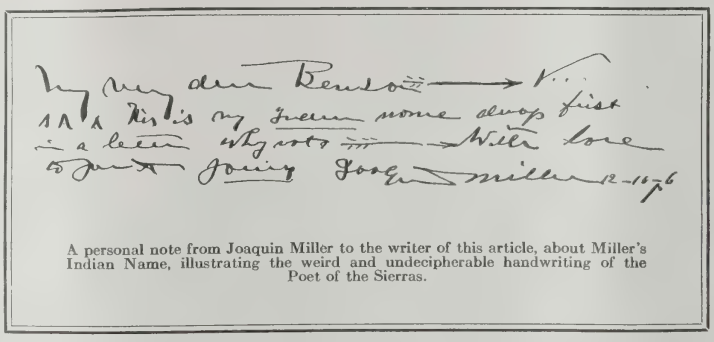
The great knight errant, Fate, however, is always lying in wait to avenge the wrongs of fair ladies, and a few days later President Roosevelt bumped Joaquin harder than Joaquin had bumped the lady; at any rate, Joaquin thought so, though I didn't.

It came about this way: Joaquin came to me one day with the suggestion that a World's Fair be held in Washington in 1912 to commemorate the hundred years of peace that had existed between Great Britain and the United States since the outbreak of the War of 1812. What Joaquin wanted to do was to write a page article for our Sunday magazine section proposing the thing and have me print it. I told him to go ahead.

I had the stuff stuck in type and gave him proofs of it. Then he had another great idea. Why not take the proofs over to the White House and have Roosevelt approve the exposition idea? Roosevelt was a friend of his. He had even begun one of his western books with a verse from one of Joaquin's poems. The other proofs were so dirty by this time that I had new ones made on nice glazed paper and one morning we sallied forth for the White House.

***When Miller Went to See Roosevelt***

We were ushered into the Cabinet room where about 40 others were waiting. Roosevelt was in his little office, just off the Cabinet room. Pretty soon we heard the President's high falsetto voice call out: "Mistah Millah, I will be out in a few minutes." Roosevelt always softened his "r's" in true New York fashion.



That wasn't so bad. Everything was promising so far. Pretty soon the President came out. The whole bunch of us arose and instinctively formed into line to meet him. When Joaquin got to Teddy he pushed the proofs into his hand and began telling him all about it. Roosevelt looked at the proofs a second or so in a troubled sort of way and replied that he couldn't think of taking time to read them then and that Joaquin might leave them.

What more could Roosevelt have said? Obviously he couldn't let a considerable number of other men wait while he read six galleys of newspaper print. But Joaquin apparently had expected that Roosevelt would do just exactly that. At any rate, he was tremendously crestfallen. He never said a word until we had got out of the building. Then he said: "I would not have had that happen for gold."

When Joaquin came to Washington he found a home awaiting him; also a wife and daughter whom he had not seen for years. The home was an apartment belonging to Mrs. Miller's sister. I was often a guest at this place and never saw a happier home. Joaquin's wife, daughter, and sister-in-law, each of them treated him as if he were a king and he treated each of them as if she were a queen. Joaquin would sit at the head of the table with a dull reddish skull cap on his noble head (he had a fine forehead, splendid blue eyes and a strong nose) and a loose house coat flowing from his shoulders—he looked something like an ancient king. After dinner he would ask his daughter Juanita, a very lovely girl then in her twenties, to play on the harp, which she did well. It was wonderful to witness the kindness and courtesy with which this old man treated his daughter. He was gentleness itself.

***He Looked Something Like an Ancient King***

All of this mutual courtesy would not have been so remarkable if the fact had not been that Joaquin and his family never lived together and seldom saw each other. They were friends but did not mind a continent between them. Joaquin never had stayed much with any of his wives, and he had had three; the first a squaw, by whom he had a daughter; the second, "Minnie Myrtle," a California newspaper woman, whom he met on a Tuesday and married on a Thursday, by whom he also had a daughter, both of whom he left in a few years; and lastly, Abbie Leland, the mother of Juanita.

A personal note from Joaquin Miller to the writer of this article, about Miller's Indian Name, illustrating the weird and undecipherable handwriting of the Poet of the Sierras.

Sometimes he would take me to call on an old friend of his, Vinnie Ream Hoxie, a sculptress, and the wife of an army officer; the sculptress, by the way, who made the Farragut statue in Farragut Circle, Washington. Mrs. Hoxie at that time was working on a great statue of Alonzo Cornell, which is now at Cornell University, and she used to show us this statue and call it her "big man." Many a happy Sunday afternoon or evening we passed in her studio. She too had a harp upon which at Joaquin's request she used to play. In return, he would recite for her his poem "Columbus." That poem is now in American schoolbooks, and Americans will still be reading it when airplanes are doing in ten hours what Columbus took two months to do. So long as America is America, that poem will never be forgotten.

So far as Joaquin's dress was concerned, he was a fake. He liked to appear much more uncouth and careless than he really was. I remember one day when we were

passing Harris & Ewing's photograph gallery in Washington, Martha Ewing came rushing out to request Joaquin to come in and pose for some pictures. When he went in his trousers were outside his boots, but when he faced the camera he pulled one trouser leg above his boot-top and left the other where it was. He gave me a fine study of his face and under it made a few Indian symbols resembling wigwams, hatchets, and so forth, and added: "My Indian name, always first in a letter—why not? With love to you and yours, Joaquin Miller."

On a stormy day in March, Joaquin left for California and I never saw him again, though I heard from him to the end of his life. Once in California, where there was no winter, poems began to come to him and one of these poems he sent to the San Francisco *Bulletin*. A few days later he called at the cashier's office for his pay. The cashier handed him $10. Joaquin yelled murder, declared he had been insulted and expressed interest as to just what kind of a fool the cashier took him to be. R. A. Crothers, owner of the *Bulletin*, happened to be standing near and moved over to ask what the row was about. Joaquin told him and repeated that he had been insulted.

"I see, I see," replied Mr. Crothers. "Now let's fix this thing up. Suppose we make that $15 instead of $10?"

"Oh, *that* will be all right," replied Joaquin, instantly mollified, for he had the simplicity of a child.

Miller was not a great poet because he had nothing much to say. But if he lacked in thought he was bursting with feeling and he had a wonderful sense of color. Some of his poems are as gorgeous as a desert sunset, some resound like the echoes of thunder in the mountains. Nor will the glamour that he put on California ever come off. Outwardly he was sometimes something of a charlatan, due mostly to his desire to make people sit up and take notice. Often he seemed to get a kick out of saying the unexpected, regardless of how little sense there was in what he said. Example: Elbert Hubbard, when he visited Miller's home, commented on the absence of books. "Books!" retorted Joaquin. "Books are for people who can't think."

But beneath the bluster, the faking and the buffoonery, Miller was a good deal of a man. But of judgment of the things that take place in the world of men he had none. When the Civil War was on it seemed to him fitting that the little weekly newspaper in Oregon, of which he was the editor, should espouse the cause of the South, for which his office was sacked and the type thrown into the gutter. On another occasion he took the part of some Indians and was thrown into jail by the whites. Later an Indian shot him in the leg with a bullet and another sent an arrow into his neck.

He couldn't get along with anybody but himself and his friends, not because he was bad, but because he had an instinct for taking what others believed to be the wrong side of questions.

Once he tried to establish an Indian republic at the base of Mount Shasta, an act of folly for which Joaquin said he would have been hanged if he had been old enough. When he left Washington he told me he was going back to Oregon and run for the United States Senate. He had not lived in Oregon for 40 years, but that did not matter. "Someone like me is needed," he told me, "to arise in the Senate and fittingly portray the matchless beauty of this great state."

# Some Building and Loan Pitfalls

(*Concluded from page 12*)

through straw men. Within a few years, by the beginning of 1925, he had brought together a group of seventeen associations. Isidore Griver was secretary of all of them. The directorates interlocked. Under Roseman's direction all were used in the same way.

Roseman had discovered that banks took building and loan paper for granted. The law provides that an association may borrow up to twenty-five per cent of its paid-up stock for the purposes of buying mortgages, and Roseman knew that other speculators had exceeded this limit without getting caught. So he and his associates launched a carnival of speculation on borrowed funds. When the paid-up stock records were not sufficient to justify more loans, they simply altered the records. After a time they even began to sell stock certificates which they swore were paid up. In other words, they simply tore the certificates from a book, had all the officers sign and then peddled the stock among the banks for whatever they could get.

It is significant that even when the extent of these operations were revealed many big speculators and money lenders bitterly criticized the State Banking Department for taking over the seventeen associations. It was argued that if the Roseman group had been allowed to work out its own salvation, the natural increase in realty values would have made up for the losses in time. That argument is now recognized as absurd.

It has been proved that it is possible to wreck a building and loan association.

The great majority of building and loan associations, of course, are safe. But the widespread nature of the speculative practices that led to the downfall of the Roseman group is indicated by this statement made from the bench by Judge Harry S. McDevitt when the defendants were lined up before him to be sentenced.

"We must let those not in this case who are doing the same thing, or worse," he said, "realize that they cannot break the law and escape punishment."

After the arrest of Roseman and his associates it was freely predicted that none of them would ever go to jail. The theory was that the bankers who had handed over hundreds of thousands of dollars for worthless pieces of paper—not only to the Roseman group, but to others—would swallow their losses to protect themselves. If the State Banking Department had been willing to overlook embezzlement, larceny, fraudulent financial statements, conspiracy and a lot of other crimes to which the criminals later pleaded guilty, the matter might have been hushed up. But when the case got to Judge McDevitt all hope of this ended.

Attorneys for the defendants carried one appeal for delay to the State Supreme Court, after the lower court had announced that the case must go to trial. McDevitt was upheld. Trial was started on two indictments naming five of the conspirators. Of these, William D. Rodgers and Jacob Marbin elected to stand trial, while Roseman and Samuel B. Lush pleaded guilty, and Griver pleaded *nolo contendere*, or no defense. All three took the witness stand and admitted all the charges made against them. A verdict of guilty was brought in against Rodgers and Marbin, who then changed their pleas to no defense on the remaining indictments.

Rodgers was sentenced to ten years, Roseman to eight years and Marbin to seven years in jail. Griver, secretary for all seventeen associations, drew six years when it was shown that he did not profit to the same extent as the leaders. Other prisoners and their sentences are Harry Gottlieb, two years; Rudolph C. Bender and Max May, one year each; Martin Q. Kline, six months; Frank W. Bless, three months; Sidney Fridenberg, three months; William Fields, three months; Maurice Kline, three months; John B. Magee, $1,000 fine and five years' probation; Alfred Scarlett, $500 fine and three years' probation, and Herman Lush, five years' probation. Samuel B. Lush remains to be sentenced.

Pennsylvania is now planning to reintroduce bills in the legislature which shall draw a sharp line between the speculative form of building and loan, devoted to syndicate loans on central realty, and the original home owners' system. It is possible that a special session of the assembly may be called to consider this and other questions. Other states, where the building and loan system has developed on a large scale, probably will take similar measures to prevent a repetition of what happened in Philadelphia. At present it is impossible so long as the officers are honest men. But unless shareholders exercise real control over their associations speculators often may gain control of them, and once that happens anything is possible.

# Whistling Wings

(*Concluded from page 17*)

the water and one of these soon fell exhausted. The others felt themselves pulled down as by an invisible weight. A greasy, black substance penetrated the feathers and burdened the wings.

Another great troop of Redheads, flying in a close body, came along, making a roar like thunder, as their long, strong wings beat the air. They were about to alight but observing their dying comrades they continued their flight leaving their kin to be washed up on shore.

No more would Bronzehead lead his flock into the northern wilds. No more would the Cajuns welcome them home in winter. The *canard violon* of the "swamp angel" lay rotting on the Atlantic seacoast, together with hundreds of his kind.

This crawling, deadly, insidious oil from ocean-going vessels will not mix with water. It accumulates more dirt, becomes thick and viscid. With its ropy, glutinous consistency it spells destruction to the ducks and other birds alighting on the surface of the sea where it is prevalent. It will continue to do so until we somehow contrive to keep a clean ocean. Ocean steamship companies, particularly the oil burners, will probably be glad to coöperate in order to conserve the game that we have protected in partnership with Canada. The white sands of our ocean beaches will be saved from becoming greasy, slimy masses of oily muck, and the surf vegetation will be saved from the deadening and smothering effect of a floating mass of grease that always carries with it dead ducks, fish and other dying organisms. It is something that no one will want to see reach its climax.

# Measuring America's Soul

(*Concluded from page 8*)

Our psychologist critics show no adequate instrument for measurement and comparison. People seek throughout their works in vain for some formula which would entitle them to compare; nothing is available which could yield them title to condemn. There is lacking that formula which will divine unerringly the depths of the human mind, which will be unaffected by the superstrata of tradition and sectional culture and metaphysical predilection, which will penetrate the deeps of inborn influences and the greater deeps of those elemental repulsions of type and color—biologically beneficent, probably—to the bedrock of the common mind of man. Still, and in a sense deeper than is conveyed by the words,

"The wildest *dreams* of Kew
Are the *facts* of Khatmandu,
And the crimes of Clapham chaste
in Martaban;"

the Micrometer of The Mind is not yet!

How, then, do the over-sea psychologists achieve their comparisons? Superficial data commonly used against America, often merely local in source and evanescent in significance, can be ignored by those who are successfully handling the facts upon which the data are based; especially in view of the wider test available. The Arabs have a saying which might be commended to the attention of the bulk of the visiting psychologists: "The froth on the stream may go with the wind; the banks are cut from below." If our music and our dancing are negroized, that is but a phase. If our regard for law is open to question, it will be less so when the urge of development is succeeded by the closer organization of a developed land. In the attitude of the over-sea psychologist one seems to discern something of that lack of realization of the broad facts of America which marked the declaration by a distinguished over-sea intellectual destructionist that "the sinking of the *Lusitania* was the first fact about the war small enough to enter the American mind." In point of fact, the sinking of the *Lusitania* was *the first uncolorable, untwistable, unassailable fact about the European war which was ever presented to the American mind*—justifiably suspicious of the renewal of ancient European hatreds and rivalries with which it desired to have no connection. *And it was acted upon.* The European psychologists have not satisfactorily shown that they possess an instrument by which they can measure fairly the American soul. A means has been offered, nevertheless. The test was a wide-open one—world-wide. It was the most terrible test under which democracies ever shook. How did America, which has been declared to be "psychologically unsafe for democracy," behave then in the service of democracy and by the methods of democracy?

The answer is open to full examination. It is to be found in the history of the European war; it is given in the work of an army representative of the *whole* of America, in the bearing of that army in pursuit of a common purpose for the service of democracy. Other armies from the lands "psychologically safe for democracy" were there demonstrating their ability to submerge all differences in a common aim, toward an end deemed essential to the preservation of democracy. It is only necessary to view the demonstration less as a display of military strength than as a test of the psychological fitness of peoples to meet the demands and the manifold disciplines of democratic action, to obtain the perspective from which we desire to examine this assertion that "America is not psychologically safe for democracy."

Be it noted, again, that that top-section of the American people which was sent overseas was representative of *the whole of America*, of lands as varied in fact as those which sent to the British colors the Canadians, the South Africans, the Australians, the New Zealanders; it bore with it the American outlook such as it was, the American capacity for democratic action, such as it was—such ability and desire as it had developed to sink the personal, to move and act in common on the lines democracy imposes, to fulfill under new and bitter stress all the obligations of the ideal: "Of the People, by the People, for the People." No examination of trivial data could afford such a test of all America as that which was borne in the face of all the world. With what results? These:

America is the land of individual purpose. Individuality is marked. (That is one of the things which disturb the distant psychologist.) There is a similar marked individuality in the men of British colonies. Placed under like conditions, for a common purpose, for grim work involving a democratic submergence of individualism for the common good and an amenability to irksome disciplines, comparisons were possible between the peoples. Such comparisons involve no disparagement of any.

We have facts to present in demolition of the assertion that America is not psychologically safe for democracy; that is all. And one of these facts is that the war proved to the uttermost that in capacity to unite and submit itself to common action, the American people under arms compared well in democratic action with the soldiers of another race. The virile Anzacs, for example, lusty, dashing, devil-may-care, did not always find the common aim—the democratic demands of the situation—sufficient to submerge their prejudices; did not always conform to accepted method; had to be carefully officered by specially selected and acceptable types. The type had to be acceptable to the Anzac, moreover, rather than to the British War Office, than which point none was given greater care by headquarters. Remember, we are discussing only capacity for democratic action. As in the Boer War, so in the last war, the South African colonial too had his prejudices besides his patriotism and his democratic capacity. "We recognize no officer but a General, and no General but our own." The Canadian had his individualistic ways also, requiring skilled management. To go no further than these observations upon the peoples of most marked individualism, and most like the American, it is cold fact that the army records prove beyond any doubt that the American was second to none in his ability to move democratically under the most testing conditions.

The full tale of the individualistic peoples in their fulfillment of the obligations of democracy is at the disposal of the psychologist, in the war records. He will find that in loyalty to selected officers, in sincere desire to render adequate service, in discipline, in restraint, in tenacity, in whole-hearted devotion to what was democratic service in arms, America proved as essentially "psychologically safe for democracy" as any nation, to say the least of the matter. We have not heard it suggested that Canada, or Australia, South Africa or New Zealand are in any way "not safe for democracy." And while the purpose of these notes is but to direct attention to the more patent results of a great test applicable to one assertion of over-sea critics, the matter might be examined further were such an assertion worthy of it. Be it suggested, it is not. Of like stamp and similar lack of sound basis are many others.

One glance at the lands where democracy is "safe" should be sufficient for the American. A people sloughing the memories of bitter traditions for new and clean and wholesome mental equipment, and moving ahead on a path uncluttered with the rubble of old and savage codes and creeds, will test in cool leisure the pessimistic assertions of the alien psychologists and remain undisturbed. It will test them if it is not too busy, doubtless.

The American, it would appear, has not changed with the years. Individual purpose possesses his latest accessions from all lands. Practical progress and introspection do not flourish together.

"And while reproof around him rings
He turns a keen, untroubled face
Home, to the instant need of things."

## A Novel Defense

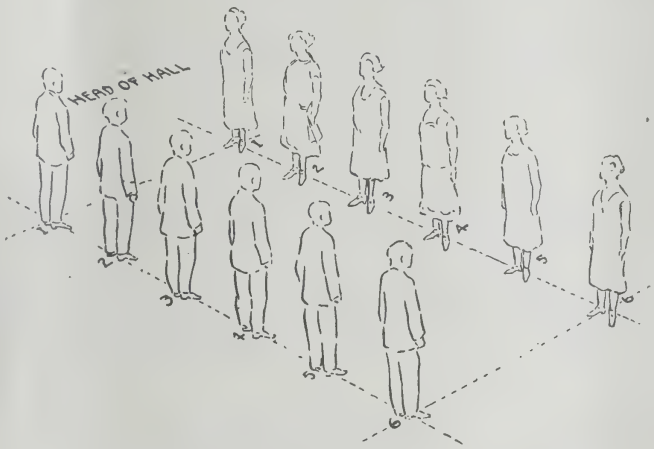
IF A PROMOTER sells property to the corporation organized by him, at an exorbitant profit, the corporation may go into court, cancel the sale, and compel the promoter to pay back his illegal profits.

All this is very trite corporation law, but in the case of Old Dominion Company vs. Bigelow, the promoter set up a novel defense when the corporation demanded an account of his stewardship and gains.

"My associate promoters and I hold nearly all of the stock of the corporation. If we pay back the cash it will increase the value of our stock, so we will be the winners just the same. Even if our profit was illegal, making us pay back is just like shifting money from one pocket to the other, and the courts will not force us to pay back considering that a very small part of the stock will be benefited by it, outside of our own."

The Massachusetts Supreme Court, however, was not impressed and ruled that the promoters could not rely on their own wrong in their own defense.

"If the argument were once allowed to prevail it would only be necessary to corrupt one single shareholder to prevent the company from ever setting the contract aside. It may be said you give to the shareholder, who was a party to the fraud, a profit, because he will take it in respect of his shares, and since, as between co-conspirators, there is no contribution, therefore his brother conspirators cannot make him repay his proportion. But the doctrine of this court has never been to hold its hand and avoid doing justice in favor of the innocent because it cannot apportion the punishment fully among the guilty."



# A Dance a Week

## The Virginia Reel—
## A Favorite of Many Years' Standing
## Also Known as the "Sir Roger de Coverly"

The very name of this dance stirs memories in the older folk and lively interest in the younger. Here is a dance which sets forth at its best the Anglo-Saxon spirit at play. For all the old dances were games of a sort—musical games. The Virginia Reel (also known once upon a time as the "Sir Roger de Coverly") is a pleasant game between six on a side, six ladies on one side, six gentlemen on the other. They line up facing each other. Then the movements of "head lady and foot gentleman" and "head gentleman and foot lady" make a pretty interlacing of patterns, until all six couples have played the game through.

The points are simple. Head lady and foot gentleman take the lead, and then head gentleman and foot lady alternate, in the same movement. That is, in the crisscross movements of the dance, two couples are engaged; the movement of head lady and foot gentleman and followed by head gentleman and foot lady. Each completed round leaves the former head at the foot, and so the line moves up until each couple has had its turn as head.

These movements are finished, so far as the head lady and her partner are concerned, with the reel. This is a rollicking reel down between the lines from head to foot. The couple begins the reel by turning each other around once *with right arms.* (Don't do it any other way, or the pattern is spoiled.) Each other with *the right arm.* This swings the lady over to the line of gentlemen. She turns the first gentleman once around in line with *her left arm* through *his left arm.* This swings her into the center again. In the meantime her partner has been turning the opposite lady in line, linking his left arm through her left arm, and, reeling, he is also swung into the center. The partners now swing each other once around with their linked *right arms.* And so they go reeling down the line. Remember, swing your *partner* with the linked *right arm.* Swing your side of the line with the linked *left arm.* You reel around the opposite party in line, which swings you back into the center, when you reel around your partner again, and then back to the line.

In this way you go down the entire line. Then the reeling couple take hands and chasse up the center to their places at the head of the line. The music changes into a march. Head lady and head gentleman turn and face the head of the hall and march, making a sharp turn toward the foot of the hall, or line. When the whole line is turned and the head lady and gentleman are now at the foot, they form an arch with their raised arms, through which the whole set goes through by couples.

This leaves the second couple now head lady and gentleman. And the dance is started again until all six couples have served as head couple.

Once done, with care, the pattern of the dance is very easily fixed in the mind.

Follow the directions carefully and the movements will become clear.

Metronome 116.

Formed in two straight lines, six couples in each set.

Do not walk through the changes, but use a light, springy, trot step, with plenty of action from the toes and ankles. The head lady and the foot gentleman begin all movements in the first period, and are immediately followed by the head gentleman and foot lady who execute the same change. The music and dancers start together.

Head lady and foot gentleman forward and back.....4 bars

Both advance forward four steps, meet, bow and curtsey, and return to place, each moving backward.

Head gentleman and foot lady forward and back.....4 bars

Head lady and foot gentleman swing with the right hands.....4 bars

Head lady and foot gentleman advance four steps, join right hands, "shoulder high" make one complete turn, drop hands, and return to place moving backward.

Head gentleman and foot lady swing with the right hands.....4 bars

Head lady and foot gentleman swing with the left hands.....4 bars

Both advance and swing with left hands.

Head gentleman and foot lady swing with left hands.....4 bars

Head lady and foot gentleman swing with both hands....4 bars

Both advance four steps, join both hands, make one complete turn, and return to place, moving backward.

Head gentleman and foot lady swing with both hands....4 bars

Head lady and foot gentleman dos-à-dos.....4 bars

Both advance four steps, passing each other right shoulder to right shoulder, each takes one step to the right side, back to back. Without turning, turn around each other, and move backward to place.

Head gentleman and foot lady dos-à-dos.....4 bars

Head couple down center....8 bars

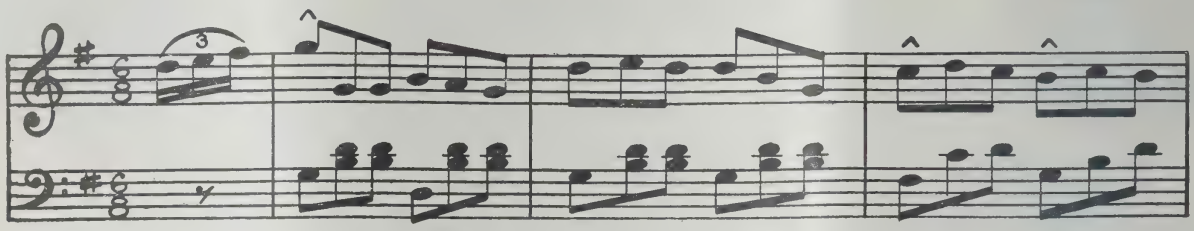
They join both hands, chasse down the inside of the set, and return to place.

Right arm to partner, all reel.....32 bars

The head couple link right arms, and turn once and a half around. The head lady then turns the next gentleman in line with the left arm once around, while her partner turns the next lady with his left. The head couple then turn each other once around, with right arms. The head couple turns the next couple with the left, then turns own partner with the right. This is continued until the head couple has turned each dancer in line, and has reached the foot of the set. There, they turn each other half around, so that each is on his respective side. They then join both hands, chasse up the center eight steps, to the head of the set. Both are now in their original places.

The idea is that the couple in reeling down the line from one side to the other, link arms and reel each other at each crossing from one side to the other. There will be five crossings, making ten contacts with the linked arms of the other dancers, and five contacts in the center of the set with one's own partner.

March.....16 bars



Execute a sharp "about face" toward foot of line. Ladies march to the right, gentlemen to the left. When the head couple reach the foot of the set, they stop, raise both hands, forming an arch, while the line makes an "about face" toward the head of the line, passing under the arch, up the center to the head.

NOTE.—The couple who started the dance are now at the foot of the set and, of course, foot couple. The new couple now at the head of the set begin the movements and each in turn, until the original couple is back at the head of the set, when the dance is finished. To reel, always turn your own partner with the right arm, and other couples with the left. To end the dance call,—All join hands forward, turn partners, promenade to seats.

# Friendly Houses—How to Build Them

## Some Useful Hints From One Who Has Studied the Subject

By ALBERT WOOD A. I. A.

HOW much help, if any, can an architect give you in the planning and building of your home? If you are one of the vast army who expect to embark on the great adventure of home-building in the spring, this question is doubtless giving you some concern.

You may engage an architect to prepare plans and specifications, and act as your adviser from the beginning to the end of the building program, or you may decide to proceed without an architect's services. In either case, there are a few fundamental things about the art of home-building that you should understand before you permit your ideas to take concrete form.

In the colonial period, and even when our grandfathers built homes, the problem was comparatively simple. The range of available materials was not great. The general style of architecture was more or less uniform in character. Workmen, maturing under an efficient apprentice system, were well trained in the more or less standardized system of design and construction, which we broadly characterize today as "Colonial."

Then, the general plan of the houses had much in common, and individuality was achieved by the varied treatment of such features as entrances, porches, fireplace mantels, stairways, and similar details, to which was added the inspired touch of well-trained craftsmen-architects.

In those days, a brick was a brick, and there were not forty different colors and textures to choose from. Windows and doors, gables and shutters, chimneys and cornices were all members of the same family, and worked harmoniously together to produce esthetic agreeableness and practical results.

For the prospective home-builder of today, the problem is far more complicated. The choice of first-class building materials is unlimited, as well as bewildering. The general style of architecture is no longer uniform, and craftsmen-architects have gone the way of the family doctor. With our varying climate, landscape, and topography, we have embraced the styles and periods of every civilized country. Our workmen are no longer self-sufficient craftsmen, able to produce beautiful detail without blue prints.

We are seeking individuality in the mass as well as in the detail of our houses—far beyond reason. There is a lack of modesty and restraint in our demands. We have developed an exaggerated sense of what constitutes the picturesque. We expect to assemble, in some ingenious manner, an unlimited assortment of requirements into one harmonious structure—all within the means of a limited purse.

We want everything that we have seen and fancied, and expect an architect to translate all this into terms of plans and specifications.

It should be expected, therefore, that during this process of translation, the "Castle" of one's dreams becomes in reality the "Cottage" of one's means. A room or two less in size, a few gables and a dormer trimmed off, a few unnecessary frills eliminated—your house may yet retain all the essential qualities of a truly fine home. In fact, this process of elimination—this recognition of quasi-necessary utilities is the means by which construction costs are reduced and greater definition given to the character and comfort a home symbolizes.

A picturesque composition in a "Colonial" type of house.

Thus, whether or not an architect is consulted, an elimination contest should be held. We might take as an example the motion picture producers, who cut ten thousand feet of exposed film to less than five thousand feet used to tell the story on the screen. Perhaps you have been thinking for a long time about this home-building adventure and have accumulated a vast store of ideas, some vital and good, many more or less conflicting or unnecessary, and *all* of them obviously impossible of realization in an average-sized home.

Few people know the relative value of the different rooms used in their own scheme of living. They would be astonished, if they had a fairly accurate record of the hours spent in each room, and this is most important in drafting a well-balanced plan.

By listing the space requirements in their proper sequence of importance, both the architect and the builder will be helped to determine essentials. If you find that more hours are spent in the kitchen than elsewhere, then the kitchen should be as good as any room in the house. Should you desire, above all else, a fine living room with a fireplace, and proper space for books, piano, and comfortable furniture, be prepared to make reasonable sacrifices, if necessary, to accomplish that end.

Do not use up the "great open spaces" by demanding numerous closets and storerooms, only to find you are left without one really livable room in the house. Closets usually cost more per square foot of floor space than rooms do, and in a well-planned house, closets do not occupy what would otherwise be just waste space, because there should be *no waste space*.

Regarding the choice of materials, do not insist upon all that appeals to you of brick, stone, stucco, half-timber, and shingles, being blended into one dazzling creation. There are, however, some interesting combinations of materials that produce great beauty when handled by an expert, but if your heart is set on having an odd, pictureque or quaint result (and you can afford to do it), instruct your architect to let his fancy have full play.

Better to decide on one material, if possible, or a suitable and simple combination, and stick to it in the interest of harmony and economy. A well-built home of wood is every bit as comfortable as one of masonry, so have the material you prefer. To build in "a workmanlike manner" is the important thing.

And when you at last move in and hang the crane, may you say, with Christopher Morley:

"Our little house is a friendly house,
It is not shy or vain;
It gossips with the talking trees,
And makes friends with the rain."

# Planning and Building

## Translating Fancies *into* Practical Results

*In illustration of Mr. Wood's article facing this page*

AN orderly style—simple, dignified and effective! Materials are not blended here to dazzle.

THE wall surfaces in this example are well-studied; developed from an orderly plan.

DOORWAY to a "friendly" house. Here interesting materials are well assembled.

THE style exemplified below breathes the spirit of "Colonial" America.

UNIV OF ILLINOIS
URBANA ILL
6-41

THERE are plenty of persons who have already made the assertion that they believe the American people have a short memory and that they intend to revive all the foreign associations which most directly interfere with the complete Americanization of our people.

Our principle in this matter should be absolutely simple. In the first place we should insist that if the immigrant who comes here in good faith becomes an American and assimilates himself to us he shall be treated on an exact equality with everyone else, for it is an outrage to discriminate against any such man because of creed or birthplace or origin.

But this predicated upon the man's becoming in very fact an American and nothing but an American. If he tries to keep segregated with men of his own origin and separated from the rest of America, then he isn't doing his part as an American.

There can be no divided allegiance here. Any man who says he is an American, but something else also, isn't an American at all. We have room for but one flag, the American flag, and this excludes the red flag, which symbolizes all wars against liberty and civilization, just as much as it excludes any foreign flag of a nation to which we are hostile.

We have room for but one language here, and that is the English language, for we intend to see that the crucible turns our people out as Americans, of American nationality, and not as dwellers in a polyglot boarding house; and we have room for but one soul loyalty, and this is a loyalty to the American people.

# THE ESSENCE OF THIS ISSUE:

Mr. Ford's Page this week discusses the industrial value of leisure as a factor in increasing the consumption of commodities.

*I see a thing and I report it!* This is Sinclair Lewis' secret formula for the writing of successful novels. He is a reporter by instinct, by training. That is all. But it is hard work, this transcribing of what one sees and hears and thinks. The thrill of success is largely counterbalanced by the struggle, the strain, yes the poverty, that go before. Dr. Stidger gives us another intimate account of the author of *Main Street*. (p. 2)

The gold that was Captain Kidd's—does it form the basis for the vast Astor fortune of today? An eminent authority on history declares that it does! Old records and old books tell of interesting dealings between John Jacob Astor, the fur trader, and one Jacques Cartier, who dwelled on Deer Island off the coast of Maine and whose pockets were always well filled with gold. (p. 8)

. Few men of the nineteenth century were read as widely as William Holmes McGuffey, who wrote such things as: "Here is a lit-tle boy. He has a new slate, given him by his fa-ther." Familiar? The words surely should be, for they are from the *New Second Eclectic Reader*, which you probably studied as a child. This is an engrossing story about Dr. McGuffey, compiler of the famous textbooks. (p. 16)

The storm of scandal long hovering over the Treasury Department has at last broken! Startling disclosures are made by the Congressional Committee which has been investigating the Bureau of Internal Revenue. Secrecy has enveloped most of the income tax rulings. Millions in taxes have been refunded or rebated *to corporations*. But there has been no rebate *to the farmer*! (p. 3)

Old? Why you're not old! Many of the greatest accomplishments the world has known have been done by men past the proverbial threescore years and ten. Don't mope about, thinking how *useless* you are; make yourself *useful!* Get a new interest in life—and stay young. This article tells you how. (p. 12)

And what is more natural than that a few vacation hours be utilized for the instruction of our children in religious matters? The disintegration of the home, the growing disregard for law, may be attributed directly to the lack of proper spiritual and moral training for the youth of the nation. Dr. Krumbine, originator of the famed Dayton Plan, gives an inspiring account of the purposes and results of the movement. (p. 21)

The Dawn City of America! Surely it is a phrase to fire the imagination. Twenty centuries ago in the heart of what is now the Nevada desert there lived a race that constructed houses (possibly the first on the continent) and built a city, six miles in length and one in width. It is a fascinating story, this of *Pueblo Perdido*—the Lost City. (p. 6)

The poorest movies often make the most money. Why? Because the public apparently likes to be misled by lurid titles and equivocal films. Producers, realizing this, cater to crass ignorance and to vanity. Reform within the picture industry itself seems distant. Organized effort on the part of the patrons is needed. (p. 5)

Why did Bryan oppose the Darwinian theory of evolution so vigorously? Why did he brave the storm of sarcasm and ridicule that was bound to result? His enemies accused him of seizing the issue to keep himself in the limelight, but this accusation was hardly fair or just. Rather, some inner monitor always was urging him forward, Mr. Schermerhorn declares in the last installment of his lucid, interpretive articles on the Commoner. (p. 14)

In these days of airplanes and radio, of automobiles and motion pictures, it is well to pause once in a while in remembrance of another age when life was more leisurely and more neighborly—the age of "bees." They were truly American, these "bees," when men and women gathered from miles around to share their pleasures and their harder tasks. Here is a delightful tale of an old-time quilting bee. (p. 32)

Sun shining on the bare limbs of forest trees. Snow in patches under the evergreens. The chattering of squirrels punctuated by the staccato drumming of the downy woodpecker. The drip, drip of maple sap falling in buckets. And the sweet odor of the boiling syrup! If you would feel the thrill of the sugar camp, read this story of spring in the north woods. (p. 20)

It is a rare treat we have for our readers: a new tale by Charles J. Finger. It deals with Magellan and his trip around the world—*The Voyage of the Victoria*. Many new things are related: how a firm of keen merchants and not the King of Spain financed the trip; the fanaticism of Magellan, who had little of human kindness; the part that Barthema played. The first chapter will appear in an early issue.

SUBSCRIPTION PRICE $1.50 A YEAR in the United States and its dependencies, also Canada, Cuba, Mexico and countries where the United States Domestic Postage Rate applies; other foreign countries, $2.00 a year. Single copy, ten cents.

CHANGE OF ADDRESS. 1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.
Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879.

# How I Write and Why I Write

## Sinclair Lewis Talks of His Methods in the Making of Some of His Books

By WILLIAM L. STIDGER

"WHAT few people understand about an author's life, even a man who writes a successful novel," said Sinclair Lewis one evening as we sat by the wood fire, swapping opinions, "is that period in the novelist's life which is filled with poverty, struggle and strain, before the highly successful novel puts him in that greatly desired position where he can thumb his nose at the world.

"Neither do they understand that period of unutterable depression which follows immediately the strain of writing a novel.

"I thought of *Main Street* for fifteen years. It came to me in my junior year at Yale, during a vacation back in Sauk Center. It was a tedious vacation. I had gone duck hunting, prairie chicken hunting. I had mowed the lawn. I had gone to the soda fountain. I had taken in the usual parties, if there were any. I was bored. Then I got to studying. The idea of the book came to me.

"First I wanted to call it *The Village Virus*. It was my original intention to picture a young lawyer settling in this little town, with high ambitions and ideals. Then after a few years he is going about the village with a two days' beard, and dirty linen; often with his coat off and his suspenders flapping. Then, before he knows it, the Village Virus has got him.

"That was originally to be the name of *Main Street*. I am glad that somebody saved the book from that name.

"The years, after the conception of the idea of the book, sped on. I did a lot of newspaper work. I was an editor, a publisher's reader, and an advertising man. I traveled, and got married, and all the time that Village Virus was working around inside until September of 1919. Between September of 1919 and October of 1920 I wrote the idea into a book called *Main Street*."

"Had you written other books in the meantime?"

"Several. But all of the time I was brooding over that Village Virus idea," said Sinclair Lewis.

"How did you actually write it?"

"I said to Gracie, my wife, 'The time for *Main Street* has come. It's now or never! If I write it I am going to offend some of the editors who have been accepting my short stories. The book will make me a world of enemies. It will not sell more than fifteen thousand, if it even sells that.' "

"You didn't expect it to sell very well, then?"

"I certainly didn't. None of us expected it to sell, not even Mr. Harcourt, the publisher.

"But Gracie was a good sport and agreed that I should go ahead. We had the baby, Wells (named for H. G. Wells), and a few thousand dollars which we had saved from my short stories. It took, as I have said, nearly a year to write the book. When I got through I was broke.

I had to borrow five hundred dollars from my doctor father out in Main Street, Minnesota. He sent it. He didn't even say, 'There I told you so. Why don't you quit the writing game and do something practical, something that will make you a living?' No, he just sent the check without a word of either advice, regrets, or caution. I love him for that. Then I had to borrow another five hundred. The book was not going. I was tired out physically.

I was sapped. I was blue. I wrote a story for *The Saturday Evening Post*. It was no good and Lorimer sent it back. That made it worse. I thought that I was through with the writing game, I felt as if I was no good and could never do another piece of work. You see I had worked night and day for at least eight months. It usually takes me two years to write a novel. I did this one in eight months. I'll never drive myself that way again.

"I sent the rejected story to *Harper's* and they bought it—God bless 'em. They saved my courage and they kept me out of jail! I wrote another and both the *Post* and *Harper's* turned it down. It went out four times and finally landed. I was desperate. I was broke again, for my borrowed thousand didn't last long in New York City. The book had not, as yet, begun to sell in any unusual way.

"Such periods of depression in the life of a writer seldom interest people. They think that a successful author's life is all a bed of roses. They think of him as riding in limousines all his days, from infancy on. They see him jaunting about with chauffeurs, butlers, haughty maids, drinking champagne and doing society. They never think of him as a hard-working craftsman with a wife and child to support.

"Then *Main Street* began to go and the problems were partly solved. No, not entirely, for there was the next novel to think about, and to wonder about—to wonder whether one could ever write another, and, if so, could one keep even his present standard up—but all of it hazy and uncertain."

"Just what gave *Main Street* its phenomenal sale?" I asked Mr. Lewis, feeling that this was a question that all of us embryo Main Street authors would like to ask.

"I have a theory which I think is correct. You see, we had just been in the war. Thousands of our Main Street boys had been away for the first time from Main Street. In fact they had gone clear to France and England. Much to their surprise they found the French, instead of being a lot of 'frogs,' were educated and cultured. They found English 'Tommies' who were Oxonians and read Greek in the mud holes. That gave the Main Street boy a great deal of respect for the 'Tommy.' That boy learned that there was a world that Main Street didn't realize existed. He became humble. He became introspective and self-critical. He was willing to admit

(Concluded on page 25)

# Government Loses Tax Millions

## Some of the Facts Disclosed by the Select Committee's Report to Congress

By CHARLES B. BREWER

An astounding report has been returned to Congress by the Select Committee, which was authorized in March, 1924, to investigate the Bureau of Internal Revenue. The work was threefold, comprising: (1) The administration of the prohibition laws; (2) a statistical investigation to ascertain the cause of the marked year-to-year variation in taxable income; and (3) the administration of the income and estates tax. The Committee declares:

"There has been *gross discrimination* in arbitrarily allowing amortization for reduced postwar cost of replacement in some cases and in denying it in others similarly situated . . .

"Mr. Greenidge (head of the engineering division of the Income Tax Unit) appears to be *ill informed* as to the work under his jurisdiction, *incompetent*, and *generally unfit* for any position in the Government service requiring the exercise of engineering ability and sound discretion.

"There appears to be a growing tendency by authorities superior to the appraisal section chiefs to make a production record *regardless of principle* and to give *persistent and influential taxpayers* anything required to reach a settlement . . .

"All amortization allowances exceeding $500,000 have been reviewed by the Committee's staff *and improper allowances in this class alone appear to amount to $210,665,360.40. The tax on about two-thirds of this amount can be saved to the Government by prompt action of Congress.*" (The above italics are ours.)

MOST of the abuses which occur in tax matters are made possible by the deep secrecy which covers all tax actions. Whose purpose does secrecy serve?

The Senate Committee investigating tax matters showed that *secrecy as to names and amounts was inconsequential* as compared with *other forms which secrecy has taken.* The report of this Committee showed:

a. That five-sixths of the 20,311 rulings applicable to income taxes are kept secret; (pp. 7 & 237)*

b. That rulings settling cases were unavailable as precedents even to those who should apply them;

c. That gross discrimination in applying principles differently to similar cases was prevalent; (pp. 7 & 144)

d. That failure of taxpayers to claim what was rightfully their exemptions followed; (p. 7)

e. That taxpayers were thus forced to engage former employes of the Department to get what the law intended should naturally be every citizen's right; (p. 237)

f. That the effect was to place a premium on the services of ex-employes who artificially profited thereby; (p. 7)

g. That the filing of claims, which grew between March, 1924, to March, 1925, from over 93,000 to over 254,000, was another of the inevitable results. (p. 239)

***Importance of Accuracy in Tax Data***

If precise information ever was necessary to people or firms whose financial interests are vitally affected, it is on income tax requirements. There is scarcely a subject, however, upon which there is a greater diversity of opinion. In what is probably as intricate a piece of legislation as was ever enacted and as to which there was a crying need from the public for advice, it is found that dissimilarity of interpretation seems to have been the rule. Forming, as it does, an important part of the greatest financial undertaking in the history of the world, a slight difference in interpretation of a single item in a single account often means millions of dollars. Who passes on such questions? The report says:

"Discretionary power vested in the Commissioner is actually exercised by division heads . . . governed by no adequate rules or instructions" (p. 6) with "almost unlimited discretion to be secretly exercised." (p. 8)

What happens may be seen by following a single subject—amortization; which means, briefly, plant and equipment added for war purposes after April 6, 1917, the usefulness of which ended or was diminished when the war ended and for which the law permitted a decrease in tax. Actual cases of interpretations at different times show:

| | |
|---|---|
| *One account,* | |
| Originally claimed | $ 659,000.00 |
| Finally claimed | 10,924,025.52 |
| Finally allowed | 8,912,879.00 |
| *Another account,* | |
| Originally claimed in 1919 | $ 6,852,697.36 |
| Claimed after November, 1921 | 18,268,435.82 |
| Finally allowed | 15,589,614.39 |

The totals of all accounts listed (which includes those above a half-million dollars only) show these are not exceptions.

The total originally claimed was $331,527,046.18.

The total finally allowed was $425,-921,945.92. (pp. 176-179)

***Deductions Allowed For Amortization***

Yet the Senate Committee reported that $117,-000,000.00 of this *was outlawed* (p. 183) and "improper allowances in this class alone appear to amount to $210,665,360.40" (p. 4) and, also that "There has been *gross discrimination* in arbitrarily allowing amortization for reduced postwar cost of replacement *in some cases and denying it in others similarly situated*" (italics are ours). (p. 5) That is the charge: *different* rulings on the *same* things.

Though the law provides for a "reasonable" deduction to be allowed for amortization and the Treasury has to decide what *is* reasonable, yet such was the passion for secrecy that on this subject the report states:

"*The Solicitors' ruling in this case, published on October 26, 1925, . . . constitutes the first official statement of the principles which are to govern the determination of amortization allowances ever promulgated by the Bureau of Internal Revenue.*" (*p. 150*) (Italics per report.)

And, more to the point, the Committee stated that this date of October 26, 1925, was:

"*A year and eight months after the close of the period within which amortization allowances could be re-determined.*" (*p. 150*) (Italics per report.)

This secrecy does not concern income tax *returns.*

It concerns the *rules* by which returns must be judged.

This is not a matter of divulging private affairs. It is natural that even those with nothing to conceal should shrink from indiscriminate publication of their private affairs such as the law is written to protect. But it is impossible to conceive what legitimate reason should exist for so withholding from those persons and firms *the rules which will determine how deeply they must dig into their pockets.* The people pay this tax. It is their sovereign right to know how much they must pay and that all shall be treated alike.

***Why Are Rules Withheld From Taxpayers?***

---

*The minority report states 4,500 rulings were published. This would mean only ¾ were secret. It adds:

"The bulletins in which rulings are published have contained for the last two years a statement on their covers as follows:

" 'No unpublished ruling or decision will be cited or relied upon by any officer or employe of the Bureau of Internal Revenue as a precedent in the disposition of other cases.'

"Surely everything possible has been done by the bureau to insure the publication of rulings and *to prohibit the settlement of cases in accordance with any ruling not published.*" (*Minority Report p. 20, Cong. Record, 2-6-26, p. 3122.*)

Just what this means except to emphasize how secrecy and not discrimination was encouraged is not clear.

Here are instances of dissimilar treatment of similar cases. On pages 185-189 of the Senate report it is stated:

For one firm, $9,913,841.86 tax and *penalty for fraud* was compromised for $2,631,381.81. (p. 185)

For another firm, $1,546,341.03 *another penalty for fraud* was compromised for $310,000.00. (p. 189)

For another $1,888,828.29 *another penalty for fraud* was compromised for $100,000.00. (p. 192)

Information as to the first reached the Treasury through an anonymous communication and led to the discovery (p. 185) by checking of accounts. As to this matter the Committee further states:

> "Notwithstanding the fact that this tax was assessed upon *fraudulently concealed* income, it was compromised upon the taxpayer's *unverified* statement as to his ability to pay," (p. 187) (Italics are ours.)

***Ninety Per Cent of Penalties Are Compromised***

and further shows whether or not the "unverified statement" was correct by adding:

> "the stockholders were left with a property which had a market value of $4,113,730.50 at the time the compromise was effected and which now has a market value of $16,303,544.25." (p. 190) . . .
>
> "Deliberately compromising taxes for less than can be collected is an abuse of discretion . . . This, the Attorney-General has said, the commissioner is not authorized to do," (p. 190)

yet, "*Ninety per cent of the fraud penalties are compromised,*" says the report. (p. 192)

In addition to the "refunds" of $151,000,000.00 *allowed* in 1925 and recently published, the total refunds (says the report, page 193) amounted to $459,090,825.49 from beginning of fiscal year 1921 to April 30, 1925, and there are many other "*credits,*" "*abatements*" and "*allowances*" *for amortization* and *for invested capital and so forth* where discretion must be applied which do not enter into these figures because of settlement before such amounts are arrived at.

A taxpayer, therefore, when told by the Senate Committee that the huge sum of $459,090,825.49 has been "refunded" has an idea of the amount of discretion which may be applied in such matters though it is a small measure of such discretion when the full report is studied. It is many times the size, however, of such measure as would be guessed at from a perusal of the annual report of the Secretary of the Treasury. In this refunds are referred to as follows:

***Refunding of Taxes Illegally Collected***

> "In the foregoing statement of receipts no deductions have been made on account of refunds, which for the fiscal year 1923 were as follows:

| | |
|---|---|
| Refunded taxes illegally collected, claims prior to July 1, 1920 | $71,980,947.24 |
| Refunded taxes illegally collected, 1921 | 34 502,757.76 |
| Refunded taxes illegally collected, 1922 | 14,784,563.07 |
| Refunded taxes illegally collected, 1923 | 2,724,552.87 |
| Total refunds | 123,992,820.94" |

(*Secretary of Treas'y Report for 1923, p. 431*)

It is to be hoped that any taxpayer who derived satisfaction in December, 1923, from being told that so many old debts for "1923," "1922," "1921" and "claims prior to July 1, 1920," had been paid off, did not see the next year's report of the Secretary for there he would have seen:

> "In the foregoing statement of receipts no deductions have been made on account of refunds, which for the fiscal year 1924 were as follows:

| | |
|---|---|
| Refunding taxes illegally collected, 1920 and prior years | $29,244,233.15 |
| Refunding taxes illegally collected, 1921 | 11,854,300.19 |
| Refunding taxes illegally collected, 1922 | 7,772,246.91 |
| Refunding taxes illegally collected, 1923 | 4,476,790.98 |
| Refunding taxes illegally collected, 1924 and prior years | 83,658,654.42 |
| Total refunds | 137,006,225.65" |

(*Secretary of Treas'y Report for 1924, p. 237*)

Information is lacking as to difference in meaning of years *prior* to 1924 as *tabulated* and "1924 and *prior years*" and as to the necessity for refunds in "1920 and *prior years*" and also refunds in "1924 and *prior years*" since all *prior* years are given. If, however, the taxpayer saw the two reports and had his satisfaction changed to disappointment, his disappointment was doubtless changed to concern last December when another report was as follows:

> "In the foregoing statement of receipts no deductions have been made on account of refunds, which during the fiscal year 1925 were made from the following appropriations:

| | |
|---|---|
| Refunding taxes illegally collected, claims accrued prior to July 1, 1920 | 452,934.42 |
| Refunding taxes illegally collected, 1924 and prior years (2) | 49,209,535.60 |
| Refunding taxes illegally collected, 1925 and prior years | 11,945,475.98 |
| Refunding taxes illegally collected, 1926 and prior years | 90,301,391.33 |
| Total | 151,909,337.33" |

"(2) Includes $17,777,642.45 refunded as a 25% reduction under provision of section 1200, revenue act of 1924."

(*Secretary of Treas'y Report for 1925, pp. 375, 376*)

The Senate Committee must be correct in the statement that from March, 1924, to March, 1925, progress in a backward direction was shown by an increase in "Returns five years old or older" from 29,576 in 1924 to 31,669 in 1925 and in "Returns three years old" from 93,955 to 254,352 in the same year. (p. 239) The same Senate Committee also stated, "The unsatisfactory conditions developed by this investigation are the inevitable result of delegation of almost *unlimited discretion to be secretly exercised.*" (p. 238) (The italics are ours.) The Committee also expressed the opinion that but few of the "unsound settlements" would have been made "*if it were not for the belief that they would never become public.*" (Again our italics.)

***Publicity Would Have Armed the Farmer***

*Publicity Would Have Armed the Farmer and Others With Valuable Information Seemingly Unknown Even to the Solicitor.*

It has been remarked above that "amortization" formed an allowance for plant and equipment acquired for war purposes. "Whether *land* is a proper subject for amortization under this act may be a debatable subject," said the Committee. (p. 145) The Committee report stated, however (p. 144), "When asked if amortization *could be* applied to land, Mr. Gregg, solicitor for the bureau, answered as follows:

" 'No, sir; we have ruled specifically that it does not apply to land (p. 3185).' " The report then gives the names of five (5) firms where it was "*admitted* before the Committee *that it had been applied to land* and gives the names of sixteen large corporations *where it had also been applied* and these were named as a limited class where such allowance was over $500,000 in each case. (p. 144)

The question *was* ruled on, as remarked by the solicitor, but it was *not consistently ruled on* as he stated it was; for the Committee report states "numerous cases are noted where amortization on land is *denied*," notably in the case of a large concern where it was denied although the *appraisal showed evidence of a loss.* (p. 145)

***There Was No Rebate to the Farmer***

The report referred to this inconsistency of ruling as "the worst kind of discrimination" and added:

> "Millions of dollars have been lost by farmers who purchased lands at inflated war values, but, with the exception of two large sugar companies, no allowances upon farm land have come to the attention of the Committee's staff." (p. 145)

There was no rebate to the farmer.

The importance of such allowances is shown by a tabulation aggregating a value of $425,921,945.92 of such as were examined by the Committee's staff. (p. 146) Over $65,000,000 of *one* class, says the report, were " 'purely tentative' and inaccurate" (p. 148) and though the basis of every large allowance theretofore made was condemned by the first authoritative ruling on *another* class, no redetermination was ever attempted—not even for the case ruled on. In fact, the period for redetermination was allowed to expire before the ruling was published. (p. 149)

In one of these cases the Committee's staff took exception to items which involved a (*Concluded on page 23*)

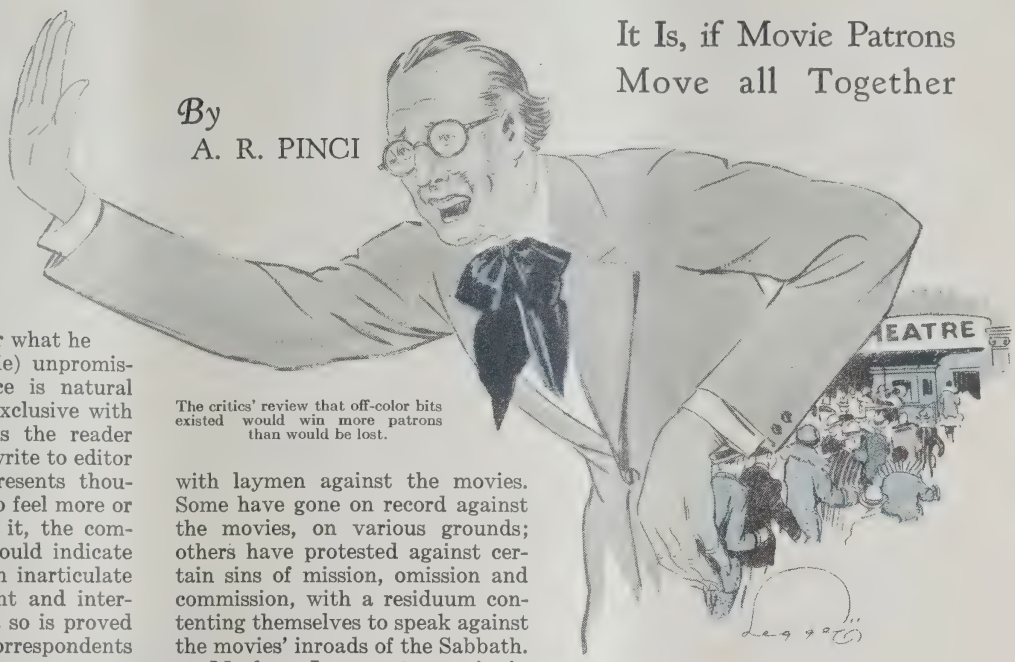
# Is a Movie Renaissance Possible?

## It Is, if Movie Patrons Move all Together

By A. R. PINCI

WHEN one of several DEARBORN INDEPENDENT readers, who have been good enough to write me their comments about the present-day motion picture situation, which recently appeared in these columns, pointedly requests a remedy for what he terms "the present (movie) unpromising plight," the inference is natural that the problem is not exclusive with the writer. Inasmuch as the reader who takes the trouble to write to editor or contributor often represents thousands of other readers who feel more or less the same way about it, the communications I received would indicate that I have spoken for an inarticulate but nevertheless intelligent and interested group. That this is so is proved by the fact that my correspondents have agreed with me.

One communication most difficult to answer calls forth additional observations. Its writer is Roscoe Carpenter, vice-president of the Twentieth Century Motion Picture and Dramatic Clubs, Incorporated, with national headquarters in Indianapolis. After saying that he believes all that the articles said, Mr. Carpenter adds in part:



"I am left to wonder if anyone who calls attention to this fact has in mind an intelligent and tangible remedy. The thing that is of moment importance to me is a remedy for such a condition. The present producers and distributors of motion pictures no doubt have a reason and purpose in exploiting such pictures. It may be merely money, but in many instances, I am inclined to believe it is more than money."

***The Remedy Exists Collectively***

Mr. Carpenter, in his official rôle, requests information about a remedy, if such exists, and even hopes that the writer is "in position to do something to cause motion pictures to become the great medium for teaching and inspiring the people."

Since the briefest answer is the best, be it said here and now that the remedy is not in the possession of any one person or group of persons. It exists, but it exists collectively, through the majority of the motion picture adherents, if and when they act together. In other words, while we admit its existence, we must dismiss its practicability. Keeping the majority of the American movie-going public herded together long enough to effect a corrective strike or boycott is impossible.

Occasionally churchmen have joined with laymen against the movies. Some have gone on record against the movies, on various grounds; others have protested against certain sins of mission, omission and commission, with a residuum contenting themselves to speak against the movies' inroads of the Sabbath.

The critics' review that off-color bits existed would win more patrons than would be lost.

Much as I regret to say it, in my experience I have found that the average churchman's objection is dryly dismissed on suspicion of its sometimes assumed but sometimes ultraobvious selfish motive. When the average churchman berates the movies or moviedom, the reaction in most cases is, vernacularly, "that somebody is always taking the joy outa life." And if churchmen, who have the advantage of addressing simultaneously their parishioners, fail to convince the latter of moviedom's shortcomings, what chance is there for any one else to do so?

The newspapers?

The newspapers have their responsibility to the public, of course, but their influence is not so absolute that they could do anything about the matter. If the public hits upon a remedy against ridiculous and sensational supermoviedom the newspapers will propagate it, so long as it is news. Newspapers could begin tomorrow to reproach the motion picture industry for its chief product, but would that keep patrons away from their favorite movie houses, hero or heroine, or title? "The Fourth Estate," in this instance, is no match for the fifth, if it is true that our movies have become the people's fifth estate.

***Where the "Fourth Estate" Falls Down***

Editors are to blame in many cases, however, where they have established the so-called movie criticisms. Few newspapers indeed make any pretense to criticize the first releases as they come to town. There is a distinction, of course, between "reviewers" and "critics," and a review is not a criticism. Of the critics who criticize the movies professionally, not one in a hundred is competent to do the job reasonably well. If he or she is, none except a very rich newspaper could afford to pay for such service. A few magazines, like *Life*, *Judge*, and *The New Yorker*, are contributing some outstanding analyses week in and week out, but what does the average moviegoer care about them?

It will be remembered that *Life*, a dozen or so years ago, found that the reviewing privilege was denied to Metcalfe because he really critized. Producers and others went out of their way to prevent the publication from even buying seats after the reviewer's seating privilege had been suspended. The rumpus went through the New York courts. Nevertheless, the bad and rotten shows kept on appearing; the only effective test was the box office.

***Bad and Rotten Shows Kept on Appearing***

Unlike any other nation in the world, the United States has no love for the critic, no matter what may be under criticism. Multitudinous reasons render American groups oversensitive to it and they resent it; all the more if it is called for. If magazines and newspapers fail to be aggressive in this field it does not mean that business reasons are the cause. If readers did not object, it would not affect the income or standing of any periodical to be freely critical. So long as most readers will not grant the editor the right to denude fraud and bunk—a right which the reader exercises individually without restraint—the press cannot and will not be useful in the matter.

Situation of one of several communal houses excavated in the "Pueblo Grande" in Nevada. This house stood on a mesa between a one-time river and a row of hills. It had three fire-holes for cooking and several outbuildings. Numerals indicate the order in which rooms were excavated. Work conducted by Museum of the American Indian, Heye Foundation.

# Perhaps the First of American Cities

## A Long-Lost Pueblo of Nevada Where Americans May Have First Built Houses

By JOHN SLOAN

THINLY covered by shifting sands and rolling fragments of rock, the ruins of a city about six miles long by one mile wide are being excavated on the eastern bank of the Muddy River, in Southern Nevada. Investigations so far carried on—and being continued—indicate that this is the oldest city in America north of Mexico. It is quite within the realm of possibility that it is the first of all cities built in the New World, though there are ruins in what was once the Maya Empire, in far Southern Mexico, which may have antedated this community buried in the barren desert of the West.

Here in this valley, at least two thousand years ago, lived a people who had learned to make pottery, round it and paint it; to raise corn and squashes and cotton; to weave cloth from that cotton; to make vegetable dyes and color their cotton cloth; and, possibly most important of all, *to build houses of more than one room.* From it went southward those still-living tribes known as the Pueblo Indians, whose ancestors, in this *Pueblo Perdido de Nevada*—literally, "the lost city of the land of snow"—had learned how to construct permanent homes, and had begun to appreciate that the gathering together of a tribe in one settlement produced not only greater safety, but greater advancement in comfort, and greater security of food supply.

Perhaps, from this Mother City went southward the remote ancestors of the Maya, who became, between 1000 B. C. and A. D. 600, the Greeks of the New World. Perhaps, in this long-lost pueblo of Nevada was evolved for the first time in the Americas the art of house-building, crude at the beginning, but to be developed later into the communal homes of the Mòki and the Hopi and the other Pueblo tribes, and, possibly, into the palaces of Chichen-Itza and Palenque and Mitla. These things we do not know, but it is certain that this Lost City of Nevada was built and flourished and fell to ruin long before men had built similar towns in any other part of what in now the United States. Without much doubt, this settlement antedates by hundreds of years the mysterious cliff dwellings and the interesting clay and stone communal houses of New Mexico and Arizona.

The Nevada ruin which stretches along the east bank of the Muddy River, from a point opposite the Mormon town of St. Thomas to Overton, has been known to prospectors, Indians and farmers in this section for many years, but it was not until the summer of 1924 that a detailed description of the surface appearance of the low walls, shards of pottery, and external evidences of graves was given to Governor J. G. Scrugham, of Nevada, by John and Fay Perkins, brothers, prospectors in the Muddy River region. The governor reported the discoveries to the Museum of the American Indian, Heye Foundation, and M. R. Harrington, archeologist of that institution, led an expedition to the excavation the *Pueblo Perdido* in the late autun of 1924. The results have been a tounding, second only in importance American archeology and ethnology those discoveries made by the Dohe Expedition to Hava Supai Cañ Arizona, last winter, described in the columns a short time ago. The wo of exploration was suspended duri the summer months, but it is believ that only the surface has be scratched, and that more valuable d coveries than any yet made will rewa the investigators.

So far, about fifty houses have be excavated, out of hundreds in the ar of six square miles covered by the cit Ruins of many more structures we destroyed by cultivation by presen day farmers outside the present limi of the Lost City, so that at one time probably covered an area of not le than ten or twelve square miles co parable with a community of 30,000 40,000 inhabitants today. Houses the Lost City, however, are not clo together, as in a modern city, but a scattered, so that this community pro ably never held more than eight or t thousand persons in its most populo and prosperous days. The houses ran from one or two rooms to one of twent one rooms, all one story, built of cru bricks of sun-dried mud, possibly t earliest form of the adobe still used b the poorer classes of Mexico in buildi their homes. During the twenty ce turies or more that have elapsed sin the Lost City fell to ruin, these wal

have been eroded and washed away, until nothing remains to mark each house but a pile of mud, mixed with rocks. A few fragments of walls, preserved beneath drifted sand, remain standing, but these are exceptions.

More interesting than these walled houses, however, are the pit-houses, found in certain sections of the *Pueblo Perdido*, and in themselves showing the great age of the ruin. Among the earliest habitations of man in Asia—whence it is believed that man came to the Americas by way of Bering Strait—are pits dug in the ground, and roofed over with brush and sticks built into the shape of an inverted V, or a half-circle. Houses of this kind have been found in the Lost City. In other words, in this one primitive community have been found not only the earliest type of *constructed* habitations of man, but also the second and third steps in house-building, the second being the erection of four joined walls to the height of a man's head, and the third the putting together of two rooms so that one wall forms a partition between them. These factors in house construction had been known for centuries when the Pueblos built their communal cities in New Mexico and Arizona, and quite apparently the ancestors of these Pueblos developed these methods in *El Pueblo Perdido de Nevada.*

The pit-houses are worth a moment's consideration. As excavated in this dawn-city of America, they consisted of oval pits dug to a depth of two or three feet, eight to ten feet long and six to eight feet in their greatest width. They were floored with adobe and the sides of the pit smoothly walled with the same material. From the ground upward, the sides and roof of these most primitive of permanent houses were made of wattled brush, crude matting, or small saplings stood close together for walls, and laid similarly closely for the roof, not unlike the *ramadas*, or brush inclosures, set up as shaded places of rest near the adobe houses of present-day Mexican Indians. That these pit-dwellings in the Lost City had no permanent walls is indicated by the fact that the pits so far excavated have contained no stones or fragments of baked clay, being filled with drifted sand and the brush, of course, has long since perished.

In between the pit-dwellings and the more pretentious walled and roofed houses of the *Pueblo Perdido*, appears an intermediary type of building, which starts with the pit, but has an encircling wall of adobe, or adobe and stone, apparently once roofed with brush or saplings. In these improved pit-houses, the walls have fallen into the pit, but the roofing has disappeared. Probably the development of the house of more than one room was a direct outgrowth—right here in the Lost City—of these pit-dwellings. Some prehistoric builder, erecting his own home, discovered, probably by accident, that if he placed the pits close together, and made them square-cornered instead of oval, he could use one common partition wall for two adjoining houses, and, at the same time, obtain greater solidity for both structures. From this discovery—comparable in importance with modern man's development of the skyscraper—came the single house containing a number of rooms, and, later, the two or three storied communal building of the Pueblo Indians, long after their ancestors had left the mother community of the *Pueblo Perdido.* Probably several centuries elapsed during which man in America was content with the one-story house of several rooms, before he evolved the idea of piling one story on another to obtain more house room on the same ground area—but the fact remains that his first idea of a *permanent home* in a *(Concluded on page 31)*

Circle—One of a large number of well-preserved skeletons, buried 2,000 years ago or more, with pots of food and primitive treasure, in Nevada's Lost City. Below—One house of the Lost City, showing some of the pre-Pueblo architecture and the method of excavating.

# Is Astor Fortune Founded on Captain Kidd's Gold?

## Dr. Bolton, of the University of California, Tells Strange Story of a Lonely Cave and Buried Treasure

By H. H. DUNN

MAINTAINING that history is sometimes stranger than fiction, Dr. Herbert E. Bolton, chairman of the history department of the University of California and dean of the magnificent Bancroft Library there, rises from his seat as one of the premier historians of the world to say that there is no use to hunt for the treasure of Captain Kidd, and adds that, as a matter of fact, there has been no use to hunt for it for nearly two centuries, because, away back at the end of the seventeenth century, it was found, and became the basis of the Astor fortune of today.

Ever since men became interested in the piles of gold established by other men in the New World, it has been believed that John Jacob Astor laid the foundations of his particular pile on the skins of little animals, trapped and sold for the protection and beautification of the leading ladies of the world. We have read for years of the hardships suffered by this brave and daring pursuer of pelts, apparently inspired with the sole motive that his descendants should own most of Manhattan Isle, and have plenty of time to play tennis. Comes now, however, Dr. Bolton, with an armful of proof, and a cynical smile to show us that the Astor fortune came out of an iron-bound oaken chest, filled with doubloons, pieces of eight, sets of plate and other valuable things, all looted by Captain Kidd from Dutch, Spanish, French and English merchantmen whose high prows he crossed with most influential solid shot.

"Some time ago," said Dr. Bolton, after I had climbed four flights of marble stairs to find him completely surrounded with ancient Spanish documents in the heart of the Bancroft Library, at Berkeley, "the Olmstead family came into possession of Deer Island, off the coast of Maine, by purchase from an Indian chief. Some years later, a descendant of this same family erected a summer home on this island, and there Frederic Olmstead spent the summer of 1893. He sailed, fished, and entertained his friends, as a wealthy and socially inclined man will do, and the summer would have passed as an incidental to American history had not the inquisitive Frederic found a cave on one of his rambles about the island.

"Entrance to this cave was visible only at low water; the flood tide covering its entrance, but a combination of ebb tide and Olmstead at the same point and at the same time revealed a cross, nearly the size of a man standing erect with arms outstretched, cut deeply into the outer wall of the cavern, and visible only at the lowest point of the receding waters. At the foot of this cross, Olmstead, being a man of muscle as well as of means, dug, until he came to a square pit in the stone floor of the cave beneath the layer of mud and sand put there by the sea. Marks made by the heads of bolts and by iron-bound corners showed that a tight-fitting chest once had been driven into this rectangular bed, which apparently had been carved a trifle too small for the box it was intended to receive.

"His interest aroused, Olmstead turned to the historic documents concerning Deer Island, and found from them that more than 90 years before, one Jacques Cartier, a trapper and hunter, had lived on the island; that he periodically visited the settlements of the mainland, his pockets well filled with gold, which he soon exchanged for the strongest liquid refreshment the times and the taverns could supply.

"When Cartier had reached a certain point in his celebrations, he invariably attempted to purchase either all of Deer Island, or that part of it on which his cabin and this cave were located. Eventually, he succeeded in buying, with current gold, the latter section. The trapper, then well along in years, also let fall a few remarks which led to further questioning as to the source of his funds.

"So interesting were these remarks that some of them were written into the documents which accompanied the papers of title to the island long prior to the passage of these papers into the hands of the Olmstead family. Curiosity so aroused led Frederic and other members of the Olmstead group to the ruins of Cartier's cabin, which then remained on the island. There, in the rubbish left by the trapper, was found a scrap of paper, on which, written in cuttlefish ink, and still legible, were the words 'Absolute secrecy must be maintained—John Jacob Astor.'

"Olmstead then went to New York, with the idea that the records of the first Astor's financial transactions might throw some light on the cave, as well as on Cartier's periodic rises to prosperity. There Olm-

# MR. FORD'S PAGE

THE economic value of leisure is an idea which has not found its way into the thought of industrial leaders to any great extent. While the old idea of "lost time" has departed, and it is no longer believed that reduction of the labor day from twelve hours to eight hours has decreased production, still the positive industrial value—the dollars and cents value, if you will—of leisure, is not understood.

It will be borne in mind, of course, that the statements made above regarding "lost time" mostly relate to our own country. They are by no means true of all other countries. The hours of the labor day were increased in Germany under the delusion that thus the production was being increased. It was quite possibly being decreased. With the decrease of the length of the working day in the United States an increase of production has come, because better methods of disposing of men's time were accompanied by better methods of disposing of their energy, and thus one good thing brought on another.

These angles are quite familiar. There is another angle, however, which is destined to come more and more to the fore, namely, the positive industrial value of leisure to industry because it increases consumption.

It will require no argument to show that where people work longest and with least leisure, they buy less goods. No towns were so poor as those of England where the people, from children up, worked fifteen and sixteen hours a day. They were poor because people who are thus worked become less and less valuable as workers, and therefore earn less and less, and therefore buy less and less. They were poor because people who worked such inhuman hours had no time to cultivate needs, even if they had time and money to fulfil them.

Now business is the exchange of goods, the more easily and plentifully made, the more conducive to general prosperity. And goods have their vogue only as they meet needs. And needs are filled only as they are felt. And they make themselves felt largely in leisure hours. The man who worked fifteen and sixteen hours a day desired only a corner to lie in and a hunk of food. He had no time to cultivate new needs. No industry could ever be built up by filling his needs, because he had none but the most primitive.

*THE industrial value of leisure as a promoter of the consumption of goods, and thus as a stimulant to business, has been proved. People who have more leisure must have more clothes. They must have a greater variety of food, more transportation, more service of various other kinds. If we should come to a five-day week the result would be beneficial to industry and commerce. Instead of business being slowed up because the people were "off work," it would be speeded up because they would consume more in their leisure than in their working time.*

Business has grown as a direct result of the growth of the people's margin of leisure, because it is in their leisure hours that the people's minds expand and their sense of a fuller life grows strong. Think how restricted business is in lands where men and women both work all day long, from dawn to dark, even in this present time. They have no time to let the needs of their lives be felt. They have no leisure to buy. They do not expand.

When, under the benign influences of American industry, women were released from work, and became the wives at home, the buyers for the family, how business expanded, and how the American home became enriched. We owe a great part of that to the leisure of our women, who were thus given time to sense the further needs and to go out and find the merchant or manufacturer who was supplying them. The American Wife, as household purchasing agent, has both leisure and money, and the first has been just as important as the second in the development of American business.

If we should come to a five-day week in this country, the result would be very beneficial to industry and cor merce. There would be other benefits, of course, but at present we are confining the discussion to the coldest business factors. We are seeking only to show that the interests which would naturally expect to be adversely affected by the change would be the first to benefit.

In the first place, the people who enjoyed a five-day week would consume more goods than the people who would be working a six-day week. Leisure time is a period of consumption and of the use of various utilities which are not employed when the community is at work. People who have more leisure must have more clothes. They must have greater variety of food. They must have more transportation facilities. They naturally must have more service of various kinds.

In the second place, this increased consumption would require greater production of supply than is now the case. Instead of business being slowed up because the people were "off work," it would be speeded up because the people consume more in their leisure than in their working time. This would lead to there being more work. And this to more profits. And this to more wages. The result of more leisure would be the exact opposite of what most people suppose it would be.

## The World Objective

PERHAPS now that the Soviet leaders have announced in so many words that their objective is nothing less than world revolution, those who regarded that program as the fearsome dreams of over-anxious folk will take the fact with seriousness.

Nothing comes of blaming the Soviets for what they do. They are perfectly consistent in all that they do. Their creed consists in the belief that the world must be turned upside down by revolution, and all that pertains to present-day order, culture or production destroyed. Believing that, they are perfectly consistent in the means they adopt to achieve it. Their weapon is treason and violence. Their objective being world-wide, so is their propaganda. No country is free from it. It is not any longer denied even in China. South America, India and other spots on the earth are active centers of dissemination of Soviet activity.

With the facts in hand, there is no duty more incumbent than that of alertness. It is impossible that Bolshevism can get the upper hand in the United States. Indeed, in their latest statement on the progress of their aims, Soviet leaders at Moscow specify the United States, Great Britain and Japan as the three principal centers of resistance to revolutionary propaganda. The reason for this is not our superior foresightedness nor yet our more active defensiveness; it is merely that we do not offer the kind of mentality that falls in with Bolshevistic aims. In other words, we are not that kind. Neither are the Anglo-Saxons anywhere. Nor are the Chinese and the Japanese. Russia will be disillusioned regarding China.

Nevertheless it seems almost inevitable that though Bolshevism cannot conquer this country, it can trouble it. We shall not surrender, but we shall suffer. The world uprising of the communistic elements will bring difficulty everywhere—they are causing difficulty already. But the end is not at all in doubt. It is sad, however, to see nations hastening into troubles which they might lessen by decreasing their indifference to the signs of the times.

It can never be said that Russia has not plainly told the world what it is doing and what it hopes to achieve.

## Whose Ox Is Gored

CANADA has long regarded the activities of the rum-runners with remarkable complacency. Coöperation in stamping out the nefarious traffic has been noticeably lacking. Whisky designated for "Mexico" had been shipped to interior points with official sanction. The attitude of the Dominion has been one of benign tolerance. But now the shoe pinches the other foot.

Smuggling is a trade that can operate in two directions. Why should an ambitious and hard-working rum-runner make the return trip to Canada without cargo? Why not smuggle contraband into that country also? Surely a bit of logic to appeal to any active bootlegger!

And so Canada now has a smuggling scandal of her own. The Dominion, so it is said, has been defrauded of millions in excise through the secret importation of dutiable goods. Bribery and pilfering of the exchequer are charged. Rumor reaches up to embrace high government officials. An investigation is under way in parliament. And a storm of righteous indignation against the evils of smuggling sweeps the country.

## Clean Humor Draws the Crowds

WILLIAM HODGE came to Detroit in *The Judge's Husband*, his own play, and the theater was packed at every performance—and would have been packed for weeks had he remained in town.

Fred Stone came to town with his family and his show, and if all the theaters in Detroit could have been turned into one, Fred would have filled them all at every performance.

Ed Wynn came to town, and no one bought a ticket the week he was here—they were all sold out the week before. He left the town full of talk about the folly of bringing Ed Wynn to Detroit for only one week.

George Cohan came, and the possessors of tickets would not trade them for seats on the New York Stock Exchange—they were just that scarce.

Why? Clean shows, Al. No nasty hits, Al. None of your dirty double-meanings, Al. Straight Anglo-Saxon fun—clever, fresh, refreshing. You can tell the comedian of alien grade from our own: our own are clean, clever, frolicsome, genuine.

The Christian comedian seems to be showing the New York producers how to start a run on the box office.

### *English or Jargon?*

LIVING in an age of changes, it is not surprising that we find our language being seriously affected by new vogues. Brevity has led to slang and slang, if not checked, must eventually lead to jargon and disintegration. The English language belongs to no particular country; it is the heritage of the Anglo-Saxon race. It is the newest language. It was young and crude when Latin was old and in ornamental decay.

The power of a language is expressed in its writers. English is a vital language. It has taken the best of the other languages with which it has come in contact and discarded the frills and unessentials; it is the language of a living, growing race. It is essentially a language of deeds and enterprise. Its very terseness denotes action.

But terseness must not degenerate into illiteracy. The infusion of countless races tends toward corruption of the native tongue. Literature suffers from neologism. Vulgar writers of foreign birth or extraction think it clever to violate our rules of grammar, of usage; they discard rhetoric for gibberish. This heritage of a great language is one we should jealously guard. It is a task not for a few learned professors or compilers of dictionaries, but for the press, the stage, the rostrum, the schools and colleges. We must take care that ours does not become a language of the gutter.

### *Blather*

THE American immigration law excludes from the United States:

> Those persons who have been convicted of or admit having committed a felony or other crime or misdemeanor involving moral turpitude.

Secretary of Labor Davis heeded this clause when the Countess Cathcart blandly admitted an offense we still hold reprehensible in this country. The law—unquestionably a good one—has been on our statute books for nearly twenty years. Thousands of undesirables have been excluded under its provisions. During the past year alone 251 persons were barred, with no great hue and cry raised in their behalf. But the 252nd case became a cause.

Lady Cathcart's arrival was heralded by zealous press agents. Her exclusion was capitalized down to its last dregs. Excitable women rushed to Washington shouting "discrimination." Saffron newspapers took up the plaint.

The cause suffered somewhat when a warrant was issued for the Earl of Craven, partner of her adventure, but the little group of apologists bravely carried on.

And then suddenly a great light shone forth. The countess, it was revealed, had come to America to peddle a play she had written. The crest of the publicity wave swept past, a little muddy at the edges. But the countess smiled—she had disposed of her play at a substantial price. Her subsequent admission under a court ruling came as an anticlimax.

### *Why Let Them Out?*

THE release from an Illinois prison of a wealthy youth serving a sentence for murder, and the recent freeing in California of a notorious swindler who had victimized scores of poor people, bring forcibly to attention again the inadequacies of our present parole system. Locally these two events are held scandals; nationally they form part of the cumulative indictment against a system shot through with imperfections.

The most glaring deficiency of the system lies in the fact that practical politicians and maudlin sentimentalists seem to govern our parole boards. Prisoners for the most part have the idea that they are released either because of political "pull," or because of lachrymose exhibitions of "good behavior." There is also a fatal defect in our prison system, judged as an expiatory and restorative institution. Rehabilitation of prisoners is a splendid thing. But the system of social protection and individual reclamation is not improved by indiscriminately throwing open prison doors.

Not long ago it was estimated that murderers sentenced to life imprisonment in one of our states served an average of seven years each. By no stretch of the imagination can seven years in prison be deemed expiation for cold-blooded murder.

### *Paid For*

A RATHER worn motor car made its way down the road. Its pep belied its evident age. It had started long ago, a shiny new thing, but though it had lost its shine and newness, it was still going strong, its inmost heart untouched by the superficial tributes paid to time. Gaily it sailed along, patches of brown rust showing here and there. On wooden spokes were places bare of paint. But the sturdy chug of its engine belied its external forlornness. It came and passed, and lo! upon its broad but shabby back this legend:

"You May Laugh At Me, But I'm All Paid For."

And that rather stops the laugh. It starts people thinking on another tack. She's a shabby old bus, maybe, but she belongs to the aristocracy of independence for all that—when she's all paid for.

It is a legend that many a big important car would be proud to wear.

Sitting on nail kegs discussing politics and settling the nation's problems.

# REACH OUT FOR NEW INTERESTS

By MARY E. BAYLEY

ILLUSTRATED BY HARLAN JOHNSON

LONGFELLOW sets forth only a few of the accomplishments of old age. For some of the world's most precious possessions have been produced by those who have reached the mark commonly known as "old age."

Cicero at the age of sixty wrote *De Senectute.*

Adam Smith, of Edinburgh, the greatest political economist of his day, when an old man wrote the book entitled, *Inquiry Into the Nature and Causes of the Wealth of Nations.* This book was responsible for England's policy of free trade and later for the adoption of a high protective tariff by America.

Losing his income, Luigi Cornaro at the age of 95 took up scientific farming and showed Venice how to reclaim and cultivate large tracts of waste land.

The great Titian, who as a child began to paint with the juices of berries, was at work on his marvelous painting—the Pieta—when at the age of 99 he was carried off by the plague that swept Europe in 1576; and the inimitable Michael Angelo was still at work with chisel and brush, when death claimed him at the age of 89. Verdi, the great composer, when long past 80 was at work in his studio. And August Rodin, the eminent sculptor, was at 80 "too young to die."

When he produced some of the greatest novels in literature, Victor Hugo was considered an old man. And William de Morgan wrote his first novel after 65.

William E. Gladstone, Premier of Great Britain, won some of his greatest triumphs when past 80, and at 82 was yet Premier.

Chevreul, the French chemist, who gave to France the dyeing process that assured to her the supremacy in the silk trade, lived to be 103. At the age of 94 he was in full charge of the Museum of Natural History in Paris. Before the New York Academy of Medicine a few years ago, ex-Senator Chauncey Depew (now nearing 90) told of being in Paris at the celebration of the 102nd anniversary of the birth of Chevreul. A gala performance was given at the opera at which Chevreul received a great ovation, which he met with enthusiasm. He did not leave his box until two in the morning. The following morning he attended a military review, in the afternoon he read a highly scientific paper, and in the evening attended a banquet at which Mr. Depew had the good fortune to be placed beside him. While they were in conversation an old man on the other side was filling his glass repeatedly and drinking to the health of everyone. This occasioned Chevreul much anxiety and Mr. Depew asked who the old gentleman was. Chevreul replied, "That is my son." Mr. Depew asked how old the boy was, and received the reply, "seventy-six."

The grand old man of American public health—Doctor Stephen Smith—(founder and first president, American Public Health Association) wrote *Who Is Insane?* when 93, and when on the verge of "attaining my century" wrote the first chapter on the history of *Public Health from 1871 to 1921.*

William Dean Howells wrote *Years of My Youth* at 77. He was presented with a gold medal about this time by the National Institute of Arts and Letters. Mr Howells lived to be well past 80.

When 84 Joseph Choate was still the recognized leader of the American Bar. From the time when he led the fight against the Tweed Ring in 1871 down to the last he was active in great affairs. He found time, however, to take honors in law and letters, and from 1899 to 1905 was ambassador at the Court of St. James, where he shone with distinction.

When 65 John Quincy Adams began his career; and this might also be said of Alexander Cassatt, the developer of the Pennsylvania Railroad system. Mr. Cassatt was well past 60. He had retired and considered himself an old man. He was a golf player. But one day there came to him on the golf course a messenger to say that he had been elected president of the Pennsylvania Railroad. With this message interest in life returned. The blood leaped to his heart. He was young again. All his life he had dreamed of a railroad in terms of engineering. The seeming impossibility of his dream ever being realized had smothered and dwarfed his potential greatness. And so he accepted on one condition: that he was to have a free hand as to engineering plans and money to finance them.

Mr. Cassatt became president and carried out the great plans he had dreamed of many years before, for the New York terminal, the elimination of grade crossings, and other improvements so radical and sweeping that only railroad men realized how much was done in the Cassatt régime.

The "Tiger" of France, M. Georges Clemenceau, is past 80, and our own "Uncle Joe" Cannon—who served the nation for 46 years as a legislator—has celebrated his eighty-eighth birthday.

Henry Holt wrote a book, *The Garrulities of an Octogenarian Editor,* when he was 82 years old. In one chapter, written at midnight, he told of having been around town in various active occupations all day.

Major George Haven Putnam, vet-

eran publisher, was 80 years of age not so long ago and in a talk with reporters told them that he liked it.

Charles W. Eliot led what used to be called a narrow life until the American people began picking out college heads as governors of states and presidents of the United States. For 40 years he was active president of Harvard University and saw it grow from a comparatively small college into one of the world's greatest institutions of learning. He became in 1909 president emeritus. Mr. Eliot's lectures and articles on social and scientific subjects are accepted as the best thought of our country.

Some years ago Chauncey Depew, the veteran of American politics, in delivering an address on "The Art of Growing Older and the Value of an Interest in Public Life," said when he was a boy seven and a half years of age his village had any number of old men and women. Every woman past fifty donned a cap which proclaimed her antiquity and wore a gray shawl which advertised the poverty of her blood. Every man retired at seventy and lounged indolently about the house or sat on a nail keg in the village grocery store and discussed the events of the day. Today one cannot find a woman wearing a cap, and indeed it is difficult to distinguish the mother from her daughter, and it is equally difficult to find an elderly man on a nail keg discussing politics.

Mr. Depew stated that he knew of nothing that had had such a tremendous effect upon the world as that utterance of David in the 90th Psalm: "The days of our years are threescore and ten, or even by reason of strength fourscore years, yet is their pride but labor and sorrow." "No one knew," he said, "how many untimely deaths this had occasioned. For this had been proclaimed from the pulpit as an inspired saying and men and women died because they believed it." In other words, the reason men and women became old more quickly in other days was because they thought about it more. It was impressed upon them that the proper thing to do was to grow old and that the proper place for a man of 80 was in bed.

In *The Garrulities of an Octogenarian Editor*, Henry Holt mentions an interesting fact along the same line regarding William M. Evarts, one of America's most brilliant lawyers. He states that Mr. Evarts, reaching the age of 80, went to bed and stayed there until his death four years later. There seemed to be nothing wrong with his body and he was apparently in good health, but he insisted that bed was the only proper place for a man after he reached 80.

There are few more interesting subjects than the question as to when age begins to touch a man and impair his powers. "After reading Ranke, Gladstone and Moltke," says Freeman, "one is inclined to place the beginning of old age in the seventies." Roger Bacon, however, claimed to be an old man at 52 and Sir Walter Scott thought himself old at 55. There is, we believe, no generalization that can be prudently applied to all. Attempts to draw a deadline have brought about many mistakes.

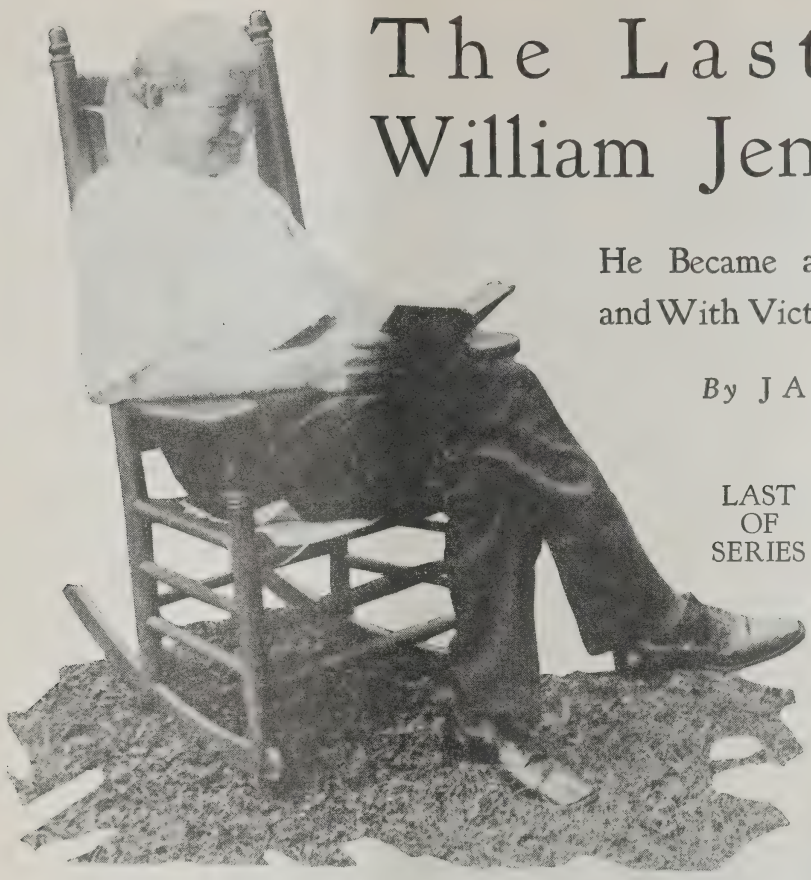
During the administration of Cleveland, when Morgan and Pugh represented the State of Alabama in the United States Senate, Judge Pettus, who was then turning 80, wishing to be elevated to the Federal Bench, sought the aid of his Senators. And when he went to Pugh, the Senator with some show of irritation, said:

"Why Pettus you are too old to ask for this appointment." "Maybe I am too old for the Federal judgeship," replied Pettus, "but I am young enough for the United States Senate." Mr. Pettus went out and made a rattling fight. And not only did he beat Pugh but he served for years in the Senate and made a fine record. Perhaps Pettus was an old man until Pugh stirred him up, but he then became young.

This, and the many instances of men coming back from retirement to a wonderfully active career, would seem to bear out the contention: "That if life still holds novelty for a man, he is young whenever and wherever that novelty touches him." For age, as it has been repeatedly proved, is not so much a matter of years as it is of point of view, that is to say—habit of mind.

"To know how to grow old is the masterwork of wisdom and one of the most difficult chapters in the great art of living" is a profound observation which we owe to Henri Frederick Amiel, the Swiss philosopher. From a perusal of the life of some of the "grand old men and women," it will be found that an energetic life mentally and physically is the formula they have followed as a means of achieving the masterwork. There is an old saying to the effect that many a man has achieved riches by a strict adherence to his own affairs. But like most old sayings it is true only to a certain extent. For it fails to mention that those who play this system seldom achieve anything else but riches.

That one—and especially one who has attained years—should have a wholesome interest in every phase of life—that he should know who the people are who



After he became seventy years of age Michael Angelo was put in charge of the construction of St. Peter's.

# The Last Days of William Jennings Bryan

## He Became a Crusader Against Evolution and With Victory Behind Him Died in Harness

By JAMES SCHERMERHORN

LAST OF SERIES

Mr. Bryan enjoying a respite from his arduous work during the famous "evolution trial" at Dayton.

"BOYS, you'll have a better time going to hell with me than in going to heaven with Bryan!" This was Clarence Darrow's greeting to a group of lads at the courthouse door in Dayton, Tennessee. It revealed the temper of the Scopes defense; the great criminal lawyer's scoffing at the Commoner's belief in God and the angels.

His seventh Presidential campaign behind him in 1920, with victory falling to the foe, Bryan had turned at once to the last supreme issue of his unwearying career as an advocate. Perhaps it would be more fitting to say as a crusader.

From addressing himself to what he looked upon as political wrong thinking and doing, he took up in dead earnest what he condemned as scientific error and presumption touching the origin of man. He went after evolution hammer and tongs. His impatience with the Darwinian theory of the beginning of man was reflected years before in that most famous of his Chautauqua addresses, "The Prince of Peace."

"Go back as far as we may," he told his audiences, "we cannot escape from the creative act, and it is just as easy to believe that God created man as he is, as to believe that, millions of years ago, He created a germ of life and endowed it with power to develop into all that we see today."

He had urged two reasons for his disbelief in the theory that man is the co-descendant with other mammals of a common progenitor. One was that he feared we should lose the consciousness of God's presence in our daily life if we accepted the theory that through all the ages no spiritual force has touched the life of man or shaped the destiny of nations.

The other objection was that the Darwinian theory represents man as reaching his present perfection by the operation of the law of hate—the merciless law by which the strong crowd out and kill off the weak. He preferred to believe that love rather than hatred is the law of development.

"If man links himself for generations with the monkey, it then becomes an important question whether he is going toward him or coming from him—and I have seen them going in both directions," said Mr. Bryan. "I do not know of any argument that can be used to prove that man is an improved monkey that may not be used just as well to prove that monkey is a degenerate man, and the latter theory is more plausible than the former."

He was ending, as he began, a quarter of a century of agitation with a surprise issue of his own creation, and investing it with tremendous vitality.

When he came with his anti-evolution thunderbolts to the First Baptist Church of Detroit on a Sunday night early in 1921, I confess I was no keener for the latest Bryan offensive than I was for the first. It looked as if my friend had gone far afield for his intense antagonism of evolution. So I thought and what could doctrinal disputation possibly get him?

And, of course, the Bryan-baiters lost no time in saying that he had turned back the hands of the clock and that he was leveling jeremiads at imaginary traducers of Holy Writ and old-fashioned religion, to bolster waning popularity and to prolong political prestige and platform appearances.

"An issue for another try at the White House!" said the knowing ones.

"First page space in the newspapers nothing else!" leered others.

But the impression one took away from that crowded church was that of an unrecanting gospeler defending the faith against growing disbelief and materialism—another Luther crying "Here I stand; I can do no other God help me! Amen."

As I sat late with the tired fundamentalist at the Detroit Athletic Club that night, he told me that the alarming spread of atheism among students was on his heart, and he was going to the University of Michigan the next day to warn them against scientific teachings that tended toward doubt and then disbelief and Godlessness. I asked him for a copy of the speech and although it filled an entire page with what I feared was none too thrilling matter, we ran it in full the following day.

Bryan was disappointed in the size of the student audience at Ann Arbor and ordered extra copies of the paper to the amount of $100, for which he paid out of his own pocket and sent them to a representative to be delivered among the students. There was no suggestion of self-seeking in that act nor in the gratuitous plea of the night before.

It was Chicago in 1896, Madison Square Garden in 1906, Baltimore in 1912, San Francisco in 1920 over again—ready to spend and be spent for that inward monitor that would let him do no other, even though it meant delivering his body to be burned.

Yet all the time "smiling through." When the guests came late through the storm to his sixtieth anniversary dinner at the Aldine Club in New York, he

said that he could sympathize with them—he had been out in the wet and cold many times himself.

Bryan went to the country with fundamentalism. He went to the General Assemblies of the Presbyterian churches with it. He had been a member of this denomination since his conversion at the age of 14. Thrice he made the issue a test in the selection of the moderator.

*"As Great as Ever, Mr. Bryan"*

His genius for stirring up the public mind was again demonstrated. His appeals to the student bodies incited educators to strike back in defense of scientists and their purposes. Clerics of the liberal school decried from their pulpits the taking of backward steps in religion. Secular and religious newspapers got quickly into the discussion, the daily press having lost none of its asperity toward the Commoner. The "monkey in the case" was tiptop material for the fun-makers of the comics and concert stage. The song-writers seized upon the tuneful elements of the discussion. Of course, you couldn't keep hand organs and coconuts out of the picture.

The Commoner sometimes used a most effective yet unusual device for getting in right with his hearers. He would propose two or three different speeches and let them decide by show of hands which subject they would like to have. Generally the vote was indecisive, which would leave him the privilege of making the selection and smoothing the way to the theme foremost in his thoughts at this period—the upholding of the Book of Books, letter and line.

"Next to the belief in God, I would place the acceptance of the Bible as the word of God," he would say. "I need not present arguments in its support; its claims have been established; the burden of proof is upon those who reject it. Those who regard it as a man-made book should be challenged to put their theory to the test. If man made the Bible, he is, unless he has degenerated, able to make as good a book today. Let the atheists and the materialists produce a better book than ours, if they can."

One Sunday morning in Detroit he spoke in the Central Christian Church. The pastor, Dr. Edgar DeWitt Jones, a friend and admirer for 20 years, who placed him at the head of popular orators of the twentieth century, detected a marked slowing down in the Commoner's delivery. A great deal of the old fire and magnetism were lacking, he thought.

But in the afternoon the presence of a great audience keyed the famous pleader to the old-time pitch. Again there was the well-remembered rhythm to his speech, the rising and falling of sentences like the waves of the sea. "It was possible," said Dr. Jones, "to beat time to the measured phrases."

When the pastor exclaimed, "As great as ever, Mr. Bryan!" the Commoner smiled and said: "Drop a line to Mrs. Bryan and tell her so, I don't want her to think I am slipping."

So Dr. Jones let Mrs. Bryan, down in the Florida home, know that her husband still had the power of commanding the applause of listening thousands.

*Only One Yellow Peril, the Lust for Gold*

He appreciated the element of oratorical surprise which Mr. Bryan used frequently with telling effect. He had heard him in a twenty-minute speech at the World's Missionary Convention in Edinburgh, Scotland, in 1910, when he captivated the audience, composed of some of the most distinguished churchmen in Christendom. Following a Chinese scholar, president of a Christian university at Nanking, Mr. Bryan began:

"We have heard much about the yellow peril, but I am here to say to you that there is only one yellow peril, and that is the lust for gold."

"The striking epigram was born of the moment," said Dr. Jones, "and it was so clever and so true that it brought the delegates to their feet in rounds of applause."

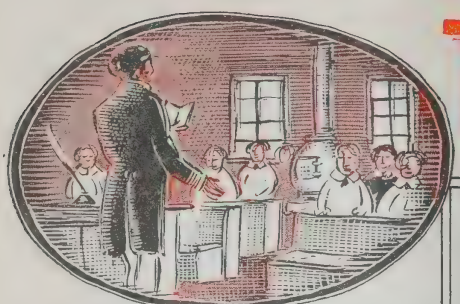
*When He Fought, and Won, His Last Fight*

Bryan's presentation of his case against the teachers of evolution to several Southern legislatures bore fruit in Tennessee, where a law was passed making it a misdemeanor to teach that man owes his origin to a lower form of life. The apprehension of young Scopes for violating this enactment in the public schools of Dayton prompted Mr. Bryan to volunteer his services without pay in the prosecution of the case.

Saying that while they were not the beneficiaries of any Florida real estate boom, they would come to Dayton and defend Scopes, Clarence Darrow and Dudley Field Malone aligned themselves on the other side of the case. This professional slur was the signal for the unfailing lampooning of Bryan.

I had dropped off at the little Tennessee town to see about joining the Bryan party on its pilgrimage to the Holy Land in February, 1926. I did not know till I reached Dayton that it was to be a congratulatory call upon the Commoner. But the calm in the somnolent streets indicated that it was all over but the pronouncing of sentence.

The court, after excluding the defense's great cloud of scientific witnesses, had adjourned over Sunday. The issue was reduced to the culpability of young Scopes in defying his employer, the State of Tennessee.



It was a happy triumphant afternoon on the Bryan porch. Delegation followed delegation in congratulatory calls. I recall distinctly what he said to a small group of newspaper friends, not for publication, but because he wanted to set them right.

He was not against science or scientists, but in all his public life he had voiced his admiration for the proved and provable principles worked out by the light-seekers on the frontiers. But the origin of species and genesis of human life in the one-cell amoeba were guesses; and in preference to the theories and speculations of biologists he would take the Bible version of the be-

(Concluded on page 26)

Mrs. Bryan, despite her position, has been little photographed. This picture was made at the home of Mr. and Mrs. Bryan's daughter in Los Angeles.

# THE GRAND OLD MAN OF

Presbyterian Church at Oxford, Ohio, where Dr. William Holmes McGuffey preached to capacity congregations nearly one hundred years ago. Dr. McGuffey preached more than three thousand sermons during his life, and could repeat any sermon years afterward substantially as first given.

## Dr. William Holmes McGuffey's *Eclectic Readers* Have Molded the Characters of Many

By BENJAMIN COLBY

DRAWINGS BY W. O. FITZGERALD

Haste thee, school-boy, haste away,
Far too long has been thy stay;
Often you have tardy been,
Many a lesson you've not seen;
Haste thee, school-boy, haste away,
Far too long has been thy stay.
—*McGuffey's Third Reader.*

IF ONE sought to learn just how many schoolboy feet had been hastened by the readers from which this classic gem was taken, he would have a Herculean task. The paltry few hundred thousand copies of our "best sellers" become insignificant in comparison with the sale of these famous books of another day. The most reliable estimate, made by a man who sold them for many years and retired as general manager of the house that published them, places the total sales since 1836 at between fifty and sixty million—a record exceeded only by the Bible. When it is remembered that during the period of their greatest use schoolbooks were not obtainable so readily as today, and that sometimes they passed through many hands before their period of usefulness was over, the influence of the *Eclectic Readers*, written and compiled by Dr. William Holmes McGuffey, is seen to be really incalculable.

To that generation which we speak of as the "present" these readers form merely a faint figure of yesterday, a voice, hardly distinguishable, echoing down a musty and unexplored corridor. But to millions who conned their pages in schoolhouses from the Great Lakes to the Gulf, and eastward to the Atlantic, they are remembered as freshly and clearly as a fascinating novel that might have been closed regretfully last night.

The characters of the novel, though, may have become blurred in a sleep of eight hours, and the novel itself perhaps had been forgotten in a few months, whereas the imprint of the McGuffey Readers has been indelible. They mark an epoch of well more than half a century, when America was still half-pioneer. The songs of poets and the weighty utterances of statesmen during this time have been forgotten, but surely there is not to be found a former McGuffey pupil who cannot recite from memory—

"Oh were you ne'er a school boy
And did you never train,
And feel the swelling of the heart
You ne'er can feel again?"

So deep and lasting was the impression these books produced that former McGuffey pupils recently have been banding together in what might be termed "alumni associations"—the alumni of the Little Red Schoolhouse. In Columbus, Ohio, New York City, Indianapolis and in many other towns and cities the "McGuffeyites" have organized.

Before one can understand such a movement as this, one must know the books, themselves, the well-worn, dog-eared volumes, passed from hand to hand and becoming rarer and rarer. Here and there can be found a complete file of the readers, from the First through the Sixth. At Miami University, where William Holmes McGuffey compiled the original series of four books, in the office of a Cincinnati publishing house, and in a few other places such files exist, but they are guarded jealously, as treasures that could hardly be duplicated.

They were not merely readers as the child of today knows such textbooks. They were a combination of literary guide and moral preceptor. In addition to teaching the English language, they offered a strict moral code, in which every wrong was punished and every good act rewarded. Each story pointed its moral without sugar-coating.

Who has not heard the tale of the boy tending sheep, who twice raised the cry of "Wolf!" when there was no wolf, just to see the men come running from the village? When the wolf did come, the men who had promised to help paid heed to his shouts, and many sheep we killed. McGuffey ends this characteristically by—

"The truth itself is not believed,
From one who often has deceived."

This story is one of many that ha become familiar throughout the ent country chiefly through the distribution McGuffey's Third Reader, probably t most famous of the series. Another clas from the Third Reader is the adventu of Harry and the ghostly guidepost, wi the usual clearly expressed, didactic mo at the end.

The signpost, which arose "in dead white," held Harry at bay in the darkne for some time. Finally he conquered h fear and went up to examine it. When

# LITTLE RED SCHOOLHOUSE

Above—McGuffey Hall, Miami University, where the work of the famous schoolmaster is carried on by training men and women in modern pedagogical methods.
Circle—Table used by Dr. William Holmes McGuffey in writing and compiling the famous *Eclectic Readers*. He built the table himself. The relic is preserved at Miami University.

ound it was only a friendly sign to direct
m homeward—

"Ah well, thought he, one thing I've
learned,
Nor shall I soon forget;
Whatever frightens me again,
I'll march straight up to it."

McGuffey began definite moral instruction with the First Reader. The mischievous boy who played ghost and made another boy insane offered an instance of the dire consequences of wrongdoing. And coward came surely to the chimney sweep who was tempted to steal a watch, but put it back. He was educated by its owner in recognition of his honesty.

The fable of the hen that tried to get her chickens to cross the brook by jumping from stone to stone came in the Second Reader. The chicks refused to make the effort and complained that she expected too much—all but one valiant, who tried and failed. His mother rewarded his pluck by giving him the first food when they returned home. In the McGuffey Readers the good always got the goods.

These moral lessons continued throughout the series, but always there was a definite advance toward maturity in each reader. In the Fourth Reader there were seventeen selections from the Bible, Bacon's Essay on "Studies," two extracts each from Milton and Shakespeare, and other selections of literary worth.

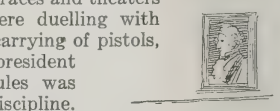
The material used in the Fifth Reader —compiled by Alexander H. McGuffey, a half-brother of William Holmes McGuffey —was taken from the great writers, historians and preachers, and contained much leading to a true appreciation of the best in the English language. Bryant's "Thanatopsis," "Hamlet's Soliloquy," "Speech of Henry the Fifth to His Troops," Patrick Henry's Speech before the Virginia Convention give an idea of the type of reading offered in this volume and in the Sixth Reader, which drew much from it.

"In these books we were indeed led by a schoolmaster, from beautiful maxims for children up to the best thoughts of a long line of sages and poets and naturalists," said an old McGuffey pupil who became a famous preacher. "There we all first learned the awful weakness of the duel that took away a Hamilton; there we saw the grandeur of the Blind Preacher of William Wirt; there we saw the emptiness of the ambition of Alexander, and there we heard even the infidel say, 'Socrates died like a philosopher, but Jesus Christ like a God.'"

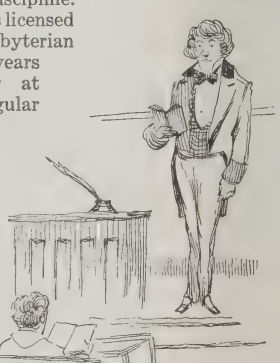
If an institution is the "lengthened shadow of a man," what a remarkable man must have been William Holmes McGuffey, whose shadow, after half a century, is growing through sheer spontaneous appreciation of persons who received his teachings as part of their earliest remembrance!

He was born in Washington County, Pennsylvania, in 1800, the son of Alexander McGuffey, who had come to America at the age of six in 1774. Education was difficult to get in those days; a great public school system did not exist. Scattered "academies" lifted their impecunious heads bravely here and there in what then was the West. One of these had been built in 1802 by the Rev. Thomas Hughes, a Presbyterian clergyman, at Darlington, Pennsylvania, and was known as the "Old Stone Academy." He obtained money to build this school by traveling horseback eastward through Pennsylvania, and even to New England, soliciting.

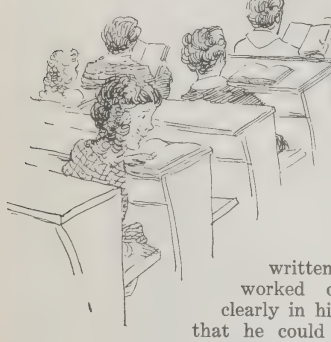
The story is told that McGuffey's mother, on a summer day in 1818, was praying in the garden behind the McGuffey log cabin, thinking no one near, when Hughes came by on horseback. She was praying that opportunity might be afforded for the education of her children. Hughes later sought out the mother, and as a result William Holmes McGuffey entered the Old Stone Academy.



McGuffey was twenty-six years old when he graduated from Washington College, following his academy preparation. His education was obtained under conditions that would seem hard indeed to the youth of today. At the academy, where his board cost seventy-five cents a week, McGuffey lived on bread, butter and coffee for breakfast; bread, meat and sauce for dinner, and bread and milk for supper. The tuition charge was three dollars a



year. During the summer vacations he worked in the fields, continuing his studies and walking many miles each week to recite his lessons to a clergyman.



His college course was interrupted by the necessity of earning money, and during a year spent teaching school in Paris, Kentucky, he met Dr. Robert H. Bishop, president of Miami University, who was so impressed by the young man that he obtained his appointment as professor of ancient languages at Miami, March 29, 1826, even before McGuffey had received his bachelor's degree, which he got shortly thereafter.

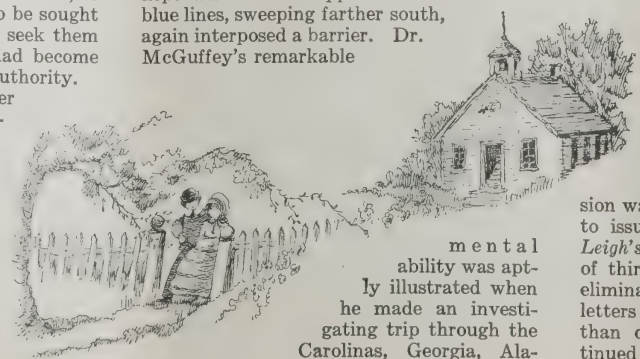
Miami had opened its doors for collegiate instruction only two years previously, although it had been authorized by Congress in 1792 and founded by the Ohio Legislature in 1809. It was a school thoroughly in earnest, as is evidenced by the announcements of that time, which read: "Study hours, 5 to 7 a. m. and 2 to 5 p. m.; prayers, 9 a. m. and 8 p. m." The estimated expenses for the year were $93. Amusements such as attendance at balls, horse races and theaters were banned—as also were duelling with deadly weapons and the carrying of pistols, dirks and stilettos! The president who laid down these rules was criticized for his strict discipline.

Dr. McGuffey soon was licensed as a preacher in the Presbyterian church, and spent ten years teaching and preaching at Miami. He never had a regular charge, speaking in the college chapel and occupying the Oxford Presbyterian pulpit. At both places he drew capacity audiences. His sermons, never

written, were worked out so clearly in his mind that he could repeat them years later substantially as first given. He was a man of rigorous mental habits.

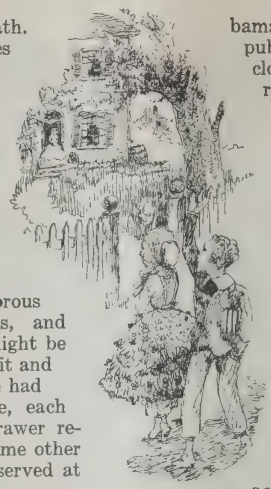
Here at Miami Dr. McGuffey prepared the original series of *Eclectic Readers*, the First, Second, Third and Fourth. The first two were published in 1836 and the others in 1837, by the firm of Truman & Smith, of Cincinnati. It was his fortune to be sought by his publishers rather than to seek them out, for even at that time he had become recognized as a pedagogical authority.

A princely royalty of ten per cent was to be paid to Dr. McGuffey by his publishers until one thousand dollars had been paid, after which the books were to become the property of the publishing firm. This contract was carried out, but Dr. McGuffey's services were retained for revision of the readers, and later an annuity was settled upon Dr. McGuffey by the publishers, which continued until his death.



As might be expected of a series of books that have had such a great influence on American life, they were compiled in a very thorough and systematic way. Before material was placed in the readers it was read to a group of children gathered at Dr. McGuffey's house, and their interest was estimated. In this way the children themselves collaborated in editing them.

Dr. McGuffey was an omnivorous reader, especially of newspapers, and whenever he saw anything that might be used in his schoolbooks he clipped it and filed it away. For this purpose he had built a revolving octagonal table, each octagonal section containing a drawer reserved for one of the readers or some other special subject. This table is preserved at Miami University today.



The First, Second, Third and Fourth Readers were "improved and enlarged" in 1838. McGuffey's *Rhetorical Guide*, which afterward became the Fifth Reader, was compiled by Alexander H. McGuffey and published in 1841. The name was changed two years later, when the four books of the original series were remodeled extensively, "newly revised," as the title-pages said. In 1853 the *New McGuffey Eclectic Readers* were issued in six books instead of five, and remained substantially unchanged until 1879. Notice was given at this time that the engravings used were copyright property and must not be used by others. Previously, most of the illustrations had been evident copies of English woodcuts. After a revision in 1879 the readers were used widely for the remainder of the nineteenth century.

As early as 1841 seven hundred thousand copies of the *Eclectic Readers* had been sold. Even then the possibilities of the books were seen by one member of the Truman & Smith partnership, and when differences arose in the firm Winthrop B. Smith chose the four readers and two other books against all the other assets, and agreed to take them as his share when the firm was dissolved. The deal was made and Smith became sole owner of the series.

When the Civil War opened the *Eclectic Readers* had spread throughout the Mississippi Valley. Their sales in the South were heavy, and when the advancing Federal lines cut off communications with Cincinnati, the Methodist Book Concern, of Nashville, promptly took up their printing and kept the market supplied until the blue lines, sweeping farther south, again interposed a barrier. Dr. McGuffey's remarkable

mental ability was aptly illustrated when he made an investigating trip through the Carolinas, Georgia, Alabama and Mississippi for his publishers shortly after the close of the war. Meager reports of looting and carpet-bagging of a defeated people—in some cases practical servitude at the hands of a riffraff—came north from a demoralized textbook market, and Dr. McGuffey was sent to find out the exact situation. During a trip in which he visited nearly all the larger cities of the southern states and talked with the governors and other important men, Dr. McGuffey never made a note, yet when he told his story back in Cincinnati it was with an accuracy that could not be questioned. It is said that he never hesitated for a name while giving an account that consumed several days.

The author of the McGuffey Readers was at this time professor of natural and moral philosophy at the University of Virginia, a post he had held since 1845. Leaving Miami in 1836, he had been successively president of Cincinnati College, president of Ohio University, and a professor in Woodward College, Cincinnati. He remained at the University of Virginia nearly thirty years, until his death, May 4, 1873, and was one of the most popular members of the faculty. It is said he taught "with the simplicity of a child, with the precision of a mathematician, and with the authority of truth."

In Virginia he labored for the passage of a public school law, as he had also done in Ohio. Soon after joining the university faculty he made a tour of the state in the interest of such a law, but it was twenty-five years before he was rewarded by achievement of his aim.

Dr. McGuffey is described by Henry H. Vail, long connected with his publishers as literary editor, as:

"A man of medium stature and compact figure. His forehead was broad and full; his eyes clear and expressive. His features were of the strongly marked rugged Scotch type. He was a ready speaker, a popular lecturer on education, and an able preacher."

His activity was unceasing. At the age of seventy-three he wrote a book on philosophy as the result of research and study over a period of ten years, but so critical was he of his own work that after the book, of 500 pages, had been set in type he became dissatisfied with the manuscript and ordered it withheld. It is now in the hands of Dr. Charles McGuffey Hepburn, his grandson, who is dean of the Indiana University Law School. After Dr. McGuffey's death, in 1878, the readers were revised again, this being followed by another revision in 1901. Most McGuffeyites probably will be surprised to hear that they are still having a steady sale, although, of course, greatly changed from the books of fifty and seventy-five years ago. Along about the time the 1879 revision was made, the publishers were induced to issue the readers, as an experiment, in *Leigh's Phonetic Spelling* using an alphabet of thirty-eight characters which sought to eliminate confusion arising from certain letters in the regular alphabet having more than one sound. But they were discontinued and the regular readers re-adopted.

# Chats with Office Callers

***The Man from Alaska*** dropped into The Office. He was most emphatic in his assertion that we in the States know little of the real Alaska. Alaska, he said, is a continent in itself. It is the last frontier. It is a fertile land with a multitude of natural resources. Grains, fruits and vegetables will mature in the long, hot days of summer. The sun, in midsummer, sinks low in the haze, a glowing ball, but does not drop below the horizon. The temperature frequently rises to 100 and 120 degrees. The rich earth steams and a sea of Alpine flowers spring up on the peat soil, blossom, mature and scatter their seeds. We think that a man who would take a dog team 1,500 miles across Northern Alaska with the temperature cracking down around 40 below is an exceptionally hardy individual. Not at all says the Alaskan. It is made in easy stages with fast dogs. The driver is clothed in furs and a hooded parka. The log rest rooms are frequent and cozy. The air on the trail is bracing and invigorating. The only thing one must watch is the ice.

Frequently in crossing the bays and inlets of the sea, great chunks of ice break off and start seaward. If the dogs and man are not alive to the situation they are lost forever. What does the future hold for Alaska, I asked. Alaska, said he, is the last frontier. It is a matter of transportation only. But we are not ready for development. We still have the Inland Empire and the rich valleys of the coast states to fill. These will soon be populated and the overflow will find its way north to our territory. If we Americans were a colonizing race as are the British we would have a larger Alaskan population. Alaska is one-third the size of the United States and has but 35,000 whites. Great Britain will furnish transportation for a family of five from Glasgow to Alberta for $16. Alberta does her duty when they arrive. When the Canadian Northwest and our own Northwest is filled we will see Alaska come into its own.

---

"I don't know where we are going to wind up in this country," said the ***Banker from The City*** as he sat at lunch, "if we keep going as strong as we have been on this credit business and installment selling. It is not quite popular to say so, I know. Bankers' associations are being freely quoted in favor of going into debt. Credit associations are naturally in favor of it. My wife tells me that credit customers are preferred to cash customers at the stores. If you ask for credit, there is nothing they will not do for you. If you lay your money on the counter, they don't feel that you belong. We are more strongly organized now to enable people to get credit than we are to enable them to pay cash. It does not look like a wholesome situation to me.

"I know families that are all filled up with installment payments. Their entire income is parceled out in payments they have to meet. Now, that means that they *have* bought; it also means that they are not buying *now*—they cannot. They are sold up to the limit. All that is possible for them to do is to add to the debts on which they are paying, still further debts on which they cannot pay. Either way, as it seems to me, we are forcing a condition where some interval of normalcy, some breathing space, must ensue: either we shall have to slack up a little until people get enough cash accumulated to go on a cash business, or we shall have to slow up until people get their present schedule of installment payments out of the way so that they can buy more. As a matter of fact, you cannot stretch credit any further than you can money. For all this credit, someone is supplying the money. You have got to get down to brass tacks eventually.

"There are legitimate credit responsibilities which people should take on their shoulders. For example, few can pay cash for a home; it is legitimate to purchase a home on the installment plan. But for the multitude of commodities which are now the objects of credit the people used to pay cash or nearly so. They never thought of doing anything else. When they wanted some little thing for the home, they bought it and paid for it. If they did not have the money, they saved it. They used to pay cash for their automobiles too. What has happened to move them off a cash basis? I am very far from being pessimistic, but I strongly dislike to see the American home become subservient to 'installments.' I would like to see the tone of independence come back—'I owe no penny I cannot pay; I envy nobody, no not I, and nobody envies me.'

"Of course, I don't want to suggest what might happen if some day everything slackened up and installment payments stopped. But it is something that the careful man will think of."

# Reach Out for New Interests

(*Concluded from page 13*)

keep the world moving and how they do it—is the precept which has kept youth alive in many of our most noted veterans.

A wholesome interest outside of one's home or business will go a long way toward keeping the thoughts from troubles and grievances. It has, in fact, been proved time and again by both men and women that a continual reaching out for new interests to make a part of the mental and physical geography makes for physical and mental vigor. Men and women of this type may be young at 60, 70 or 80, while the person who is mentally and physically idle may be old even before 50. And when we stop to ponder the cause, it is not difficult to find—the avoidance of a narrow, introspective life.

Activity is unquestionably the foe of decay. As long as one is alive there is a chance to do things. Frequently we hear people say: "Oh, that is beyond me," or "I am too old to begin to study anything new." Why set limitations? There is in the mind no element of time. Time is merely a chance for unfoldment. Time is opportunity.

There is really no proper time for anyone to step out of the world of thought and action. For maturity should, after all, really mean a larger opportunity for service. And is there any good reason why anyone should spend the greater part of life accumulating wisdom and experience only to throw it away by supinely admitting that a certain number of years constitutes the span of life:

"For what is age but youth's full bloom
A riper more transcendent youth,
A wedge of gold
Is never old
Streams broader grow as downward rolled."

The same idea is beautifully expressed by Le Gallienne in his reference to an old oak tree:

"A 100-year-old oak tree has the spirit of life more abundantly and victoriously than when a mere sapling; the fire of youth in the old tree is mightier than in the swaying, trembling sapling. Thus by 'old' is meant that it has gone on victoriously adding strength to strength, freshness to freshness for 100 years. Not that it has lost its efficiency, nor withered and decayed. Call it old when its limbs turn black and leafless; meanwhile it remains mightily young—young as the morning it greets."

---

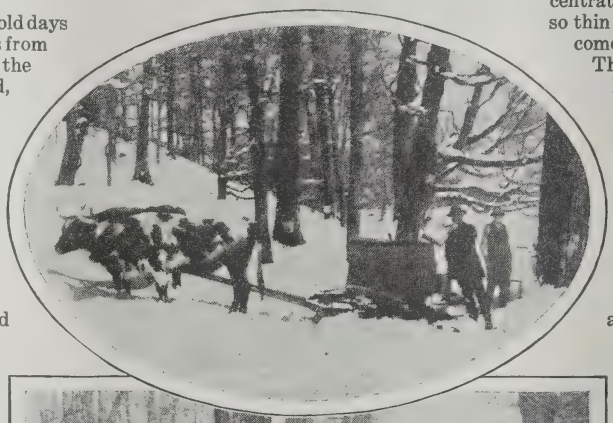
"BUT why, you ask me, should this tale be told?
To men grown old or growing old.
It is too late! Ah, nothing is too late
Till the tired heart shall cease to palpitate.
Cato learned Greek at 80;
Sophocles ————
Wrote his grand *Oedipus*
And Simonides
Bore off the prize of verse from his compeers
When each had numbered more than fourscore years.
And Theophrastus, at fourscore and ten
Had but begun his *Characters of Men.*
Chaucer at Woodstock with the Nightingales
At sixty wrote the *Canterbury Tales.*
Goethe at Weimar, toiling to the last,
Completed *Faust* when eighty years were past.
These are indeed exceptions, but they show
How far the Gulf Stream of our youth may flow
Into the arctic regions of our lives
Where little else than life survives."

# When the Maple Sap Is Running

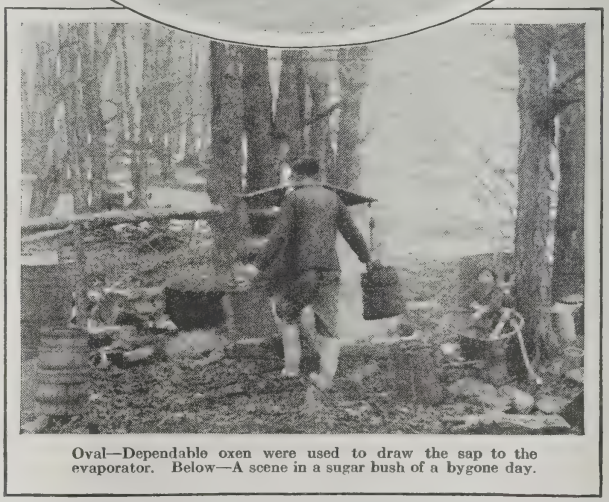
## Rare Delights of Woodland Sugar Making

When you see the vapor pillars
Link the forest with the sky,
You may know the days of sugar-
Making then are drawing nigh.
Frosty night and thawy day
Make the maple pulses play,
Till congested with its sweetness,
It delights to bleed away.
—*Perrin B. Fisk, 1860.*

MAPLE sugar making in the old days was a far different process from that used at present. In the region where I was reared, expensive evaporating pans and fire arches were unknown. Northern Michigan was covered with virgin hardwood forests; maple had little value other than for firewood.



About the latter part of February, we would "feel the spring" in the air. Noisy crows would congregate in the tree tops. Mist was in the valleys, and the sound of water dripping from the trees tinkled musically on the deep-crusted snow. A tinge of wood smoke, hanging low, foretold a rain storm. The mellow light of the late winter sun brought memories of the Indian summer days of autumn. Cold, frosty nights followed by warm, sunny days brought ideal sugar weather.



To tap the tree we chopped a 16-inch gash diagonally across the south side about three feet from the ground. Just below the base of the cut we would drive the iron spile maker two inches into the tree. Removing the iron from the cut, we would pound into the incision a sharpened wooden spile. The sap would run down the gash and out on the spile, dripping from the end in a steady stream. For sap containers we used shallow milk pans eighteen inches in diameter and five inches deep. These were blocked level at the foot of the tree. A sled drawn by a yoke of oxen was used to collect the sap. On the sled were two large barrels, with screened holes in the top, and each barrel had a spigot near the bottom.

The sap was gathered in large pails suspended from the ends of a wooden yoke by means of a heavy cord or fine chain, and stored in barrels about the fire. It was boiled down in huge black kettles, such as are used today by the Negro mammies of Georgia and Florida, to do their washing in the open.

Ten feet from the open fire a hardwood post ten inches in diameter was set into the ground, extending five feet above the surface. In the top of this post was driven an iron rod two inches thick, extending eight inches above the post top and exactly in the center. A hardwood pole, nine inches thick and twenty feet long, thoroughly dried, was then laid on the post and a 2½-inch hole was drilled into the pole six feet from the smaller and lighter end. Through this hole the iron rod stuck up an inch or so above the horizontal pole. The kettle was chained to the small end of this pole. The other end, being heavy, acted as a counterbalance, making it an easy matter to swing the kettle on or off the fire to refill or empty.

The product was strained and placed in containers for distribution. Boiled in the open the sirup was somewhat darker than that boiled in the evaporators. This was due, no doubt, to the fact that rain-washed twigs and bits of shaggy maple bark, moss and other forms of "clean" dirt would find its way into the kettle. But it was good. After a lapse of twenty years I can still taste the maple taffy we made by pouring the last of the kettle boilings on the snow, where it hardened.

Oval—Dependable oxen were used to draw the sap to the evaporator. Below—A scene in a sugar bush of a bygone day.

As the demand for maple sirup grew, the more enterprising farmers and lumbermen replaced the old kettle with the more modern evaporator. This evaporator was a single shallow pan, resting on an arch made of stone mixed with clay. It was usually built in the open, on a hillside with the hill dug out a bit for the back end of the arch. The smokestack was at the upper end to insure a good draft. Sometimes it was built under a shed. The inflow of sap was regulated by means of a stopcock on a hose leading from a barrel containing the oldest sap, placed at an elevation above the evaporator. Later on the single evaporator gave way to the more modern evaporator divided into sections.

As the sap became thicker it was run from compartment to compartment until the last pan held only sirup. As it thickened it was tested with a spoon to determine its proper consistency. The sirup consistency is governed by statute in Michigan, and the sirup maker must test his finished product with a hydrometer. These hydrometers, as well as thermometers, are used to get the sirup to a point where it is not so concentrated as to rapidly turn to sugar nor so thin as to ferment and sour when summer comes. If it sours, vinegar is made of it.

The sap sled is still used, but the yoke has disappeared as the sled trails are made nearer the trees. No longer are the maples slashed, cut and disfigured. Small holes are bored into the trunk and an iron circular spile is driven in. A sap bucket is then hung on the spile and the run is on.

The season usually lasts three or four weeks, sometimes longer. In certain bushes it takes as high as 50 gallons of sap to make one gallon of sirup or 7½ pounds of sugar. The first run is generally richer in sugar, hence it takes less for a gallon of sirup. From 6½ to 9 pounds of sugar, according to the kind, can be made from one gallon of standard sirup, with an average of 7½ to 8 pounds. A bush of 100 trees should produce 40 gallons of sirup or 300 pounds of sugar.

The old days are passing. The pleasure of driving a yoke of oxen attached to a sap sled through the early spring woods is of the past. The saucy squirrels, scampering up the maple trees, would kick bark, spiders and lichen into the sap pail. But I would delight in again breaking the ice of one of those pails and drinking the sap of an early spring morning when the frost whitened the old rail fence and ice hung from the spiles. The sun would break through the trees and the red-headed woodpecker drum his tattoo on the dead hemlock. At the next tree we might disturb the cock grouse and hear him fly off on thundering wings. One must penetrate far into the bush to find these things now.

On cold winter mornings, when the rich maple sirup trickles over the hot buckwheat cakes or the crisp, brown waffles, one is apt to see a mental picture of a sturdy old-timer, muffled up to his ears and, perhaps, shod with snowshoes, trudging over snow-drifts that crunch under his tread. Over his shoulder one visions the yoke with a pail dangling from each end, brimming with sap. All about him stand towering maples denuded of leaves. To the uninitiated they look like rugged oaks. Hardwood trees, they have little in common with the soft maples of our roadsides. Here and there between the maples grows a clump of hemlocks, some tall and spreading with dark, green needles, others little more than mere shrubs. The perennial green of the hemlocks add a touch of color to the still hardwoods, a touch of life in an apparently dead forest

"I THOROUGHLY believe in university education for both men and women," writes Professor William Lyon Phelps, of Yale, "but I believe a knowledge of the Bible without a college course is more valuable than a college course without the Bible. Western Civilization is founded upon the Bible; our ideas, our wisdom, our philosophy, our literature, our art, our ideals come more from the Bible than from all other books put together." Such an imposing statement, from a source of recognized authority, behooves us to think twice before we set aside as another bit of pious talk the current plea for more adequate training in the Bible, for a more intelligent study of the Bible.

# Giving Back the Bible to Our Children

## Some Important Points About the Dayton Plan for Again Restoring Religious Training to Youth

By Dr. MILES H. KRUMBINE

THIS nation of ours was intended by the "founding fathers" to be reared and nurtured in religion. The constitution of more than one of the states says quite plainly, as that of the State of Ohio says: "Religion, morality and knowledge being essentially necessary to the good government and happiness of mankind, schools as the means of instruction have ever been encouraged by legislative bodies, not inconsistent with the rights of conscience." The foresight of the founders of our great nation envisaged a people steadily maintained and constantly refreshed in their moral and civic life by stedfast attention to the inspiring ideals and sound principles of their religion. They not only assumed that our civilization rests on the Bible but they made provision in the great documents that guarantee us our liberty for the furtherance of that knowledge. Religion and religious education therefore are not merely a desirable issue but clearly belong in the organic structure of civic training.

One who surveys the American nation daily sees clearly enough that we have permitted our great heritage to slip from our grasp. Fifty years ago the public school curriculum contained an abundance of material for real training in religion. We were neither so bigoted nor so spiritually dull that we resented the presence of Biblical and other religious material in our public school curriculum. We took quite seriously the value of training in religion in citizenship making. Since that time we have completely secularized the public school from kindergarten right through high school and state university.

***Where Religion Is Made a Side Issue***

Religion is definitely set forth to the mind of the child as an issue desirable perhaps, but having no place in the organic life of the American school. To my mind this is deplorable beyond words.

That this great nation, founded by men who brought only a dominating religious motive as their source of strength and power, should so cavalierly dismiss the means by which that motive could continue to play on the life of the on-coming generations, should so nonchalantly secularize its schools, gives one pause.

I understand clearly enough that a minority can and does object to teaching religion in the public schools because not everybody that lives in America is Christian. On the other hand, I should like to point out that there are social tendencies in modern American life that trace back, in my mind, directly to the indifference to religion which has possessed us.

The first of these tendencies is evident in any city in America if one visits either the court of domestic relations or the homes of that city. America is witnessing the rapid disintegration of the home. There are children in my city who call themselves "alimony children" and are called that by their little friends. They have no homes and their future is the future of those who must of necessity be brought up without the beneficent influence of the home, however humble that home may be. In time past there was no divorce evil, though of course there were divorces, because the great underlying principles of religion, which insist on integrity of character, stability of principle, the sanctity of agreements between people, the exercise of will in all the relationships of life, were in operation. It is worthy of note that from 1620 to 1691 in the first Pilgrim community (with a population that during that period ran up into the thousands) there were only six divorces and very few cases of immoral conduct of any sort or variety. This Pilgrim community is the rebuke of history to our modern laxity in this respect. The future is dark indeed when one contemplates the social possibilities of this evil unless we can somehow restore the place of religion in the life of our people.

***Divorces Were Few Among the Pilgrims***

The second alarming social tendency is the disobedience of and disrespect for law. We, as a people, have fallen into the habit of expecting our country to be run by government through the medium of law. For each new crisis we want a new law. At the same time we have permitted ourselves to be mastered by our selfish instincts and have given way to the will to disobey in a manner that is positively astounding. At the present moment the popular trend certainly is that any man or group of men who dislike a law can disobey, ignore, or by their conduct nullify it without running the risk of public scorn and displeasure.

Disobedience to law cannot be overcome by passing new laws compelling people to obey the law. The very suggestion is absurd. So far as I can see the only way to develop a law-abiding nation is to inculcate the age-old religious principle of obedience, first to fundamental moral law of the Ten Commandments, and then such other laws as of necessity spring from them. We will counteract this tendency when we get back to a religious basis for our national life.

A third alarming fact in our social life is the high hand with which graft and corruption have dealt in our land without begetting so much as a ripple of social indignation. That there is graft and corruption in public life is not dangerous to the social order when men and women still have in them the capacity to become morally indignant. That capacity has given way to a tame acquiescence in modern life. But we acquiesce because our own ideals have suffered impairment. The proper approach is the building up of our own ideals, and again we are face to face with religious training. We build up ideals when we derive them from the authoritative basis of religion.

I have pointed out the current problem in the home, in the state, and in the world, and the unmistakable fact stares us in the face that every one of these problems brings us straight to a new appraisal of the meaning and value, the real social power, of what might be called a re-birth of religion, the renaissance of religious life. To have said this much, however, is to solve nothing. Queen Victoria at one time was very much distressed at the social life of the higher classes. She asked Mr. Delane, the editor of the London *Times*, that he frequently write articles pointing out the immense danger and evil of the wretched frivolity and levity of the views and the lives of the higher classes. Lytton Strachey facetiously adds: "And five years later Mr. Delane did write an article on that very subject yet it seemed to have little effect." No, articles of protest and analysis are not enough. One must go quite beyond that. I shall try to point out what perhaps may be done as a meager beginning.

***Citizenship Begins in Training the Children***

The logical place to begin, if we are going to rear a generation of law-abiding, home-making citizens, is with the children. If you want to convert an Indian, the old saying was, catch his grandmother. If you want to make an American citizen catch the child. Not only the church, but also the civic groups, the chambers of commerce, the industrial institutions, the schools will have to take very seriously the budding, child-life growing up around us. Indeed, that very child-life is suffering from the prevalence of divorce. The juvenile crime

rate has increased more than 450 per cent in the last fifty years. Little can be expected from "alimony children" in a population where we have now two divorces to every fifteen marriages.

Today one doesn't have to argue nearly as strenuously as ten years ago for a new program of religious education. Men and women are saying today, "Give us your program. We believe in your objective." There is a growing conviction that we need more religious education. The question now is: How can we get it, what can we do?

The more you speculate about practical ways and means, the more you are confronted with the solemn fact that the program of the average American child is already overcrowded. All kinds of agencies, societies, and clubs have combined with the public school to mortgage every moment of the growing child's time and every ounce of his energy. Our belated attempt to penetrate his life with a program of religious education has put us at a disadvantage. None the less something can be done; a beginning must be made.

Two things have been done in my city, Dayton, Ohio, and it is of those that I have been asked to write.

The first and most obvious way we can get into the life of the American child with a program of religious education is during vacation time. The First Lutheran Church of Dayton, of which I am the pastor, has undertaken to do this in a manner that has commended itself to a considerable number of men who know a great deal more about it than we do. Six years ago we organized what we have called a Summer School of Religious Education. The public schools in America turn our children out for three months in the year, so why not make use of that time for religious training. Some parents at once raised the question whether it wouldn't be too hard on the children to insist on school work in summer or vacation time. The consensus of opinion among men who know seems to be that any child is better off in a school which has a recreational program than to run free on the streets without directed and organized activity. Six years of experience convinces us that we are doing the children no physical harm by taking them into a religious school for three hours a day, five days a week, for a month in June and July. In other words, we do have the time and can set up fairly adequate programs of religious education throughout our country if we have a mind to. I shall describe briefly our own church program.

*The Genesis of the Dayton Plan*

This project is educational. It is not an amiable plan to relieve overworked mothers during a part of the vacation period, nor is it a philanthropic enterprise to take children off the streets. It is an attempt to put religion on a par with any other fact of experience, to make it a subject of education. Our teachers are all experienced public school teachers and are employed at a salary. The principal, as well as the director of music, is from the public school staff. The system of grading and the discipline are not unlike that to which the pupil is accustomed in his educational experience. The school begins the Monday immediately following the close of the public schools on the preceding Friday. The project gears in with the public school program, at least in the mental attitude of the pupil to it.

What then is it that we study?

It is of course impossible to capture the spirit and spontaneity of a project such as our Summer School of Religious Education in a few phrases, however neat they might be. I shall not attempt, therefore, to describe the daily routine of our program of work. I shall content myself with the presentation of a few fundamental principles on which that program rests. To any one who is interested in the specific and technical working out of the program I shall be glad to furnish a descriptive folder upon request. In outlining our program of work I am quoting liberally from an article I wrote for *Good Housekeeping* for March, 1925.

*A Great Book With a Great Meaning*

We spend the first hour every morning in studying the Bible. We study it not as a textbook of science nor merely as a great literary document. We study it as a book of religion, the source of life and light, and inspiration. We believe this great Book, which has been written into the inner life of the most progressive nations on the earth, has great meaning for us. We are after that meaning.

Our aim is not to store the mind of the child with a great mass of information about a lot of curious happenings that are recorded in the Bible. We are not anxious to make out of his mind a cold storage vault full of data that would otherwise decay if exposed to God's honest sun. We are definitely anxious not to present the Bible as one more book out of which things must be learned. We do try to make the ideas and ideals, as well as the important facts of the Bible, so vivid and interesting that the pupil will be led to regard the Bible as a fascinating and helpful book. We frankly acknowledge the prime importance of "The Book" and try to come at it in a manner fitting its importance. We try to create a love for and an appreciation of the Bible in the mind of the pupil. We believe we are succeeding. At the end of our first year's school a young student of the high school grade, who is now a sophomore at university, said to me, "I never knew the Bible is such an interesting book. I spent four hours last night reading it and, believe me, it was interesting."

Our method of teaching the Bible is the oral, reproduction story-telling method. It is very simple. The teacher tells the story in her best manner, trying to make simply a great story out of it. Next day or the day after the pupil reproduces that story quite in his own words, though of course retaining the main outline of the teacher's presentation. The story is then reduced to outline form in a notebook that the pupil keeps. It is a notebook specifically designed for our school and the private possession of the pupil. Great interest is shown in the keeping of this book. Each Bible story so recorded is illustrated with a small copy of one of the masterpieces of religious art.

We spend a half-hour each day studying the life of some notable person who has distinguished himself by actually living the ideals we are taught to cherish. Our characters are selected from the mission field, the general field of humanitarian effort, social reform, et cetera. We study, for instance, in the eighth grade the life of Dr. Wilfred T. Grenfell, of the Labrador. (To heighten our interest we have twice had Dr. Grenfell as our guest.) Two weeks are spent on his biography; the other two weeks are given over to an attempt to appreciate the significance of William Lloyd Garrison.

*Dignified Hymns versus Jazz Hymns*

In the seventh grade the daily half-hour is devoted to a series of characters, including Raymond Lull, St. Francis of Assisi, James Chalmers, and others. The sixth grade divides its time between the life and work of David Livingstone and that of Booker T. Washington. Other grades have material suitable to their age.

"Idealization is the dynamic of moral conduct," Cope tells us. The child mind, and in that sense we are all children, thinks in images and not in abstract principles. Morality is learned by example a great deal more than by precept. Our aim is to present the story of these men's lives in the most vivid manner possible without any attempt at preaching. The pupil has no textbook from which he studies the character under discussion. He depends on the account given by the teacher and then outlines the story in his notebook. We hope by this process not only to teach the sound principles of right-living, social responsibility and unselfishness but also to rally the good in the depth of youth, to quicken the imitative zeal of the young.

A twenty-minute period is given each day to the study of the great hymns of the ages. We know that religion can be sung into the heart and life of childhood. John Wesley shook all England and, according to Lecky the historian, saved England the horrors of a revolution similar to the French Revolution by leading a great revival of religion in the life of his country, a very significant fact for modern times. But John Wesley had a singing brother, Charles, whose hymns were at least as important as his brother's sermons. We learned during the war the enormous power of hymns and songs to heighten morale. Frederick the Great had learned long since that a singing army is a winning army. It is that principle that we are trying to apply in our program.

It was an evil day when the church gave up its dignified hymns and started to sing what are called "gospel songs" but what are really the forerunners of jazz. We are slowly emerging from that day. I have any number of letters from parents telling me that one of their sources of gratification is to find that their children are being weaned away from jazz, seemingly by the love of dignified hymns acquired in our Summer School. The "lost radiance" of American

"Wilson's FIRST NIGHT in Paris"

WHEN Woodrow Wilson arrived in Paris to meet the Allied leaders in the World War, it made real history. Next week Huston Thompson, who was intimately associated with the President during these momentous years, will tell the story of what happened. It will be the first of a remarkable series about Wilson.

religion will be found when we learn again to sing the hymns that have been the battle cry of great social forward movements; that have sustained disheartened peoples in times of dire distress and threatening disaster. We are observing the experiment with much interest. H. Augustine Smith's excellent compilation of hymns in his *Hymnal for American Youth* is our guide to material for this period.

Thirty minutes each day are given over to the dramatization of Bible stories. The composition of the scenes, the assignment of the parts, the costuming, and the manner of final presentation are all achieved by coöperation and determined by the vote of the class. The dramatizations are later presented at the assembly period before the whole school.

From twenty to thirty minutes each day are set aside for a period of worship for the entire school. This is the most satisfactory and meaningful thing that we do. Religious education has no meaning unless it disposes the mind of the pupil to worship God. Historically understood, the gratification of the sense of kinship with the unseen is the heart of religion. You may commiserate the benighted heathen, you may hold in contempt the supposedly crude practices of the ancient pagan world, you may sneer at what you call the superstitions of sects differing from you, but fundamentally these external manifestations, these ceremonials, these mechanisms, the strings of which you think you see, are the life of religion. They are frequently traditional inheritances like some old piece of furniture from an ancestor's dwelling, which you don't exactly know what to do with but which you are not satisfied to cast away. They are at all times only the scaffolding used to erect the temple of worship in which man makes his approach to God. The aim of religious education, as I see it, is to create within the life of the child the certainty of God and to furnish him with the necessary mechanism, let us say, by which he comes to God.

To achieve this end we have turned over to the pupils a program of worship which is entirely their own and with which no adult has anything whatever to do. They conduct their own processional march in the church auditorium, they offer their own prayers, they present what might be called a combination Bible story and religious homily, et cetera, the whole service being conducted by them. The very evident delight of the children in this period of worship is convincing. Children, as a matter of fact, have no doubts. Belief in God, prayer and the worship of God, come as naturally to them as do all the other things in life. Our aim is to preserve that spontaneity and cultivate what might be called "the natural religion," which is a fact of childhood, that it may retain its radiance and sincerity when the days of sophistication come.

We do not try to fill the mind of the pupil with any theological ideas. Our children come from all denominations. In the course of the five years we have had twenty-two religious groups represented among them, all classes and creeds. Of course we are not trying to make Lutherans out of these pupils, we are not trying to give them our own particular idea about God. All we are trying to do is to arrange a medium for the natural impulse to worship. We are thereby making the fact of God a personal experience.

A word about prayer is in order. We have set for ourselves the definite task of teaching our pupils the *(Concluded on page 30)*

# Government Loses Tax Millions

*(Continued from page 4)*

difference in the tax in a single corporation of $21,438,513.69. (p. 149). Representatives of the Bureau of Internal Revenue "conceded" that these "were *made upon a basis condemned* by what was then the only published ruling on the subject" but about which "*an agreement had been made* by the engineers of the Income Tax Unit with this taxpayer whereby it was agreed *that this allowance was a permanently closed matter which would not be reconsidered.*" Yet, immediately after the Senate Committee had fully discussed the case, *its reconsideration was ordered* by the Commissioner and sent to the Solicitor "on 16 questions involving the fundamental principles involved in every amortization allowance" on which, the report states, "approximately $600,000,000 is allowed before there is any authoritative definition of the principles which are to be applied to its determination." (p. 150)

In this connection the committee also drew attention to the fact that "only the most casual examination of these subjects" could be made for the reason that there was a

> *"Time limitation upon the right of this committee to have access to records of the bureau."* (p. 195)

These words should shame every American who reads them. A Committee of the Senate of the United States, reporting the finding of gross discrimination, bureaucratic control and violations of the law on the inside of one of the Federal departments, is limited in the time the Department will permit it to examine Department records. This action was taken against a Senatorial Committee six months after exactly the same thing happened to a Congressional Committee which had similarly reported frauds, abuses and loses in other divisions of the same Department handling the Liberty Bonds these income taxes are now assessed to pay! (Cong. Record March 6 and March 10, 1925, speeches of Congressmen King and Steagall.)

***Frauds, Abuses and Losses in Other Divisions***

The charges by the Senate Tax Committee are specific. They relate to a variety of abuses. They concern many officials. *And they would not exist but for secrecy.* Many of them have been recited but these should not be overlooked:

> (a) "The invested capital of this corporation was *illegally inflated* to the extent of at least $45,000,000 for 1917, which *resulted in a loss of tax* to the Government for that year of $1,969,998.62." (p. 199)
>
> (b) "This same $45,000,000 of inflated value was included in the invested capital of *1918 after it was known to the Commissioner to be unsubstantiated and excessive, after it had been deducted from 1919 invested capital as excessive, and over the protest of" two section chiefs and "resulted in a loss of tax for 1918* of $2,506,648.56." (p. 199) (Italics are ours.)
>
> (c) "The property (referred to in last two paragraphs) was included in invested capital . . . of $90,000,000 in direct violation of the 1917 act." (p. 200)
>
> (d) "The valuation of this property at $90,000,000 was excessive by at least $45,000,000" and "was allowed to stand for 1918 by the express order of the Secretary of the Treasury (3372) of March 6, 1924." (p. 200)
>
> (e) "The committee on appeals and review allowed a value of (in 1922 in another case) $2-256 930.48 in excess of the maximum fixed by the 1917 act." This action, states the report, by "the committee of appeals and review, in an unpublished ruling and without giving notice or opportunity to be heard to the engineers who were familiar with the case and who had placed a much lower value on same." (pp. 200, 201) (The value fixes the allowance. The greater the allowance, the less the tax.)
>
> (f) "Thus," reads the report in concluding remarks in another case, "in the month of June, 1922, the Commissioner of Internal Revenue, against the advice of the solicitor, grants a refund of $3,035,771.55 . . . and in the same month publishes a cumulative bulletin proclaiming that such a thing cannot be done under the circumstances in this case. From the solicitor's memorandum (addressed to the Commissioner) it also appears that the tax on $11,500,000 of profit is also waived 'as a matter of policy' although the legality of the tax is not questioned." (p. 205)

***Their Policy to Discourage Such Protests***

*More Secrecy. What Happens if Employes Tell the Truth.*

> (g) "It has been and now is the policy of the Commissioner of Internal Revenue to discourage such protests and to make examples of subordinates who make them." (p. 225)

"Such protests" referred to several cases where integrity was crushed. Employes who would not be parties to shady transactions resigned or were discharged and other employes, who discovered fraud in the tax of the favored and sought to remedy it, saw their protests intercepted in a Division Chief's office and diverted until, at a secret meeting with the fraudulent taxpayer, a reduction from $571,492 to *$482.16* was arranged and accepted and afterward set up as a bar to prevent the collection of the fraudulently concealed tax. (Pages 225 to 229 and 2146.) About one of such cases the report pertinently remarks:

***What the Division Head Did***

> "The division head took the case away from the auditor and closed it . . . There is no way for this case to come to the attention of any higher authority unless the auditor had protested over the head of his division chief. The efficiency rating of this auditor, his chances of promotion, and liability to discharge were all under the absolute control of this division head, and if this auditor had any desire to hold his position, to say nothing of being promoted, it was necessary for him to keep quiet." (p. 225)

And in *another* employe's case with *another* Division head the Senate Committee adds:

"Mr. Briggs filed a protest against the determination of the committee on appeals and review in the X case and against the action of the conferee in the Y case . . . After the X case and the Y case were presented to this committee, they were ordered reconsidered by the Commissioner and, upon reconsideration, Mr. Briggs was sustained . . . Mr. Briggs' protests in these cases saved the Government an immense amount of tax. *He was summarily dismissed* on April 23, 1925, *IN THE INTEREST OF ECONOMY*." (p. 226)

The Senate Committee adds, further:

"This investigation disclosed the fact that the Chiefs of the *metals, coal,* and *timber* valuation sections of the Engineering Division were exceptionally capable men who have consistently tried to protect the Government from the unsound bargaining policy in the Income Tax Unit. Since the conclusion of our hearings EVERY ONE OF THESE MEN HAS BEEN REMOVED FROM THE EXECUTIVE POSITION HE HELD." (p. 226)

Still another employe, Mr. Daniel F. Hickey, attorney, in affidavits introduced by Senator Norris (Cong. Record Feb. 8, 1925, pp. 3202-8) gave examples of fraud, favoritism and collusion of which a superior admitted knowledge but plead compulsion from "HIGHER-UPS.' The following sentences are in one of the affidavits:

"EVEN THOUGH I REPORTED ABOUT A DOZEN CASES OF FRAUD TO THE COMMISSIONER, EVEN THOUGH THE INTELLIGENCE UNIT AGREED WITH MY REPRESENTATIONS, EVEN THOUGH IN SEVERAL CASES THE SOLICITOR AGREED WITH ME, THE *MEN WHO PERPETRATED THE FRAUDS WERE KEPT IN THEIR HIGH POSITIONS* AND I WAS TRANSFERRED. THEY DID TRY TO GET ME OUT OF THE WAY, BUT THEY DID NOT DARE TO FIRE ME. I RESIGNED." (Cong. Record Feb. 8, p. 3204).

Senator Norris exhibited these sentences in his plea to permit proper examination of income tax reports. The apparent purpose was to make distasteful anything which might interfere with secrecy.

But the "master's voice" had spoken. Deaf to the record of fraud, favoritism and corruption THE SENATE VOTED TO INTRENCH SECRECY.

And this Committee might also have added, had they known the facts, stated on the floor of Congress to have come from a present assistant Attorney-General, that the tentacles of the Greatest-Secretary-of-the-Treasury-Since-Hamilton have reached into the Department which has control of the administration of justice to have appointment made of those supposed to prosecute liquor cases in his Pittsburgh district and to have discharge meted out to another in this same Department of Justice because he dared to examine fraudulent Liberty Bond matters THOUGH ORDERED SO TO DO BY TWO PRESIDENTS OF THE UNITED STATES—and this, AFTER A SELECT COMMITTEE OF THE CONGRESS OF THE UNITED STATES, SOLELY ON TREASURY RECORDS AND TESTIMONY OF TREASURY OFFICIALS AND EMPLOYES, MADE A VIGOROUS PROTEST. (House of Representatives Report 1635, 68th, 2nd Sess.)

the Hebrew Free Loan Society of New York City loaned $1,185,160 without interest or other expense to borrowers in 1925 with a loss of only $1,037, or one-twelfth of one per cent. During its existence the society has loaned $17,000,000 to half a million borrowers. President Julius J. Dukas who has headed the society for twenty-one years is justified in saying that: "The society has proved that its principles are sound and that the poor are honest and will repay their obligations if afforded the opportunity to do so. We are a poor man's bank. Our profit is not recorded in dollars and cents but in the good we are enabled to do." This is in refreshing contrast to the conduct of most men who, not content with having acquired fortunes in their own business, invest in so called wage-earners' loan "banks." These banks pay large dividends to their owners, and by the use of the term "bank" the owners avoid being known as ordinary loan sharks.

---

a professor in a western college found by questioning the students in his classes that many of them believed that cheating in college examinations was justifiable when the purpose of the student was to make a mark to please his family.

All students questioned said they believed that under certain circumstances any crime could be committed without offense to the prevailing standard of honorable behavior.

A new ethical code, this, and one possibly in keeping with the doctrine of moral laxity so stridently preached by those who pride themselves on being thoroughly *modern*. But it is scarcely one to appeal to those who still cherish the old American ideals of truth and honor.

---

Shane Leslie, the noted critic, has some pertinent remarks about John Singer Sargent and his work in *G. K's Weekly*, edited by G. K. Chesterton. He says:

Though Sargent limited his brush of portraiture to the patricians and the money-makers, and to the daughters and wives suitable to their race or riches, in a sense his brush was a fierce leveler. There was no peerage in his painting and no privilege. They all had to come under his analyzing eye, his cynical penetration and his technical paint-laying. He put on his layers of paint with as total indifference to the feelings of his sitters as a bricklayer to his bricks. When he admired he laid the paint thick, and when he was scornful he did not skimp, but laid the paint all the thicker. He avenged himself upon many a dull sitter or ugly face. Paint, which is the great medium of disguise, became in his hands the servant of truth. He never hung his easel with veils. He fashioned it to the purpose of a mirror. Those who essayed to look into the mirror did at their own cost financially and at their own risk posthumously. The ladies of the Wertheimer family can never bury their salient features. Sargent painted Mr. Wertheimer as Shakespeare painted Shylock.

The Semitic tribe receive the compliment of intense trouble. Something in their remoteness and racial traits caught the grim fancy of the master, who has certainly used color to distinguish the disputed color difference between European Aryans and Jews. The Houston Chamberlains of the future will use Sargent's pictures to illustrate whatever they have to say on the race-origins of whatever the inhabitants of England may then be. But if Sargent has been impish in delineating Jews, when faced with gross and stupid Capitalism, Scotch or English, he has been bluntly contemptuous. The blundering plutocrat and the shifty alderman, who decorated Corporation rooms or their own dining-rooms seem damned before their time.

The Jews could buy his pictures but never his brush.

---

the long-sought volume of *The Northern Californian*, containing hundreds of hitherto unpublished and unknown poems and other writings by Bret Harte, has been found in California.

Some seventy years ago, Bret Harte, then in his early twenties, was a member of *The Northern Californian* staff serving as occasion demanded in the triple capacity of compositor, printer's devil and assistant editor. The paper was published weekly at Arcata, then called Uniontown. Week by week there appeared stories by "a young effervescent boyish Bret Harte, poking whimsical fun at the foibles of high and low alike."

The Uniontown of those days was the commercial shipping center from which supplies were sent to the northern mines, and through this little frontier town there flowed continually that wonderful flotsam and jetsam of the times, the miners, the traders, the gamblers and the "sky pilots" afterward destined for immortality in the pages of *The Outcasts of Poker Flat* and *The Luck of Roaring Camp*.

Thus a weather report in the Bret Harte manner: "The jar of the Heavenly Water Bearer was accidentally upset, one day last week. In the language of one of our noblest poets—'It Rained.' "

# How I Write and Why I Write

(*Concluded from page 2*)

that there were some nations on the face of the earth besides the United States.

"He had seen huge armies, great machines. He was awed by war. He had heard all his days that the United States could lick any nation on the face of the earth and do it overnight. He began to see that the United States, even with the coöperation of Britain, France, Russia, and a score of smaller nations, wasn't doing it very fast; and that there was a possibility that if the United States had been fighting alone, she might have had to take a considerable time to lick Germany.

***"Main Street" Came at the Right Moment***

"With all of these new experiences he began to think. His horizon was widened. He became self-analytical; even critical. That popular song, 'What are you going to do with him down on the farm, after he's seen Paree?' put into popular expression what I am saying.

"My book came at just that moment. Before the war, it would not have sold. If it had come a year later than it did it would not have sold; it came at just that precise moment when America was self-analytical, and looking for what was the matter with itself. That gave it its start.

"It was not to most people even an interesting book. I have found very few who have read it clear through. But, somehow, it finally got to be conversation. You had to read it to be polite. One man, a friend of mine, said to his daughter, 'Why in thunder are you reading that truck Sinclair Lewis writes?' 'Why because everybody is reading it and talking about it, and I've got to read it, Daddy.' "

"Did you, by any chance, plan *Main Street* to come at just the psychological moment?" I asked him.

"I did not. I am no genius. I could not, and did not foresee. It was mere chance that it came at the right time."

"Now tell me how you write." I begged him.

"I have told you how I wrote *Main Street*. I took twelve years to write it. At least I was brooding over it twelve years. The actual writing took about eight months. *Babbitt* took two years to write. I was planning *Babbitt* only a few years.

"I like to get off by myself when I am working on a book. I like to settle down in a hotel room in England, or Bermuda, or take a house in Kansas City, and live, while I write, as normal a life as I can.

***Hammers It Out on His Typewriter***

"I do not dictate and I do not write longhand. I hammer it out on my typewriter. I map out a town like Zenith, for instance. I had dozens of drawings of Zenith. I had every table, and chair, and picture in George Babbitt's house placed. That house was more real to me than any house I ever lived in."

"What town was Zenith?"

"No particular town. It was a composite of a dozen American cities which I know."

"But what other preparations do you make for a book?"

"I wrote a sixty thousand draft or scenario for *Arrowsmith*. Then the novel itself was two hundred and eighty thousand words. In the final draft I cut it to two hundred and four thousand. That meant a lot of real work. That first outline draft was as long as the usual detective story novel.

"On *Arrowsmith* I associated with me for a year Dr. Paul DeKruif, a scientist of international reputation. I had him by me all the time of its planning, so that I might ask him technical questions. I try to be exact in detail."

"Do you always outline a book before you write it?"

"Yes."

At present Mr. Lewis is working on a new book. It is to be a book dealing with a certain profession and a certain great institution which has come to be a vital part of American life.

I have watched him for several weeks studying that particular institution, its executives, its life. He is most painstaking. He wants to see men of every type and belief connected with it. He wants to see the freaks as well as the orthodox leaders. He wants to see the little children, the young people, and the adults. He has visited old women, women as old as ninety, and has played with the little children as young as five and six. He is the most thorough investigator and the most discriminating framer of questions that I have ever known.

He works with thoroughness and a professional intensity.

Tall, slender, nervous, red-headed, slightly bald, homely as an old shoe; but withal a brilliant mind, he is always a stimulating force. He is an incessant talker and his host is fortunate if he gets to bed an on average by one o'clock a. m. He smokes cigarets incessantly, says he drinks whenever he can get it, but carries it with poise and dignity. Liquor stimulates his conversational powers to a marked degree, but he says that it always leaves a reaction which is not good.

***Intimately He Is Just "The Play Boy"***

He has a slightly irritating manner of standing off in an English fashion and criticizing the rest of us. But when you get to know him intimately you learn that this is just "The Play Boy." He is the most wholesomely boyish man I ever had in my home. He is boy all over and through and through. He passed his forty-first birthday with me, and was more of a boy than many a man of thirty.

His mind runs like a Niagara power plant. He flashes fire and wit. He works late and gets up early, generally before his hosts are ready. He is a small-town, country boy suddenly thrust into the limelight, and, whether he will confess it or not, still has a little loneliness for "Main Street." At least, like the rest of us, he doesn't get away from a feeling that he likes to go back home—for a day at least. The stay may be short but he knows it is good to get back.

He is human. He cusses a little. It took him some time to get used to the family prayers of a preacher's home, but he seemed to enjoy them when he did.

His sarcasm bites like an icy wind, but I saw him stand up before a Rotary Club, a Chamber of Commerce, and a preachers' meeting in Kansas City and tell them what he thought of them in a way what made them like it.

When I introduced him to Kansas City as my friend, I told the various lunch clubs, churches, and literary organizations that my motto for the visit of Sinclair Lewis was this: "I may wholly disagree with every word that the gentleman says, but I shall defend to the death his right to say it."

He tells smug, complacent bishops, lunch clubs, preachers, and preachers' meetings what he honestly thinks; but he is just as willing for them to tell him what they think of him. In fact he likes it.

One girl came up to him following an address he made in my church and said, "I may as well be honest with you. I hate your books. They made me mad."

Mr. Lewis replied: "But, honey, I don't expect you to like my books. If they made you mad that is exactly what I wanted. That means that they made you think. I am glad."

This girl was a reporter on William Allen White's Emporia *Gazette*, an unusually intelligent type, and she replied: "But after hearing your general philosophy of life set forth here tonight in your address, I now understand what you are after in your books. You want to shake us out of our stupid ruts. I agree with you, for I have lived in a small town all my days!"

I have never seen Mr. Lewis when he did not take criticism in a good spirit.

He is the most volatile combination of brains and frail body I have ever seen. He is nervous, fidgety, kindly. He is a small-town man who likes more than anything else the pleasure of sitting on a bench in a garage chumming with the mechanics; or on a barrel in a grocery store, swapping stories with the village grocer, especially if that grocer happens to be a rebel.

If I am any prophet his new book will contain more T N T than all the rest of his books put together.

I have already told how he writes. Now I shall give in his own words the answer as to why he writes.

"I write because I can't help writing. I am a reporter by instinct and training. I have been a reporter all my days. I see a thing and I just report it. I write because I have a message. I hate provincialism, and I want America to get out of her provincial ruts. We have come of age. We no longer need to lean on Europe. We are developing an architecture of our own. We have become the richest nation on earth. Now let us become the most intellectual nation on earth. The best lover is the best critic. I love America more than the 'Booster' does. I want to tell the youngsters, those who are dreaming, those who would rather be research experts or poets, without hope of reward, to go on in that vision. If they are insane I am insane with them, and I find my insanity an incomparably agreeable state.

***Writes Because He Can't Help Writing***

"The scholarly attitude is a desire for knowledge without demand for a return in money or credit. It is a willingness to endure labor for the joy of it.

"We must search for beauty. Beauty, I believe, is a terrible and dangerous thing. You find it in Shakespeare, Milton, and Homer. It is in the tragedy of life. Let us cease to be figures in nice fiction—let us be mortals who face life and its dangers; who find a happiness even in its disasters."

# The Last Days of William Jennings Bryan

(Concluded from page 15)

ginning of the human family. He disclaimed emphatically any intention of campaigning the country to put God into the Constitution.

This remained with me because of an unusual incident. As the Commoner talked low but earnestly to his callers, a woman who was passing called from the fence and asked: "Do you mind if I stop and listen?"

How many millions had drawn nigh to hear what Bryan had to say!

Recollection of the Commoner and his invalid companion, in their tender interdependence that tranquil afternoon, is something to carry through the years. She included law in her college training so she could be an understanding helpmate, and she was always standing sympathetically by. There they were, growing old and gray, but like Darby and Joan, staunch and true through shadow and sun.

***Bryan's Defense of Religion and the Bible***

He was all tenderness to her in her helplessness, and she beautifully concerned as to the measure of his strength. When a group of Knoxville citizens called to get Mr. Bryan for an address, she warned them and him not to add to his burdens. All in vain, this sweet interposition. The Knoxville delegation went away with the promise of the Commoner's coming. Only they must be sure that fresh white radishes were procurable where he was to be billeted in some quiet spot in the Smoky Mountains.

Then there was the agreement to make a speech somewhere Sunday if radio-broadcasting apparatus could be installed. After that another in Nashville; more of the "Memoirs" to go to the publisher, and the closing argument of the Scopes case to be given final revision in the light of the week's developments.

That plea, fated to appear only as a posthumous summing up of the Commoner's position, separated the real issues from the misrepresentation, intentional or unintentional, that had obscured both the letter and the purpose of the law.

Mr. Bryan proposed to bring out that there was no interference with freedom of conscience. A teacher can think as he pleases and worship God as he likes, or refuse to worship God at all. He can believe in the Bible or discard it; he can accept Christ or reject him. And so with freedom of speech. He can, so long as he acts as an individual, say anything that he likes on any subject. The law does not violate any rights guaranteed by any constitution to any individual.

But, Mr. Bryan pointed out, this law deals with the defendant, not as an individual, but as an employe, or official or public servant, paid by the state and therefore under instruction from the state.

It did not have its origin in bigotry; it was not trying to force any form of religion upon anybody. The majority was simply trying to protect itself from the attacks of an insolent minority to force irreligion upon the children under the guise of teaching science. What right has a little irresponsible oligarchy of self-styled intellectuals to demand control of the schools?

Christians must build their own colleges to teach Christianity. It was only justice that atheists, agnostics and unbelievers should build their own colleges if they wanted to teach their own views or attack the religious views of others.

"Religion is not hostile to learning," Mr. Bryan contended. "Christianity is the greatest patron learning has ever had. But Christianity knows 'the fear of the Lord is the beginning of wisdom,' now as in the past, and they therefore oppose the teaching of guesses that encourage Godlessness among the students.

"The science of how to live is the most important of all the sciences, but it is necessary to know how to live. Christians desire that their children shall be taught all the sciences, but they do not want them to lose sight of the Rock of Ages while they study the ages of the rocks; neither do they desire that they will become so absorbed in measuring the distances between the stars that they will forget Him who holds the stars in His hand."

The Commoner, now showing the scant locks and the furrowed lineaments of the worn warrior, but seemingly good for many more battles, felt that he must go on in a cause that had come to possess his whole being as the crowning crusade of his toilful 40 years. He must write, he must speak, he must counsel, he must confer, he must plan, even if this exhausting stay in Dayton foreshadowed what he was prepared to suffer, if need be, namely, martyrdom. Ready to offer himself in the same vicarious spirit that impelled exposure to the adroit Darrow's unsparing shafts as he went voluntarily to the witness stand for his God and his Bible.

Darrow's atheism was set down by the Bryans as more sweeping than the doubting of Ingersoll. For did not the eloquent infidel say at his brother's grave: "For in that night of death, Hope sees a star, and Love, listening, can hear the rustling of a wing"?

I quoted another part of that funeral oration to further illustrate Ingersoll's questioning: "Every cradle asks us whence? and every grave whither?"

But neither made any comment.

But the solemnity of the moment moved the Crusader to a self-revealment that, he said, would sound better after he was gone. Although convinced that the end would come quickly in his case—he had confided to friends in Detroit a year before the premonition of death from the bursting of a blood vessel while on the platform—how little he realized this confidence would be released in ten days!

***Made Each Step a Matter of Prayer***

What he confided was that he had made every weighty transaction of his life a matter of prayer to his Maker before entering upon it. Even his first speech in Congress, which caught the attention of the nation, had been taken to the Lord in the sacred communion of the closet.

It brought up the image of Chinese Gordon, brave British commander in the Sudan, carrying a Bible always, as well as a sword. It recalled the lonely Lincoln, saying that the consciousness he had no other place to go in the nation's extremity brought him upon his knees before his Maker. It answered the question of many of the Commoner's close friends: "Why does he take up the cudgels at Dayton in such a dubious cause?"

At that moment it was written in his will, executed just before leaving for Dayton, in connection with a gift of $100,000 for Christian education, that while he devoted a large part of his time to study and discussion of political questions and had found abundant reward in the reforms adopted with his humble aid, he felt more interest in religion than politics because religion is the only influence that controls the heart, out of which are the issues of life.

The lament of Wolsey, "Had I but served my God with half the zeal I served my king, he would not in my old age have left me naked to mine enemies," had no relation to the Commoner's consecrated and fruitful life. Paralleling his domination of Democratic councils for 30 years, had been his Presbyterian eldership, his Bible class leadership and his powerful spiritual appeals from the platform. He had served God, country and party with equal zeal.

But at the last he seemed on the threshold of a single consecration. Democracy was to go that he might give his ebbing powers undividedly to orthodoxy. In the half-day we had together at Dayton, not a name or word or incident came up out of all the vivid and stirring scenes in which we had chanced to be associated throughout three decades as party, platform and newspaper associates.

***And So It Was Until the End Came***

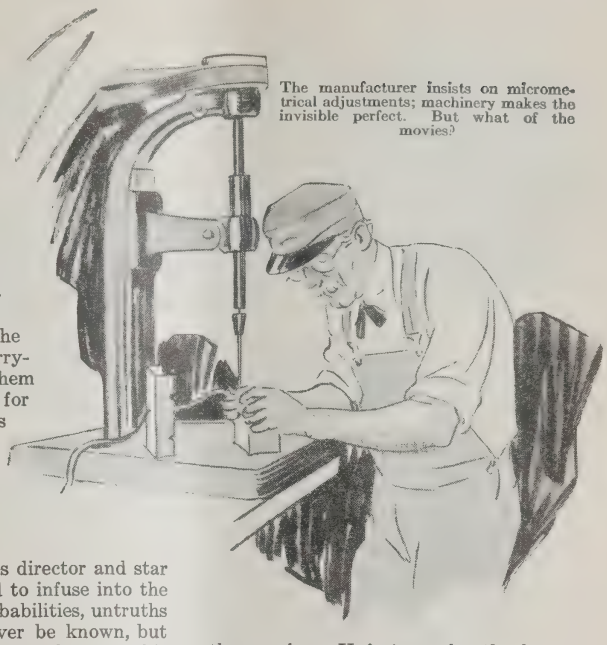
It will be remembered that he released his supporters from obligation to him as aspirant for the United States senatorship from Florida because he felt disinclined to continue his activities in politics. At the conclusion of the last Presidential campaign, he announced retirement from the lecture platform to devote his time to the writing of his "Memoirs" and to other tasks.

Then came what he believed in his soul to be a covert organized attack in the name of science upon the Christian religion, and he hastened to Tennessee as the volunteer and uncompensated assistant to the state prosecutor.

Following his success in that trial, he was planning to go to the country with the issue raised by the scientists, atheists and agnostics. The powerful voice was to be heard in the ringing affirmation: "The Bible is good enough for me."

Then beyond that loomed the crowning oratorical experience of his unexampled platform career—the series of uplifting addresses in the far-away land where Christ and the Twelve spake.

So at the moment of our parting there appeared little prospect of the enthralling Bryan advocacy being longer divided between Christian faith and political philosophy. The Cross alone had won the field.



A few days later at Sharon Lodge, in the Blue Ridge Mountains of Virginia—his father's native state, which never deserted him in his political struggles—I got the message that the Happy Warrior had passed away without pain in his Sunday afternoon siesta.

The lines of one of Macaulay's "Lays of Ancient Rome," which Mr. Bryan once said he wanted for his epitaph, came to me—

"And how can man die better
Than facing fearful odds,
For the ashes of his fathers
And the temples of his Gods?"

# Is a Movie Renaissance Possible?

(*Concluded from page 5*)

The manufacturer insists on micrometrical adjustments; machinery makes the invisible perfect. But what of the movies?

A newspaper reader will feel sore at everybody because he has just spent a dollar to see a movie worth 3 cents and 17 minutes of time; this reader will call it every name possible. But if the editor publishes a diatribe one-fifth as bitter as this reader's, the latter will at once embark on a mental scalping mission. One reader —a hundred readers; one town—a hundred towns. Editors could overlook inconsistent individuals and communities, but in the course of years it has been found that few readers want criticism unless it agrees with their opinions.

So we have mild reproaches or preposterous praise in the press. To readers is left the delightful monopoly of excoriating and attacking.

It is true that in many cases advertising patronage and other *sub rosa* interests cause editorial policies to be shaped in accordance with bank-roll ethics. But do the communities in interest object? Do they kick? No. When the local arts club or its counterpart gives its monthly meeting one of the principal guests is the dramatic-musical-radio-movie "critic." No matter what kind of merry ha-ha's greeted his recent contributions, he—and sometimes she—is given the opportunity to explain whys and wherefores, and the meeting adjourns like all well-regulated mutual admiration societies.

The Will H. Hays organization is a costly superstructure which merely adds to the amusement expenses of the nation. It has no effect upon the deep-rooted ignorance of producing organization units, of self-advertised supermanagements.

A manufacturer interested in his product is not satisfied with normal, visible perfection. He insists on micrometrical adjustments. Draftsmen and machinery are employed to make the invisible perfect, and if superexactness is required new and costly precision adjuncts are resorted to.

There is no reason why movie producers should not be equally careful. There is no reason why they should not employ means and individuals that would correct the glaring faults first, the ordinary ones afterward, and finally adopt standards as precise, in every sense of the word, as a billion-dollar industry merits.

The correctness of the butler's matutinal attire is unchallenged.

To what an extent the practice of directors marrying stars and featuring them directly is responsible for the blah and bunk is neither here nor there but it is significant that such teamwork, often ending in divorce courts, is commonplace. To what extent the pairing enables director and star to do as they please, and to infuse into the picture extraneous improbabilities, untruths or superfluities, may never be known, but my observations are that wherever this arrangement exists the production suffers. I have even noticed it where "trades" were obvious. When a certain director's wife stars under another director the latter governs himself accordingly, because his own wife, if he has one, may require similar attention. Reciprocity knows no bounds —and the public suffers.

Vincent Astor, in an interview in *Collier's* denied that there is any longer such a thing as "high society." He said that the notion is based on "Hollywood interpretations of the luxurious laziness of the so-called Four Hundred."

Mr. Astor must have seen a few movies. Very likely he has seen those which featured the kind of society where butlers serve breakfast in evening dress. A five-dollar bill to any butler in or out of a job would be sufficient to buy pointers from him, one of which is the *faux pas* just described. But is it conceivable that a superdirector, fifteen years removed from peddling, would stoop to get knowledge from a waiter? How can the public ask a $2,000-a-week genius to be taught details of the sort by a worker whose services are rated by employment agencies at, sometimes, $100 a month?

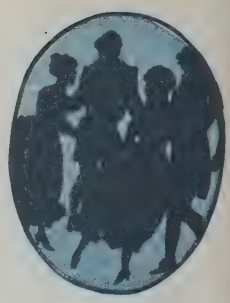
Maizie McMickey, Becky Willettstein, and Nita Bellini, who work side by side at the notion counter of the big department store, are not going to question the butler's matutinal get-up.

Yet let an Irish cop appear on the scene, and if there is something a wee bit wrong Maizie will resent it; if the secondhand shop scene is not just so Rebecca is going to snicker, since her "old man" has owned a successful one for a generation and she was virtually raised in the midst of slightly used art goods; while Nita will flash a sneering glance if the peasant scene is defective.

The movies are highly commercialized, but that is not a fault. The fault is the *excessive commercialization of ignorance and vanity* as repsented by those who make the movies. Unfortunately, the box office tells nothing. Even a bad movie will make money.

I do not believe that the domestic problems of movie folk are news, in any sense of the word, any more than those of the traffic policeman, the ice man, the doctor. If organizations can prevail upon newspapers and newspaper associations—notably the Associated Press, and similar bodies—to refrain from featuring items of that sort a step in the right direction will have been taken. If something nasty happens, publish it fully, as in the case of any other individual, to the extent that the community and taxpayers are interested.

Producers were quick to discover that the star plan had its objections, its drawbacks, its losses. What stars of ten years ago are stars today? The system was modified, little by little, and in turn stars modified it themselves by their own organizations.



Though I have blamed the director for most faults, since he is the court of last resort in picture making, I do not wish his elimination. Most stars who have acted as their own directors have failed dismally; authors who have ventured forth to stage their stories have clearly revealed how they suffer under the screen's direct proof. We can excuse the director; he is a creature of the industry and has not had the opportunity to learn everything despite his practical success; we may find for the actors, who have been accustomed to management and therefore relieved of framework detail, but for the author, there are no alibis. He or she either knows or does not know. And if they don't know they have no business writing.

Briefly, even royalty, after generations of usage, finds it essential to maintain etiquette by means of masters of ceremonies, social secretaries and other means, to guard against *faux pas* and prevent mistakes. But the movie industry, more important than all the combined royalty of thirty centuries, expects itself to be royal with no safeguards of any kind except a censorship against which it balks and which is useless as well as banal.

Isn't it time for producers to call in means by which the preventable defects and the regrettable mistakes can be eliminated outright? And throw overboard the grotesque and costly staffs of ignorance now hanging on?

# A Dance a Week

## *Money Musk, Pop Goes the Weasel, and St. Patrick's Day in the Morning*

The tune "Monymusk," to give it its original Scottish spelling, was composed by Daniel Dow, a famous fiddler and musician, who was born in Perthshire, Scotland, in 1732, and died in Edinburgh on January 20, 1783. He was a teacher and giver of concerts in Edinburgh from 1763 till his death. Dow published various collections of Strathspeys in one of which "Monymusk" appears under the name of "Sir Archibald Grant of Monymusk's Reel," probably about 1770. Sir Archibald and Lady Grant were great favorites in Edinburgh, and out of compliment to them the tune was called "Monymusk," being the name of their estate in Aberdeenshire. The village of Monymusk is on the banks of the River Don, about twenty miles from the city of Aberdeen.

Another popular contra dance that has met with much favor for many years is "Pop Goes the Weasel," a description of which we are giving this week to our readers. The music bears the same title.

### MONEY MUSK

Six couples in a set. Give first call before the music begins.

First couple swing once and a half around..... 8 bars

First couple advance, give right hands, and turn once and a half around and stop, the gentleman between the second and third ladies, and his partner between the second and third gentlemen. Both are now in opposite lines.

Forward six..... 4 bars

Gentleman who is standing between two ladies will join hands, while his partner who is between two gentlemen will also join hands, and all move forward four steps, and back four steps.

Swing three-fourths around..... 4 bars

The same lady and gentleman join right hands and turn three-quarters around, so that they finish between the lines, the lady facing toward the head of the set, her partner facing her and toward the foot of the set.

Forward six..... 4 bars

The lady joins left hand with the gentleman on her left, and right hand with the lady on her right, forming a straight line, facing toward the head of the set. The gentleman joins right hand with the gentleman on his right, and left hand with the lady on his left, all facing the opposite three. All forward and back.

Swing three-quarters to place..... 4 bars

The same couple join right hands, swing three-quarters to their own side of the set, one couple below, where they started. This leaves two ladies together and two gentlemen together.

Right and left..... 8 bars

The same two couples pass through to opposite side of set, each give the left hand and turn. Return to place in the same manner.

The same couple continues the dance, progressing toward the foot of the set, casting off one couple each time, continuing until all couples have gone through the movements. After the first couple has danced by three couples, the couple then at the head begins. There are now two couples leading at the same time. To end the dance call,—All join hands forward, turn partners, promenade to seats.

### A GOOD EXERCISE FOR THE KNEE JOINTS

One who sits at a desk all day, or rides in an automobile, or lacks opportunity to use the muscles of the limbs to any extent, cannot expect to dance as well as a more active person.

One reason is, that cords between the thigh and knee tend to shorten when they are deprived of proper exercise. This can be overcome by the simple physical actions here described. The joints of the knee are of supreme importance in the execution of the steps of the dance. The following exercises will lubricate and strengthen not only the joints of the knee, but also the muscles and joints of the toes, ankles, and hips.

THE EXERCISE—Stand feet together, weight entirely upon the right foot.

Count one—Bend right knee, and at the same time, slide left foot out to side.

Count two—Raise and draw left foot to right.

Count three—Down with foot and slide left to side again.

Count four—Raise and draw left foot to right again.

Do this eight times and then take the opposite foot for the same number of times. The body should be lowered about six inches when the knee is bent. Another useful exercise is to stand, feet together, raise leg upward, knee bent, toes pointing to the floor, lower and raise again. Repeat this several times, then exercise opposite leg.

One does not realize how little control the average person has of the muscles of the limbs until one begins to dance. Persons who can walk, run, move up and down stairs, find it difficult to control the muscles or joints in any given position for an accurate length of time, as is required in dancing. The above exercises will be found very beneficial, whether or not one dances.

### POP GOES THE WEASEL

Metronome 112. Six couples in a set. Call first change before music begins.

Head couple down the outside and back..... 8 bars

Head lady and gentleman walk down the outside of their own line eight steps and return to place.

Down the center and back..... 8 bars

The same couple join inside hands, and promenade down to the foot of the set, eight steps, then change hands, and return to place, eight steps.

Circle three hands around..... 8 bars

The same couple join hands with the next lady, and circle three hands once and a half around, the second lady stopping opposite, and facing her original place. At the word POP in the music, the active couple release the hands of the other lady, at the same time raising their own joined hands, forming an arch, under which she passes, and returns to her own place.

Circle three hands around with gentleman..... 8 bars

Repeat the same with that gentleman.

Repeat all, going below one couple each time. The other odd couples 3-5 begin the dance at the same time and continue until the end of the set is reached, when each couple rest one repetition of the dance. The same applies to the head of the set. To end the dance call,—Join hands forward, swing partners, promenade to seats.

### ST. PATRICK'S DAY IN THE MORNING

Six couples in a set facing. Call first change before the music begins.

Head couple down the outside and back..... 8 bars

Head couple down the center and back..... 8 bars

Cast off, forward and back six..... 4 bars

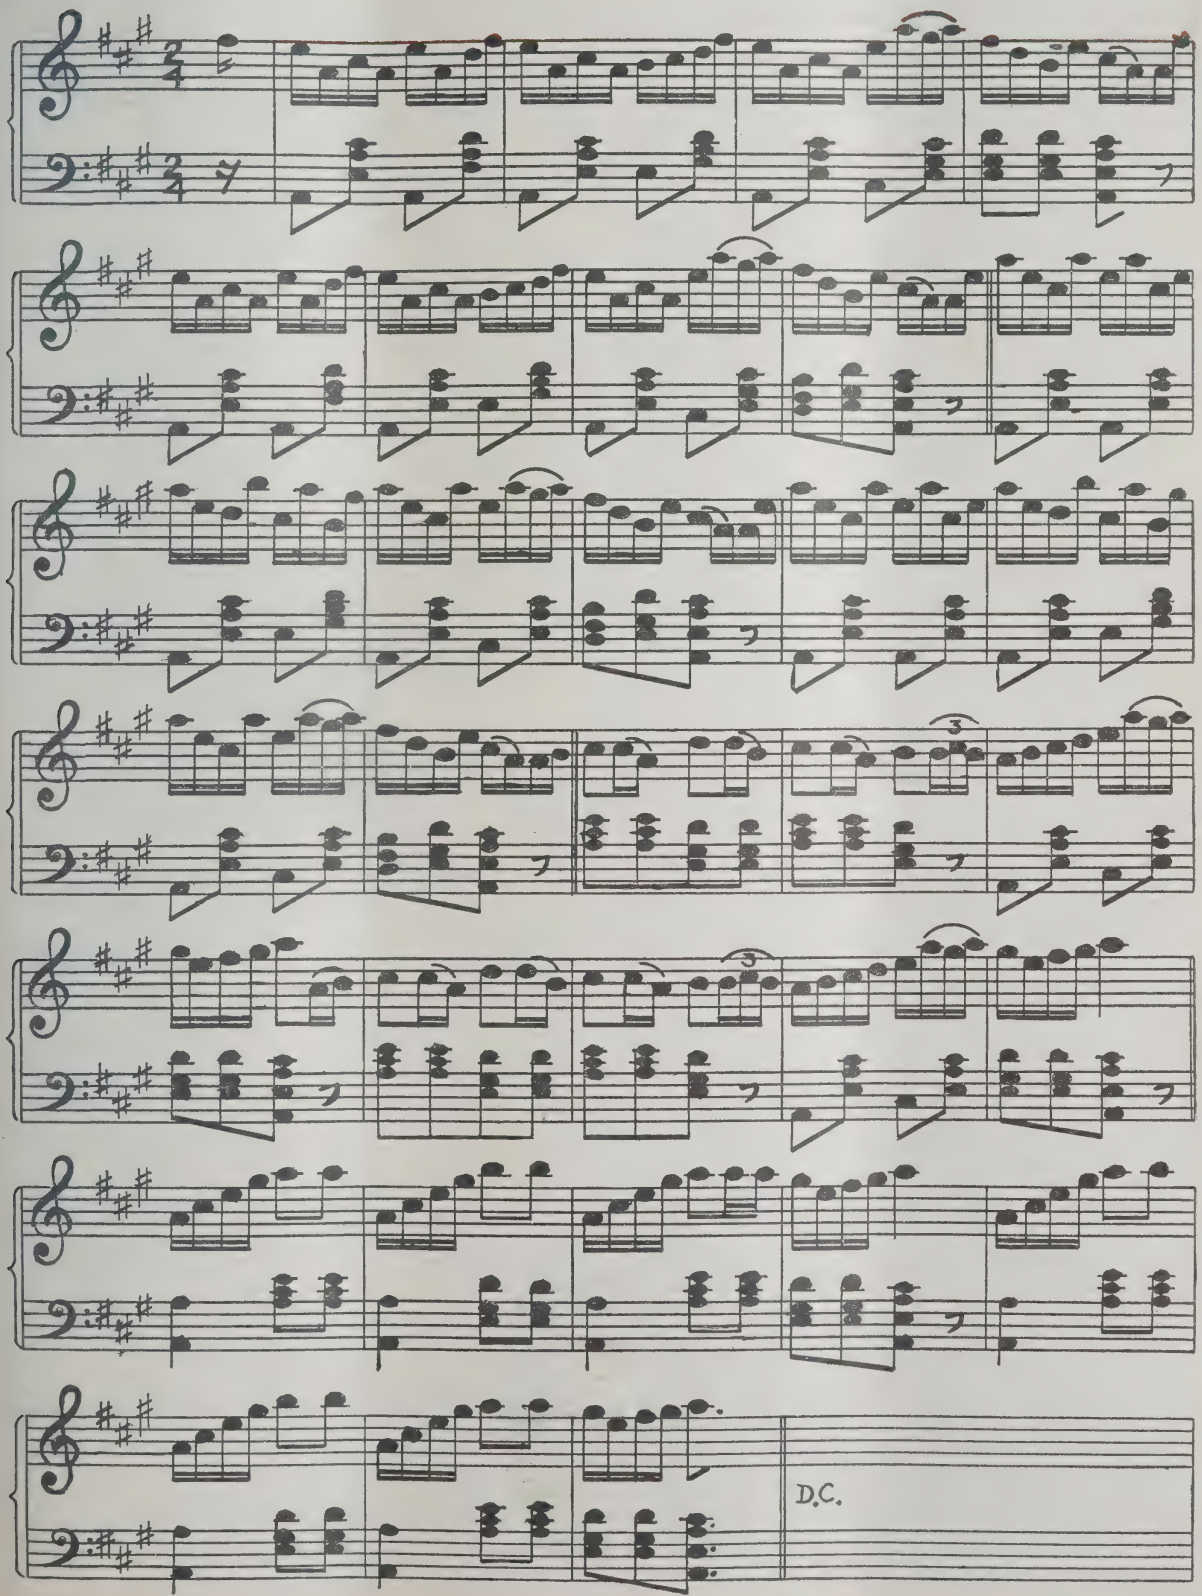
Cast off, means to go below one couple.

Six hands half around..... 4 bars

Forward and back six..... 4 bars

Six hands half around to place..... 4 bars

First two couples cross right hands half around..... 4 bars



Left hand back..... 4 bars

Ladies chain..... 8 bars

Play six times. To end the dance call,—"All join hands forward and back. Turn partners, promenade to seats."

# MONEY MUSK

MM—112

# Astor Fortune and Captain Kidd's Gold

(*Concluded from page 8*)

stead found that, preceding the year 1802, Astor's annual bank deposits ranged from $200 to $600, and that they were returns from the marketing of his furs, as notations on the deposit slips explained. This was the period at which John Jacob was supposed to be laying the foundations of the Astor fortune in the fur trade, but there was not much indication of any future fortune in the amounts laid by each year by the fur-trader.

"In 1802, however, the maximum of $600 a year leaped all at once to $1,400,000, deposited to John Jacob Astor's credit. Accompanying this deposit was a notation that it covered 'French and Spanish gold coins,' and 'considerable jewelry.' Intrigued by his discoveries, Olmstead then crossed the Atlantic, and, searching in London, found the records of an old jewelry firm, still in business, which showed that Astor had been paid, in 1802, the sum of $1,400,000—the same amount deposited in New York—for French and Spanish coins and jewelry. Thereafter, there was no similar sale by Astor, and no deposit of similar size in any bank of which record can be found.

"It was finally discovered," continued Dr. Bolton, "that the cross on the cave had led Cartier to the discovery of the chest filled with the 'Spanish and French coins and considerable jewelry.' Astor, who had been in the habit of trading with the trapper for his furs, bought the chest and its contents for $5,000, according to further records found by Olmstead. Jewelry, notably a pair of bracelets, which had been taken from a Lady Dunmore, while she was honeymooning with her husband on board a British ship, by Captain Kidd and his men, were found among the treasures sold in London by Astor, according to another and later Lady Dunmore of Olmstead's day. These bracelets eventually were returned to their owner, but they assisted in establishing the chest as having been buried by the famous pirate, or 'gentleman adventurer,' as one prefers to consider Kidd.

"When Captain Kidd was hanged at Execution Dock, London, in 1701, on formal charges of having murdered a member of his own crew, and of piracy on the high seas, he handed to his wife a paper on which were written in his own hand the figures 44286618. Olmstead's curiosity was further aroused by these figures, and was oddly appeased when a relative of his, an engineer, took the location of the cave and found it to be latitude 44 degrees, 28 minutes, and longitude 66 degrees, 18 minutes —44:28; 66:18—the number which Kidd had passed to his wife so that she could find the location of the spot in which something of value was buried. That which the pirate intended her to find from record, the trapper found by accident, and, being unable to dispose of it, sold it to John Jacob Astor for about one three-hundredth of its value.

"The chest which had held the treasure was found by a member of the Olmstead family in the hands of a Vermont junk dealer, and, on being carried to the cave, was found to fit perfectly into the hole which had been carved in the floor of the cavern. Thus, one by one, the links in the chain of historical evidence as to the source of the Astor fortune were forged and a true story more strange than the vast majority of fiction plots was brought to light after two centuries."

Hidden treasure, whether buried by pirates or persons who came by it honestly, has cost more money spent in hunting it than the value of the treasure sought, is the opinion of Dr. Bolton.

"Captain Kidd's treasure," he said, "probably has occupied more attention, cost more money, and been hunted more frequently than any other. From Cocos Island to Sleepy Hollow, men have hunted Kidd's hoard, and the body of the beheaded negro whom Kidd is said to have buried with the treasure. Legend declares that this unfortunate black man was the one selected by the pirate to help him bury the loot, and that this assistance was paid for by death to the man. The skeleton of a beheaded negro, the skull resting on the chest, was uncovered some years ago by laborers working near the André monument in Sleepy Hollow, but no further search is recorded as having been made there for treasure."

Rye, New York, also has its Kidd legend, the tale going that a strange man, garbed in accepted piratical costume, begged shelter one stormy night from a farmer's wife, whose apron he filled with pieces of strange gold the following morning. The mysterious stranger, who immediately disappeared is said to have been Captain Kidd.

From Great South Bay, Long Island, comes down to us the story of the fisherman, who dreamed seven successive nights of treasure trove, buried at a spot the fishermen knew well. At length he took his boat and rowed to this point, but the following morning he was found lying across his own doorstep, unconscious and nearly dead. His spade, the handle marked with his initials, and with wet sand still clinging to the blade, was found some days later in a graveyard, several miles from both the fisherman's cottage and the point where he had dreamed the treasure was buried. The fisherman was unable to give any account of his movements after he had landed on the point.

Nearly every Atlantic port, and many of the coastwise villages have their legends of Kidd and his buried treasure, but more matter of fact investigators, some of them very famous historians, indeed, have declared that Captain Kidd never buried any treasure whatever; that what he took he spent for his own enjoyment, largely on wine and women, meanwhile furnishing the song himself. But now comes Dr. Bolton, whose books on the olden days of America are classics, with the seemingly well-substantiated word that Kidd did bury his treasure, but that it was found some two centuries ago, by one who with it laid the foundations of one of the greatest fortunes of the modern world.

# Giving Back the Bible to Our Children

(*Concluded from page 23*)

art of personal prayer. The popular American vice is to do things by proxy. Most of our games are played by people who are payed to play them while we sit in the bleachers and look on. We play by proxy. It is literally true that most of us do our praying by proxy. We have undertaken to cultivate the art of individual prayer and to develop a habit of participation rather than the "bleacher attitude."

After five years we have a group of young men and women, some of whom are now freshmen and sophomores in college, others are in high school.

The method by which we aim to teach the art of prayer is simple enough. We secure from each child the first week of school a prayer that he has written without having had preliminary warning. The various classes then severally combine their prayers into what has been called a "composite prayer." This composite prayer is true to the ideas and language of the child and becomes the class prayer. Each pupil learns it. They use it in unison frequently in the morning at the beginning of the day's work. Many of the smaller children, I am told by parents, use the prayer in the home at bedtime. Some of the prayers we get are gems of sincerity. The important thing about training in prayer is not the specific prayer made but the development of a habit of praying. America needs not so much "prayers" as "pray-ers." We are trying to develop "pray-ers."

One day each year is set aside for the carrying out of a program of service. Each class selects the special object of its interest and then plans some deed of helpfulness to be done. The lower grades usually take toys and candies to the Day Nursery. The Crippled Children's Home, the County Orphan's Home, the Widow's Home, the Soldiers' Home are all visited by the pupils, where they bring either entertainment, gifts or some token of thoughtfulness and cheer. At the same time each grade sends a token of appreciation to workers away from home. Thus one grade sent several hundred books to Tuskegee Institute, another a gift of money to Dr. Grenfell. We hope in this manner to relate precept and practice in a vital way.

The main significance of a project like this at the First Lutheran Church, Dayton, turns on the fact that it is a dramatization of a feasible program of religious education. We are showing that children will respond to our kind of a program of religious education. Religion is interesting to them when properly taught. It is work, hard work, three hours a day in the summer time, but our pupils do it. Our church is a downtown church: nearly all our pupils live some distance from it, some from six to ten miles away, yet for five years our enrollment has exceeded two hundred and twenty-five with an average daily attendance that ran this year 93.5 per cent. The enrollment of the public school with compulsory attendance probably cannot equal that

# Perhaps the First of American Cities

(*Concluded from page 7*)

*solidly build house* originated in this Lost City of Nevada.

Archeologists studying this ruin and the artifacts found within it have learned that here in the midst of what is now largely desert, but apparently once much better watered and more heavily grown up to vegetation, these first builders irrigated and farmed the lowlands, producing beans, corn and squashes. They gathered mesquite beans and screw beans on the surrounding hills. They produced a good grade of cotton in the valleys and from it wove clothing of about the texture of our cheesecloth. Fragments of this cloth, found in the graves of the Lost City, still retain colors—red and blue and purple

***The People Were in the Stone Age***

—applied by means of vegetable dyes, made we know not how. Fur cloth also was produced, by cutting the skins of rabbits and other animals into long, narrow strips and twisting them, after which they were woven into blankets. Even more interesting, and probably more valuable in the economics of life in *Pueblo Perdido*, was the feather cloth, made by first twisting fiber of wild plants into slender strings, which were wrapped in the down from the breasts of birds. This "yarn" was then woven into blankets, light and beautiful, yet warm and protective from the cold. Feather cloth similar to this was made in the Nahua Empire, under its Aztec rulers, in the Vale of Anahuac—the present Valley of Mexico—and a still more valuable robe, limited to the use of the Aztec nobility, was made from the skins of humming birds and other brilliant-plumaged winged wanderers of the jungles. But the fact that these people of the Lost City, who doubtless settled in what is now Nevada some centuries before the Christian Era, knew or evolved this feather-weaving is of the utmost value in determining the age of their civilization.

The people of the *Pueblo Perdido* were in the Stone Age, as demonstrated by the presence of arrowpoints, knives and drills made from flint and by stone grinding slabs for corn, similar to the *metates* in use to this day by Mexican Indians. Strangely enough, no stone axes or grooved hammers have been found in the ruin. Possibly this is an indication that the people were either so isolated, or so well protected by surrounding deserts that they never went to war. Perforated beads of shell and turquoise, nicely rounded and well-drilled, compare with the chipped flint arrowheads and knives in excellence of workmanship. The tur-

***Pottery Which Opens Book of the Dead***

quoise probably came from the ancient mines on the Colorado River, while the shell must have been obtained from the Gulf of California, or from the Pacific Coast, either one of these sources being hundreds of miles away. In all probability they received these "raw materials" through intertribal traffic, or by traveling traders—there is no means of our ever knowing which.

But it is the pottery found in the Lost City that really opens this New World "Book of the Dead" to our eyes. Indeed it was from this pottery, found in myriads of fragments in the rooms and in scores of whole vessels in the graves, that the city was first thoroughly identified as having been built by the ancestors of the present-day Pueblo Indians. This pottery, also, has added confirmative testimony as to the age of the ruin. Dr. A. V. Kidder, a leading authority on western and southwestern peoples, divides the prehistoric record of these tribes into periods—first, that of the basket makers, who flourished about 2,000 years before Christ, who had learned to raise corn and squashes, but were ignorant of pottery and house-building; second, the post-basket makers, to whom is attributed the invention of pottery; third, the pre-Pueblo period, when the people developed the types of pottery we now call "Pueblo," and raised corn, beans, squashes and cotton, wove good cloth, but still lived in pit-dwellings; fourth, early Pueblo, in which houses of two or more rooms were built, and pottery materially improved; fifth, the greatest period of Pueblo pre-history, when the huge communal houses were built of stone, marking the highest development of communal civilization in America; sixth, the late prehistoric period, when the beginning of the decline of the Pueblos appears to have set in; and seventh, that period from the middle of the sixteenth century down to today, starting with the conquest of the Pueblos by the Spaniards.

In this scheme, which is considered by authorities to be correct, Mr. Harrington places the buried city of Nevada about the close of pre-Pueblo (third) period, or the beginning of the early Pueblo (fourth) period. This was probably about the time of Christ; possibly some centuries earlier; exactly, it may never be known, but the

***They Learned to Build and Weave***

evidence of the pottery discovered in the *Pueblo Perdido* supports Mr. Harrington's idea. "Plain pottery, usually black, is very abundant in the ruin," said Mr. Harrington, "but this furnishes little clue to the identity of its makers. It was only when we had obtained examples of bowls and jars of white and gray and rich red color, on which tasteful designs had been drawn with black paint, and had, in addition, discovered pottery in which the decorations were worked out by varied corrugations of the outside surface, that we were able to say definitely that the 'Lost City' was built and populated by Pueblo Indians.

"Taking the pottery as a whole, while its resemblance to Pueblo ware is unmistakable, there are certain characteristics which stamp it as belonging to an early period of Pueblo history. Literally thousands of fragments of this pottery lie scattered about the sites of the old houses, and these, with the whole vessels frequently found in the graves and occasionally in the rooms, are proving of great value to our study. It was by their means that we were able to identify the ruins as Pueblo in the first place, and in fixing the exact period to which they belong. We are now virtually certain that here in the valley of the Muddy River, 2,000 or more years ago, the ancestors of the modern Pueblos learned how to build permanent buildings, to weave fine cloth, to make good pottery, to develop irrigation systems and improve their agriculture, in short, developed the arts which, in after years, made the civilization of the Pueblos one of the highest in ancient America north of Mexico."

The walls of the houses so far excavated in *El Pueblo Perdido* are almost uniformly seven inches in thickness. At first, this uniformity of thickness may seem peculiar, but it is probably the result of the fact that the normal spread of the hand of a man of the size of the present-day Pueblo Indian averages seven inches. Probably in placing the adobe and stones in the wall, this width was unconsciously attained and maintained by the workman. The diagram published herewith shows House No. 2 excavated in the Lost City. It is a house of seven connected rooms, and three other rooms, or buildings, all circular, which may have been

***Fireplaces Where Cooking Was Done***

either storage houses, watchtowers, or small forts. Three fireplaces, each of them seventeen inches in diameter, provided for the communal cooking, and probably also heat for meetings of the people who lived in this large house, comparatively large, yet only one-third the size of the twenty-one room, one-story house also unearthed in the Lost City. There are indications that the figures labeled 6, 8, 9, and 10 may have been watchtowers or small forts, guarding this part of the *Pueblo Perdido*, but the absence of weapons of war from the ruins would indicate that they may have been storehouses for corn, beans, dried squashes or the seeds of the mesquite and screw-bean trees growing wild on the surrounding hills.

Rabbits, deer, mountain sheep and probably ground squirrels furnished the meat supply of these pre-Pueblos, who evidently had no domestic animals except the dog. In the main they seem to have lived on vegetables, since bones of animals are far from numerous in the ash piles, fire pits and kitchen middens around their homes. As a matter of fact, the diet of many of the southwestern and western tribes in what is now the United States was largely vegetable, as it was of the so-called "building Indians" farther south. Even today, the food of the Mexican Indian in great part consists of corn, beans, squashes and the fresh wild fruits of the jungle, yet many of these Indians live to abnormal ages and carry perfect sets of teeth to their graves.

The dead of the people of the Lost City of Nevada were buried in pits, some of them in sitting positions, the chin resting on the knees and the arms either hanging at the sides or folded across the chest. Pottery

***There Came the Need for Better Homes***

bowls of large size were found intact in most of these graves, and this leads to the opinion that food was buried with the dead, a very ancient custom, possibly responsible for our placing flowers on the graves of our relatives and friends.

Certainly this city was founded a very long time ago, probably by a migrant tribe who here met the proper conditions and the opportunity to develop the more sedentary arts of agriculture, pottery-making, dyeing and weaving. With the development of these arts came the need for permanent homes, with the result that in the heart of the great western desert was built, not only the first city, but the first house in what is now the United States.

# An Olden Quilting Party

By GARETTA HATCH PIERCE

IN THE days when motion pictures and automobiles were undreamed of, when books were not so plentiful as now, when many of the necessities as we know them today were inconceivable luxuries, there prevailed an excellent custom for making work an amusement, for fostering a spirit of helpfulness that tended toward comradeship, and helped to destroy that loneliness so common in the isolated pioneer homes.

It was the custom of "bees," in which all the people of the countryside joined to perform the work of some neighbor. There were the "raisings," when a house or barn of logs was to be built. There were the logging bees, when trees were cut and hauled from a piece of land, thus preparing it for cultivation. People from miles around would gather at the spot; and many hands made light work and cheerful hearts. And when the task was finished there would be feasting and frolicking, games or dancing.

There were paring bees, when apples were pared, quartered, cored, and strung from rafters, there to be dried by the heat from the glowing fireplace; husking bees, in which the farmer's crop of corn was husked and stored in capacious cribs; threshing bees, still held in some parts of the country; wood bees and bridge bees, where many accomplished easily what one could not do alone; and within the homes were sewing bees, for sick neighbors, perhaps, or for the needy of the district.

And then there were the quilting bees. As long as old-time quilts are used to grace and beautify beds, just so long will the memory of these bees remain. It was a slow task to transform countless bits of calico into a quilt of varied patterns, a thing of beauty and taste, but it was a loved one, for therein lay almost the sole outlet for the artistic genius of the countryside. Many are the treasures of this art still in existence, and art it surely was.

* * *

A quilt was to be made for the minister. Weeks of preparation preceded the bee. Each woman pieced a block according to her means and skill (and, wonder of wonders, they were all nearly of a size when joined together in a medley of figures like the vagaries of a turning kaleidescope, but mathematically square). There was some discussion as to whose block should occupy the most prominent place, and ultimately it was given to the daughter of a ne'er-do-well who gave promise of a brighter life. Next the lining and cotton must be bought. A committee of three was chosen, and a trip taken to the next town.

* * *

At last the preliminaries were completed—the lining, batting, and cover fastened on the frame—and the ladies all assembled for the quilting.

Each brought a basket, a contribution to the feast which was the most important part of the day's doings to us children.

ALL the early American quilts were named. Hence we have such names as The Coach Wheel, The Flower Pot, The Tulip, The Oak Leaf, The Snake Fence, The Log Cabin, The Crow Foot, The Star, The Rising Sun, The Irish Chain, The Nine Patch and scores of others. There are such unique names as Robbing-Peter-To-Pay-Paul and The Old Maid's Dream. The former is an ingenious design in which a part of one figure is carried over into the next to complete it. The significance of the latter name is obscure. But whoever it was who dreamed its intricate design and splendid colors and then executed the work assuredly had a flair for beauty.

One woman brought two pyramids of butter, shaped like two huge pineapples, the sides covered by fluted leaves. There were "ris" biscuits, friedcakes with the traditional hole in the middle, doughnuts like twisted ropes piled high, fried chicken, a boiled ham, cookies, innumerable pies, cheese, pickles, preserves, baked apples, baked pears, and tea. Truly a feast no one could despise.

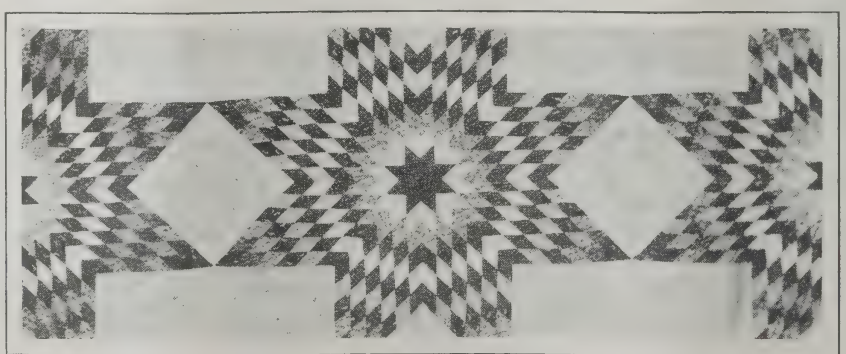
The expert quilters soon began their work. They marked the herringbone line with a piece of chalked twine. This was held taut while a helper lifted and snapped it. The resulting plain white line showed where to quilt. The needles flew in and out and the quilt began to assume shape.

There were some drawbacks to the pleasure. One woman had economically dyed the delaine dress which she wore. The wool had "taken" but the cotton had not. And, notwithstanding her repeated washings, whenever she laid her arm on the pretty quilt it left a smudge.

Tongues flew as well as needles, and the ears of "little pitchers" heard and remembered. The women discussed last Sunday's sermon, which had been about the increasing slave power. One illustration I remember:

"You might as well try to extinguish the fires of Mount Etna with feathers as to prevent the coming upheaval with compromise and talk."

Fragments reached our wondering ears: A voice above the din: "When I was a little girl a man, dressed all in white, appeared before my father, who was chopping in the woods, and said: 'One year from today I will preach here.' Then he departed."



Of course such an apparition was much talked of, and neighbors filled up the space in the woods with rude seats and a platform. At the appointed time a large audience assembled and the "White Pilgrim" came and preached a sermon they never forgot. The evangelists of that time—the White Pilgrim, Peter Cartwright, Lorenzo Dow and many others—made a permanent impression upon the settlers.

Bits of local history began to be remembered—a little girl, lost in the forest, slept for two lonely nights beside two kind "dogs" who kept her warm. A hunter discovered the "dogs" to be bears; and they lost their lives through their kindness. Another child, a little boy, only two years old, was stolen by the Indians and reared by them. When nearly grown he was discovered by a missionary and returned to his own people. The boy expected to have been forgotten, but his mother saw the group coming and shouted his name.

And so the time passed quickly. The quilting was finished, the quilt bound, the feast demolished, and a committee appointed to present it to the preacher's wife.

A few months later the firing on Fort Sumpter echoed through the land. We were unprepared, as we always have been, for war. When the first call was made and volunteers began to pour into Washington there were not sufficient tents, muskets, or blankets, and eager citizens supplied what they could.

And thus our gift to the pastor was caught up in the bloody maelstrom of war.

"The Old Maid's Dream." The diamond-shapes are separate pieces of material sewed to form the mosaic effect.

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

THERE are men who, in the face of all history, of the great changes wrought in men's condition, and of the new principles which are now acting on society, maintain that the future is to be a copy of the past, and probably a faded rather than bright copy. From such I differ. Did I expect nothing better from human nature than I see, I should have no heart for the present effort. I see signs of a better futurity, and especially signs that the large class by whose toil we all live are rising from the dust.

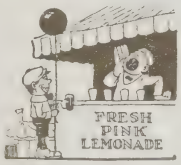
CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD

APRIL FOOL'S DAY originated in an ancient pagan festival, such as the Huli festival of the Hindus, or the Feast of Fools, celebrated by the Romans on February 17.

RECENT WRITERS giving their memoirs of Roosevelt quote his saying, "I am not a good shot," but omit the remainder of the statement—"but I shoot often."



H. W. WILEY, pure food commissioner, says, "The people of our country are learning little by little that the whiteness in flour is inversely proportional to its nutritive value."

THE SWEDISH girl gives her fiancé a plain gold band ring upon her engagement to him, while she in turn receives a similar token from him.

LAST AUTUMN, hundreds of miles of picket fence were put up along public highways in New York and Middle Western states to prevent snow from drifting onto the road.

ONE HUNDRED COTTAGES and barns will be built without nails, near Vermilion, Alberta.

THE SULTAN'S palace in Constantinople, the Yildez Kiosk, will pass into the hands of bankers to be converted into another Monte Carlo.

A RED BLANKET fell into a circus water-trough and stained the water red. From this it is said came the first pink lemonade which became so popular with circuses.

QUEBEC SERVING MEN of a hundred years ago removed the tablecloth with one expert whisk while the fruit dishes and finger bowls remained undisturbed.

CHRISTMAS TREES in France are potted and used for several years, after which they are planted in forests again.

THE AVERAGE FRESHMAN woman student at the University of Kansas weighs 119 pounds and is 5 feet 4-6/19 inches tall. A few years ago the averages were 126 pounds and 5 feet 3 inches.

EIGHT MILLION American Sunday newspapers are sold annually in Canada where Sunday newspaper printing is forbidden. American monthly and weekly magazines have a circulation of one million in Canada.

THE AMERICAN-CANADIAN Pecuniary Claims Commission has awarded the Cayuga Indians, now of Canada, formerly of New York, $100,000 in settlement of a guaranteed annuity of $23,000 that the State of New York ceased paying in 1809.

THE BRITISH unemployment dole will be paid for another year.

"BUFFALOE" WAS the original official spelling of Buffalo, New York.

THE ELEVEN HUNDRED West Point cadets eat a ton of meat, 300 pounds of sugar, 250 pounds of butter and 600 pounds of flour in breadstuffs and drink 1,200 quarts of milk daily.

A PATRON in a Swedish restaurant helps himself to sandwiches, cheese, and cold meats before ordering a warm dinner from the waiter.

WOMEN SPEND two to five times as much for shoes and stockings as for hats.

THERE ARE ABOUT 67,000 miles of trunk oil pipe lines, mostly eight-inch size, for the movement of crude oil from the fields to refineries.

UNIVERSITY OF TENNESSEE co-eds are eating "a head of lettuce a day to keep cosmetics away."

THE ONLY HAND-CUT marble building in America is the Pierpont Morgan library.

NEW JERSEY'S ANNUAL expenditure of $225,000 for mosquito extermination has increased taxable values $43,000,000 in affected areas.

A TURKISH RADIO owner may be questioned by the authorities at any time for his reasons for desiring to "tune in" on particular stations.

A LUMINOUS SPIDER exists in Burma, but no specimen has ever been caught.

IN 1874 the famous Dr. Osler examined two of his friends for life insurance. The one now surviving was refused insurance because of valvular lesion of the heart.

NEWSPAPER BOOTLEGGERS in Italy clandestinely sell newspapers which exceed the limit of criticism allowed by the Fascist Government.

TOKIO, JAPAN, is nearer the western extremity of Alaska than is Seattle, Washington.

A SEEMINGLY ORDINARY piece of carpet at 10 Downing Street, the official residence of the British Premier, was discovered, in the process of cleaning, to be a Persian rug of great value.

A TAME ELEPHANT eats more than one thousand pounds of green fodder and twenty-five pounds of unhusked rice daily.

FEDERAL RESERVE BANKS state that it costs the average bank 7¾ cents every time a depositor draws a check.

J. WARREN KEIFER, Springfield, Ohio, ex-Speaker of the House of Representatives is 90 years old; "Uncle Joe" Cannon will be 90 in May, and Frederick H. Gillett, the only other living ex-Speaker, is 75.

COLLECTORS PURCHASE about $55,000 worth of specimens every time a new postage stamp is issued by any country.

JOHN E. ANDRUS, of Yonkers, reputed to be worth $100,000,000, rides to and from work each day in the subway, although he is eighty-five years old.

THE MOMENT a young crocodile breaks its shell it is as active as at any time during its life.

ON CHRISTMAS eve, Norwegians put up a sheaf of grain for the birds to eat.

AMERICANS ARE seeking to lease Alberta lakes, for the purpose of raising mink and muskrats.

MORE THAN NINETY tons of reindeer meat were shipped into the United States from Alaska in 1925.

OBERLIN COLLEGE, Ohio, owns $10,585,000 worth of stock of the Aluminum Company of America, the gift of Charles M. Hall, a graduate, who discovered the process of making aluminum by electricity.

TOKIO AUTOMOBILES have mud guards attached to the wheel hubs to prevent mud from splashing on pedestrians.

ONE OF THE most deadly poisons known is that used by natives of Central Papua, who stick their arrows and war spears into a decomposing human body. A scratch of the skin from a weapon so treated means death within three minutes.

OSTRICH FEATHERS are no longer in demand due to bobbed hair. Ostrich skins are being made into handbags.

THAT WOMEN BE admitted to the ministry in Scotland was a resolution approved by the Presbytery of Hamilton, Lanarkshire.

EIGHT THOUSAND Bibles written in Chinese have been purchased by the Chinese National Army for distribution among its officers.

# THE ESSENCE OF THIS ISSUE:

Mr. Ford's Page this week discusses some "radical" and some "conservative" hindrances to progress.

---

Paris had gone mad! Outside Prince Murat's palace the crowds swirled in a frenzy of joy. *"Pres-ee-dent Veel-son"*—the words were a pean of victory. All the pent-up emotions of four long years of war were loosed. The savior of France was there, living and breathing in their very midst, come to avenge their wrongs, to reshape destiny. *"Vive le Pres-ee-dent Veel-son!"*

---

And inside the mansion Woodrow Wilson, calm, methodical, heedless of the cheers, went about the task—of selecting his future home! With Mrs. Wilson he plotted graphs and discussed cities. The world was at his feet; he talked of climate. (p. 2)

---

Another glimpse of Paris! Passion Week—but a few months before. The great drive of the Germans was on: white-faced men and women grimly awaited bulletins from the front. Weary refugees. Streams of wounded. An airplane hovering overhead; another, and another. And then the Big Gun—and death! (p. 4)

---

Let's swing to the other end of the scale—to life, and its preservation. Medicine has made tremendous strides, but it still has far to go. Dr. Alexis Carrel, famous surgeon noted for his research work in the Rockefeller Institute, tells with engaging frankness some of the things doctors cannot do. (p. 14)

---

The romance of plants. Have you ever wondered where the dahlia in your garden originated, wondered how it came to your home? Have you ever thought of those men who pass their lives in the dark places of the earth seeking beautiful flowers and trees for *your* enjoyment? Their adventures read like fiction. (p. 30)

---

*The mob is dead! Long live the law!* Well might this be the slogan of North Carolina, for that state has ended the reign of the mobmen. Read this story of the heroic attempt of the commonwealth to purge itself of the disgrace of mob rule. It is unique in the annals of the South. (p. 7)

---

Mentioning law enforcement naturally brings us to the prohibition problem. The question is asked on all sides nowadays: Can the dry law be enforced? The answer is: *It can!* Here is an article on a county where the law is *rigidly* enforced through the coöperation of the citizens and the courts with the prosecuting attorney. (p. 19)

---

Comments, both adverse and favorable, from all parts of the country, greeted the recent publication of George H. Brownell's articles on farm conditions. They form an interesting cross section of thought on agricultural matters. Some of them are printed herewith. (p. 12)

The Morman church is operated on a strictly business basis. The members contribute the Biblical tithe; and in return they receive many benefits. Occasionally their contributions are in the nature of insurance premiums, for they always receive aid in time of trouble. The church has vast holdings; its interests extend to all parts of the globe. This account of its management will interest members of other denominations. (p. 25)

---

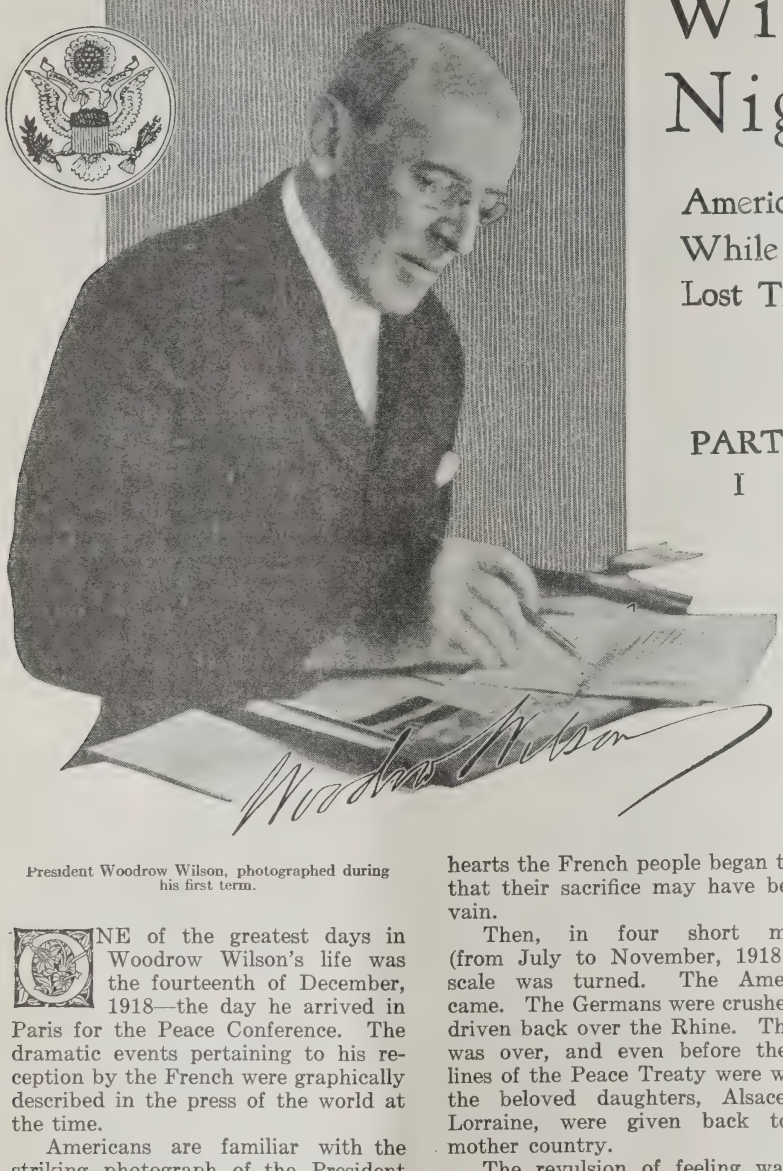
The study of the stars comes to us from antiquity. The ancients were in awe of the planets; they tried to correlate their movements with known happenings. Dr. Arthur W. Brooks, Episcopal clergyman and modern student of astrology, has been remarkably successful in forecasting earthquakes and other disasters. He gives us the secret of his predictions. (p. 8)

---

For unknown centuries men have mounted the slopes of Taishan in China to worship their gods. Confucius trod the path to its summit some 2,500 years ago, and the hill was then old as a place of reverence, as old, possibly, as any in the world. Its origin as a holy spot is unknown. It seems as immutable, as mysterious, as the Orient itself. (p. 21)

---

Among the many dubious appendages to the complicated financial system with which this country is burdened, the Consolidated Stock Exchange has occupied a leading position. Its usefulness, long questioned, has been vigorously challenged since the bucket shop scandals of a year ago. Its passing, reported near, will occasion little regret. (p. 6)



---

It requires genius to make a violin, just as it requires genius to play one. Never again, perhaps, will there be such violin makers as flourished in Cremona some three hundred years ago, Stradivarius, Guarnerius, the Amati. Their story is set forth, as is a short history of the violin (or fiddle), noble descendant of the old viol. (p. 16)

President Woodrow Wilson, photographed during his first term.

# Wilson's First Night in Paris

## American President Kept His Head While the People of the French Capital Lost Theirs in a Wild Tumult of Joy

By HUSTON THOMPSON

PART I

"If you can keep your head
when all about you
Are losing theirs . . ."

Thus sang Rudyard Kipling in h famous poem "If," which might very a propriately have been dedicated to or i spired by Woodrow Wilson had Kipli known the mental and spiritual pro esses of Wilson that memorable nigh

What was Woodrow Wilson doi while all Paris was losing its head, f losing its head it surely was, eve though it was on joy and *Vin Roug* On this night of this eventful, signi icant day in his notable career, whi the other prospective plenipotentiari were scheming for advantage in t approaching negotiations, how did t American President spend his tim The answer is revealed by a series characteristic incidents in Mr. Wilson life. They also reveal for the first tim a vitally important insight into h heart and mind on the eve of the Pea Conference. Undisturbed by the fren of happiness swirling about him Paris, and unmoved by the selfish d mands of his Allied associates, M Wilson talked frankly and calmly his approaching duties.

"I suppose you will soon be goi up to see the devastated regions, wor you, Mr. President?" asked an o friend from America, who called up Mr. Wilson that night.

The President looked up over h eyeglasses from a table, where he h been giving close scrutiny to a cros ruled sheet of paper. He sighed, la down a pencil he had been holding a allowed an expression of mock sorr to spread over his face.

"*Et tu, Brute?*" he asked, holding his hand in protest.

His caller showed his surprise his expression. He had been in Fran a year. For the month prior to M Wilson's arrival he had heard t French talk excitedly about taking M Wilson to the devastated regions. T newspapers had been full of it, and had accepted the plan of a visit perfectly orthodox. Everybody we up to see the devastated regions.

Mr. Wilson slowly took off h glasses, leaned back in his chair, a glanced affectionately across the tab

ONE of the greatest days in Woodrow Wilson's life was the fourteenth of December, 1918—the day he arrived in Paris for the Peace Conference. The dramatic events pertaining to his reception by the French were graphically described in the press of the world at the time.

Americans are familiar with the striking photograph of the President and Clemenceau, the old Tiger of France, riding in a carriage through the dense crowds of the Place de la Concord, Mr. Wilson standing and waving his silk hat at the surging throngs. The mercurial French people could not contain themselves as they realized that the man who, as they said, had ended the war, had given them back the "Lost Provinces," and who was the chief magistrate of the super-race that had turned the scale against the Germans, was actually in their midst.

All day Paris thrilled in joyful turmoil. Business was suspended. The American President had come, to finish the job himself! By eight o'clock that night thousands of frantically happy people were milling through the streets between the Hotel Crillon, the American headquarters, and Prince Murat's palace, where Mr. and Mrs. Wilson were stopping. For four years France had suffered in a devastating war.It looked as if the country would be overrun. With bowed heads and torn hearts the French people began to fear that their sacrifice may have been in vain.

Then, in four short months (from July to November, 1918), the scale was turned. The Americans came. The Germans were crushed and driven back over the Rhine. The war was over, and even before the first lines of the Peace Treaty were written the beloved daughters, Alsace and Lorraine, were given back to the mother country.

The revulsion of feeling was tremendous. From the depths of despair the French people swung to a pinnacle of joy that reached its greatest height the night of the day Woodrow Wilson arrived in Paris. From his house as a center, great waves of emotional ecstacy swept over the city. Poilus, girls, officers, American soldiers, Belgians, Italians, "Anzacs," Red Cross nurses, Canadians, British, and hundreds of thousands of French civilians of all ages and classes swarmed through the streets. Vehicular traffic ceased. Gay groups seized the German cannon adorning the parks as war trophies, tossed pretty girls upon them and hauled them all over town singing the Marseillaise. Men and women, boys and girls, soldiers and civilians of all nationalities on the Allied side of the lines, threw their arms about each other, danced hilariously, kissed each other on the cheeks and cheered for "Pres-ee-dent Veelson"—and for the country which had answered, as ever, the call of civilization and humanity.

toward Mrs. Wilson, who sat beneath a reading lamp sewing, very much as any American wife might sit with her husband in the evening.

"You know," he said, "I haven't heard anything but 'devastated regions' since I got off the boat in Brest yesterday morning. Everybody I meet wants to rush me off up there to see the damage done by the Germans."

He paused and his face settled into stern lines. The humor of a moment before suddenly faded from his eyes. His strong jaw came forward just a trifle and his firm mouth shut like a steel vise.

"Well," he declared, "I don't *want* to see the devastated regions. You know, as a boy, I was reared in the country through which Sherman marched to the sea. My boyish eyes saw the remains of Sherman's devastation. I don't *need* to see the devastated regions, therefore, in order to understand what has happened. Besides that, I don't want to see the devastation; I don't want to get mad. I want to keep my temper and my reason. I think there ought to be *one* man at the Peace Table who isn't angry, who isn't consumed by hatred and desire for revenge."

He ceased and toyed with his glasses for a moment. Then he looked up, with a patient smile on his face.

"In fact," he said, "if I had my way I'd adjourn the Peace Conference for a year and give all parties time to go home and get some of the bile out of their systems."

At that time Lloyd George had just completed a campaign for reëlection of the war ministry of which he was the head. His speeches had pledged the coalition government to "hang the Kaiser" and to maintain British supremacy of the sea. These points were mentioned by Mr. Wilson's caller as evidence that there was considerable "bile" to be got rid of.

Clemenceau, Wilson, and Lloyd George, photographed in Paris.

"That is true," said Mr. Wilson, "but I'm not worrying about Mr. Lloyd George's naval policy. Reduction of naval armament must be brought about; it is one of the inevitable results of this conflict, and Mr. Lloyd George will have to be reasonable. If he isn't I shall simply introduce him to the interesting fact that we are in position to build a much greater navy than England, if we have to."

The French "bile" of that time had been clearly revealed by M. Clemenceau's public utterances, just prior to Mr. Wilson's arrival. His position was that, first, Germany must pay to the last sou, brick for brick and stone for stone throughout the devastated region. Nobody dreamed what such a total would be, but that made no difference. Clemenceau (supported by French public opinion) pledged himself to get back, in the Peace Treaty, every dollar of damage Germany had done and every dollar that the war had cost France.

Secondly, Clemenceau demanded that Germany should be stripped of her merchant marine and that she should be denied any raw materials.

These were the two extreme demands of his chief associates with which Mr. Wilson had to deal. In each case the Premier had publicly pledged himself to his own people that his program would go into the Peace Treaty. Mr. Wilson knew this, but having "kept his head when all about him were losing theirs," he also knew they were impossible conditions. That was the reason he told his caller, on the historic night in question, that he didn't propose to go to see the devastated regions, that he did not want to lose his temper, and that he thought the Peace Conference should adjourn for a year before undertaking to write a treaty.

It is interesting to note that Mr. Wilson did, however, visit the devastated regions. He had not given to the French the same reasons for not going which he so frankly *(Concluded on page 22)*

Typical of the crowds which everywhere tendered Wilson a tremendous ovation on his visit to Paris. Wilson is in the carriage.

# Passion Week in Paris, 1918

## When the Big Gun Boomed and Brought Gethsemane

DRAWINGS BY GERALD VAN DER HEYDEN

By WILLIAM L. STIDGER

Paris from Notre Dame Cathedral.

THERE is no better time to tell it than this Passion Week of 1926, after eight years have passed

Friday, March 22, a week before Good Friday, the Big Gun began to fire on Paris. My diary of that date says:

"This is the first day on which a gun has been used by the enemy to fire a distance of seventy-five miles on a defenseless city filled with men, women and children. The city is stirred as never before since the days of the French Revolution. Business has stopped. Shops are closed. The tramways and subways are motionless. None but Americans are on the streets of Paris. There is something dreadfully ominous in the very air. The awful uncertainty of those great shells dropping, dropping, regularly every twelve minutes from out of the sky, seemed to stifle one. At first we did not know whether they were bombs from Gothas or what. Then came the announcement late this afternoon that the shells are coming from the Big Gun."

*Saturday, March 23.*

"Promptly at 7 the Big Gun dropped its first shell for today into the city. One needed no alarm clock to rise by this morning. The first shell shattered some glass in my hotel. We had an air raid again last night. Up yonder on the Somme the Big Drive has begun, and down here the air drive has begun. The Big Gun all day long and the Gothas at night. It is intended to terrify.

"Every twelve minutes the shells have dropped into the city. The railroad depots are literally crowded with people leaving the city with their children. I visited three *gares* today and baggage is piled up everywhere. I talked with a man in charge about the possibility of checking a trunk for a friend who had to go to Bordeaux, and he said that they would not promise to touch it for two weeks, because of the great exodus from the city of old men, and women and children. They were overwhelmed."

*Sunday (Palm Sunday), March 24.*

"Another air raid last night about one o'clock, and the Big Gun promptly at seven this morning. It is a strange Palm Sunday. The papers are filled with the awfulness of the loss of life up on the Somme line. It looks dark. Bishop McConnell preached a Palm Sunday sermon on the subject, 'How the Spirit of Christ Comes Back After It Is Apparently Crushed.' It was almost weirdly appropriate, and full of an eternal hope in such dark days as we are now passing through this Passion Week. He told us of how on Friday of this week he had spoken to a thousand Scottish guards the day before the big drive began. He had spoken in an old tumble-down theater near Amiens, and when he asked them what they wanted to sing they selected

*'O God, Our Help in Ages Past,*
*Our Hope for Years to Come,'*

and somehow this hymn had an uncanny prophecy of events that were about to transpire. The Bishop told us that he had preached to those boys on 'How Men Die,' and in a week most of that group to which he had preached had make the supreme sacrifice for humanity.

"While the Bishop was preaching three shells fell so close to the church that their explosion shook the windows. It was a strange service for Palm Sunday. We were a restless crowd, and it is no small tribute to the eloquence and power of the man that he kept that great audience of English-speaking people there at all, for the shells were too close to be safe. The newspapers humorously called it 'Bomb Sunday.'"

***The Big Gun Began to Throw Her Death***

*Tuesday, March 26.*

The Germans have taken Noyon, only thirty-five miles away. We have been notified as to where we shall get truck transportation in case the city is evacuated. Hand baggage only, allowed. I visited the Gare du Nord today. It is piled to the ceiling with the baggage of old men and women fleeing Paris. I saw old men and women in wheel chairs by the hundreds, men and women who have never been out of Paris in their lives. The Big Gun stopped shelling us for some reason this afternoon. We do not hear much news from the front, but we know that awful slaughter is going

on up there on the Somme. It is a weird time. It is a strange Passion Week."

*Wednesday, March 27.*

"Cold and sunless today. When I got up this morning there was what I call a 'War Sun,' blood red through the heavy mists that covered Paris. Last night there was a wonderful moon, but no air raid. Germany is sparing us for some reason. There is a rumor that she is so sure of entering Paris that the raids have stopped and the Big Gun has ceased firing. They do not want to destroy any more now that they are so near.

"I heard some French gamblers betting even money that the Germans would be in Paris in two weeks. The British have officially admitted that the situation is most serious. The French newspapers are saying, 'The enemy is so close that it is becoming difficult for the Allied Armies to maneuver.' We went to bed last night with the Germans only an hour away by train. But today a Frenchman with whom I ate dinner said, 'It is good news that we get today noon.' "

***An Awful Night in the Gare du Nord***

*Thursday, March 28.*

"Spent the whole day in the Gare du Nord caring for thousands of refugees pouring in from northern towns where the drive is pushing forward. They are pouring in at a rate of 2,000 a day. I went down last night at one o'clock and have been there all day. It is an awful sight. Old women carrying tiny babies have tramped on foot fifty and sixty miles, with nothing to eat for three days. This strangely sad Passion Week. They have been driven by thousands from their homes. One woman saw her little girl killed by a bomb, and she just had time to lay her on a bed and run for a truck that was to evacuate them. Three babies were born in the Gare last night. So continues this drama of life, death and suffering amid which one is brought to a realization of the divine in humanity. It is a strange Passion Week. If ever these poor refugees, and if ever these poor women, with their babies born in a cold basement of a railroad station, have gone into Gethsemane it is now.

" 'Never such a Passion Week since Christ!' one hears exclaimed on every side. That phrase seems to be on every lip. There are such strange parallels. The world seems to be betrayed this week. It looks as if the French and English armies will be separated and the channel ports taken. We say in our hearts that it shall not be, but we have to face facts."

*Good Friday, March 29.*

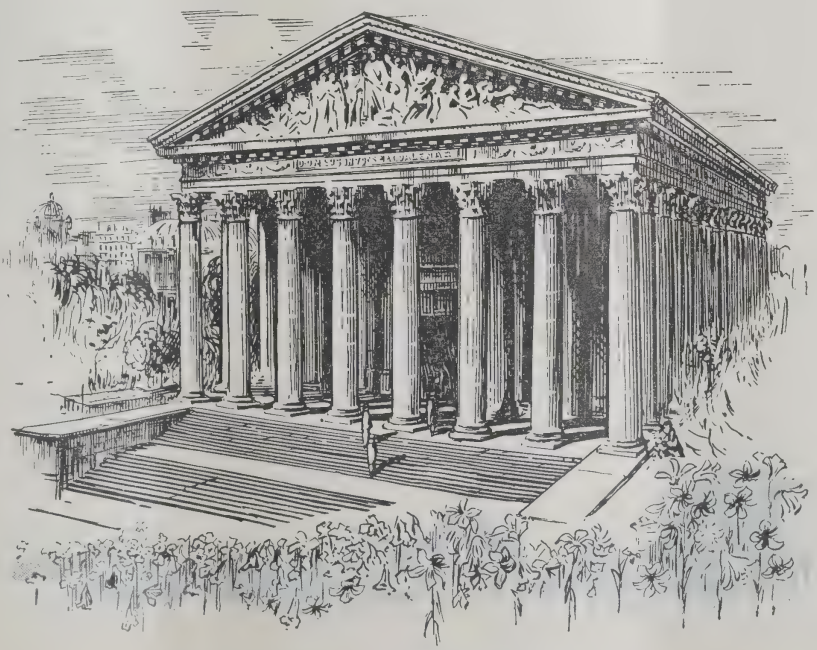
"I have never spent a Good Friday in my life when I felt more in the atmosphere and memory of Christ's sufferings long ago than I have today. In addition to the poor refugees with whom I worked all day and night, the piteousness of their suffering haunting me, I spent half an hour in the Madeleine this afternoon. The great church was crowded with soldiers of many nations, and men and women were everywhere. The service was strangely filled through and through with the 'Presence'; as if He were on earth again in a strangely human fashion in the suffering of the world. The churches are crowded today. Half of the French who are pouring into them are wearing black. Thousands of women and little children with weeping eyes passed me as I stood at the steps of the Madeleine and Notre Dame. This morning I came home from an all-night's work with the refugees, before daylight. I stopped at a church where working men gather and it was packed to the doors.

***The Old Woman Who Lost Her Crucifix***

"One of the refugees that we took to the hotel last night was an old woman. She had not brought much baggage, but she had brought a crucifix, a family relic. We had to put the refugees to bed on the floor of the hotel lobby at the Pavilion. This dear old woman somehow lost her crucifix, and when she discovered that loss she was more inconsolable than one other woman, I tried to comfort, who had lost her baby down at the Gare du Nord. She wailed and cried and shrieked so that she kept the rest of the tired refugees awake. We could not quiet her. Finally she got the whole crowd of more than two hundred refugees searching for that lost crucifix, until at last they found it and all could sleep.

"I went back to the Madeleine again this afternoon; it was crowded; when I came out the sky was covered with heavy black clouds to the north. One imagined it was the dense smoke from the big guns up on the Somme and around Noyon. The enemy seems to have gone mad with hate for this sacred day. The clouds drifted over Paris as from a burning world. Here and there between the clouds were blue patches. An aviator was patrolling the sky around, and around, and around Paris. Then others joined him, a great air patrol. The Germans had been threatening a daylight raid for some time, and as they seemed to prefer sacred days for their terror, it was expected today. Full churches make good targets.

***It Happened at "the Ninth Hour"***



"About fifteen minutes of three I left the Madeleine crowded and packed with worshipers, to walk to my hotel. I was thinking of Good Friday in America—of my church folks—my family—all keeping worship."

"The Ninth Hour"—

"The Big Gun had been silent most of the day, but suddenly I heard an explosion. It was the Big Gun. I looked at my watch and noticed that it was three o'clock almost to the dot, 'the ninth hour' of the Bible narrative.

"The earth shook as with convulsions. It may have been my imagination, but that shell somehow seemed nearer than any that I had felt.

"Then the news came. It spread like fire over Paris. That shell had thrust itself on this Good Friday afternoon, like the spear thrust into the side of Jesus—it had thrust itself into the side of that ancient and beautiful church of St. Gervais; at three o'clock, 'the ninth hour'—the hour that Jesus gave up the ghost. Hundreds of people were kneeling in St. Gervais, and seventy-five were killed. More than a hundred others were terribly wounded. What I saw there will haunt me forever."

The Church of the Madeleine, in Paris.

# Consolidated Stock Exchange—Finis?

## New York Financial Institution Reaches Stormy Crisis in Its Career

By A. R. PINCI

IN A FEW DAYS, or weeks—the precise time is not yet fixable—the Consolidated Stock Exchange in New York is expected to pass into history. Whether a new stock exchange will emerge from the ruins is not known, though rumors are current that such a plan is contemplated. Its dissolution was agreed upon by its Board of Governors, February 11, when this laconic announcement was posted on the bulletin board:

*Announcement Posted on Bulletin Board*

"Resolved, That the Governors of the Exchange confer with the members with respect to dissolution of the exchange and liquidation of its assets."

The assets consist chiefly of real estate holdings, estimated at $2,000,000 and pro rata equities, informally valued at about $5,000.

The announcement is regarded by many authorities as a sort of *pro confesso* judgment, coming after the attorney-general of the State of New York won the first of a projected round of legal battles, undertaken under authority of the general business law of the State of New York, known either as the Martin Act or the Blue-Sky Law. The victory consisted of a temporary injunction, which Deputy Attorney-General Keyes Winter sought to make permanent, and which, on the other hand, President Thomas B. Maloney intended—so he said during preliminaries and trial—to fight to the bitter end.

The fact that he secretly submitted his resignation to take effect February 15, and that the promised legal battle for existence will not materialize, are regarded as a great victory for the Martin Act, but more important still, as the doom of bucketing.

Bucket shops—which are offices and not stores—are those places where facilities are given for making bets in the form of orders or options based on current exchange prices of stocks, grain, petroleum, mining, et cetera, but without any actual buying or selling of the property. Bucket shop transactions are, under the laws, wagers, and the maintaining of a bucket shop is generally made an offense by statute.

*Several Firms Engaged in Bucketing*

It has been no secret that while the Consolidated Stock Exchange was not guilty of bucketing practices, that it tolerated speculative methods and made it possible for many brokers to do business who could not have done business without affiliating with it. Especially away from New York and the big cities, the gold-leaf lettering on certain offices reading "MEMBER OF THE CONSOLIDATED STOCK EXCHANGE OF NEW YORK" exercised an illusive influence which made business very good for those so-called brokers who believed in "dressing up" their business. In most of these instances untutored investors did business under the misapprehension that they were dealing with the New York Stock Exchange.

Significant indeed may be the fact that the Consolidated Stock Exchange's era of great prosperity coincided with the period when bucket shops were most active and numerous. Malodorous publicity accompanied the exposure of several firms which engaged in bucketing, while other firms which failed were more or less suspected of it. The 1921 deflation period weeded out a score, and more, of doubtful brokerage houses. Most of those had been or were members of the Consolidated Stock Exchange.

*There Would Not Be Great Mourning*

The effect on the public was not evident at first, but recent events seemed to prove that members of the Consolidated Stock Exchange were not suffering from the opulence prevailing elsewhere in stockbrokerage circles. The New York Curb Market, which gained its name because for a long time it was homeless and did business where Broad street traces a faint southeasterly elbow, has attained a financial prestige which is believed by many to surpass the Consolidated's heyday.

The passing of the Consolidated Stock Exchange will not be accompanied by great mourning. In the financial district it has long been considered a "maverick." The bulk of all trading has been apportioned between the New York Stock Exchange and the New York Curb Market—the Big Board and the Baby Room. None of the statements of some of its officials, friends and champions—that it was the little man's trading place—have been verified. Little men have traded in it, of course, but that did not make it the stock exchange for the little fellows.

It had long been contended that the Consolidated Stock Exchange duplicated the New York Stock Exchange. Consolidated officials denied that, but the fact was that the Consolidated really depended on the other institution's ticker and prices in determining its quotations. No satisfactory reason has ever been adduced by Consolidated officials as to why they stubbornly resisted the New York Stock Exchange's attempt to remove its tickers from service there.

At a time when public confidence in the Consolidated Stock Exchange was not noticeable, bucket shops were being prosecuted in the courts, member houses were posting their failure for huge sums, W. S. Silkworth, then president, in reply to a newspaper questionnaire, explained in part its service as follows:

*Trading in Odd Lots of High-Class Securities*

"The service which the Consolidated Stock Exchange gives is distinctly unique in regard to all transactions in odd lots. The Consolidated Stock Exchange, it is interesting to note, was the first exchange in the United States to start trading in odd or broken lots of high-class securities. This departure was made as a concession to, and in fairness and justice to, the investors and traders whose limited means prohibited them from dealing in as many shares as the unit of trading on the New York Stock Exchange."

Incidentally, there are two or three odd lot houses, members of the New York Stock Exchange, who do a huge business, and at least one of those transacts a larger business than the entire Consolidated transacted any one day. The odd lot house differs from the ordinary broker in that it has no personal customers, as its clients are brokers and bankers; in its transactions acts as a principal, not as an agent, as do other stock exchange firms.

The standard unit of stock purchase and sales on the New York Stock Exchange, since its foundation, has been 100 shares, but the daily business in odd lots has attained such proportions as to oblige the Stock Exchange to provide facilities for the handling of such orders.

Weighing facts as they are, the student of our financial history of the day will note at once that New York Stock Exchange trading has been increasing, whereas Consolidated Stock Exchange trading has been decreasing. This low ebb mark has been considered by many authorities a proof of the present useлessness of the Consolidated Stock Exchange.

*New York Stock Exchange and Consolidated*

It must not be understood, of course, that membership in the latter house is a stigma, or that membership in the New York Stock Exchange is virtue itself. There are responsible individuals in the latter today who formerly were members of the Consolidated. Probably in the near future present members of

# North Carolina Crushes Mob Rule

## Campaign Against Lynching Lands Scores of Citizens in Jail; "God Save the State That Has to Depend on Mobs to Protect the Women"

IT REQUIRES no stretch of the imagination to visualize the succession of striking victories for law and order recently won in North Carolina. This state, when it awoke to a realization of its economic possibilities, after years of torpidity, set in motion programs that attracted nation-wide attention. The awakening, which was the result of the leavening influences of education, was attended by the birth of a new spirit which found expression not only in material advancement and educational achievement but also in the establishment of higher human relationships. The physical proved to be incidental; the spiritual factors involved became dominant.

In the suppression and punishment of mob rule lies North Carolina's greatest achievement. The utilization of material things for the advancement of the people and to promote their happiness was, of course, commendable. However, all that was required, once this state was educated to the point where it realized its needs, was that the abundant supply of available natural resources be capitalized and pressed into service. But in the great moral crisis that was at hand creative forces were brought into play. It has been seen that there was something at work besides merely a desire on the part of an American commonwealth to be materially great.

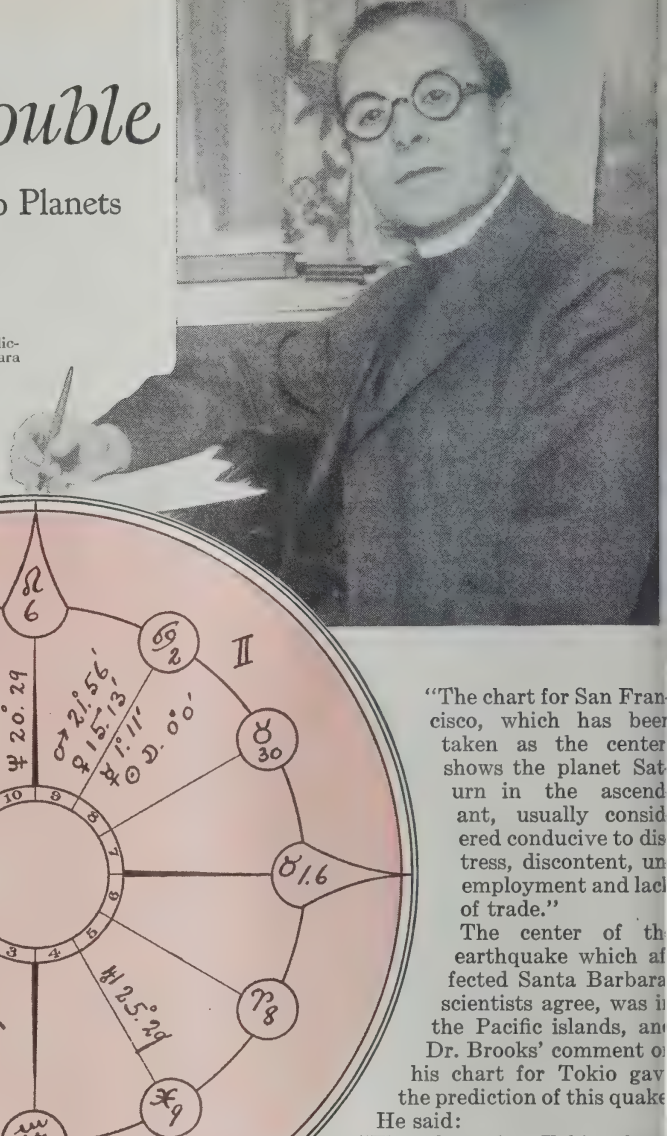
A handful of soldiers, sworn to help maintain order, can disperse a mob, because a mob is a coward. But it requires community and judicial courage to punish those who constitute a mob when they are apprehended.

For nearly five years there has not been a lynching in North Carolina. The last one was during the summer of 1921. The probable formation of numerous mobs, however, has been prevented by the use of troops at the first sign of trouble. Yet, in spite of all precautions, there were two notable outbreaks during 1925. In each instance the offenders were not only rounded up by the law but were tried, convicted and imprisoned, a thing heretofore unheard of to any great degree. In this wholesale victory for law and order North Carolina won the plaudits of the entire nation.

Between April 1 and November 15, 1925, threescore men were arraigned in the Superior Courts of North Carolina for alleged participation in attempted mob rule. That they should have been arrested at all was an innovation. Convictions and the imposition of prison sentences resulting from these trials not only attracted favorable attention abroad but served as a warning at home. In other words, the world now knows that North Carolina will not, under any circumstances, tolerate mob rule. The laws of the state must be respected, and those who attempt to administer them outside of courthouses do so at their peril.

Experience has shown that a mob is a coward, not only collectively but individually as well. Of the sixty North Carolina offenders arraigned in court during 1925, many threw up their hands and did not even offer to put up a fight when they found themselves in the meshes of the law. Their plea was for mercy, a virtue that they themselves had been unwilling to exercise while acting in the heat of passion. This was strikingly true in one case where the mob proved to be probably the most unmerciful of any that had ever assembled in North Carolina, when it took a white man from jail and inflicted a form of punishment to which death would be preferable to most men. While the majority confessed, some held out and were tried by juries and sentenced to terms ranging from a few months on the roads to thirty years in the state's prison.

The thirty-year man, whose sentence was equivalent to the maximum imposed in North Carolina for second-degree murder, appealed his case to the Supreme Court. He lost. The opinion affirming the verdict and judgment of the lower court was a scathing denunciation of mob rule and a declaration that it must be forever driven from the state.



Members of the Supreme Court who passed on this appeal and concurred in the written opinion deciding it against the prisoner were: Walter P. Stacy, chief justice, and W. J. Adams, George W. Connor, Heriot Clarkson and L. R. Varser, associate justices. It might be added that each of these gentlemen is an active member of the church. Chief Justice Stacy teaches one of the largest Methodist Sunday school classes in the South. Associate Justice Varser, since resigned, taught, during his residence in Raleigh, one of the largest Baptist Sunday school classes in this section. Associate Justice Clarkson is an active Episcopalian, having served as senior warden in St. Peter's Church in Charlotte, which has furnished the diocese of North Carolina with two bishops. Of the remaining two, Associate Justice Connor is a devout Episcopalian, and Associate Justice Adams a devout Methodist.

By far the most dramatic battle and brilliant victory for law enforcement ever waged and won in North Carolina took place (*Continued on page 23*)

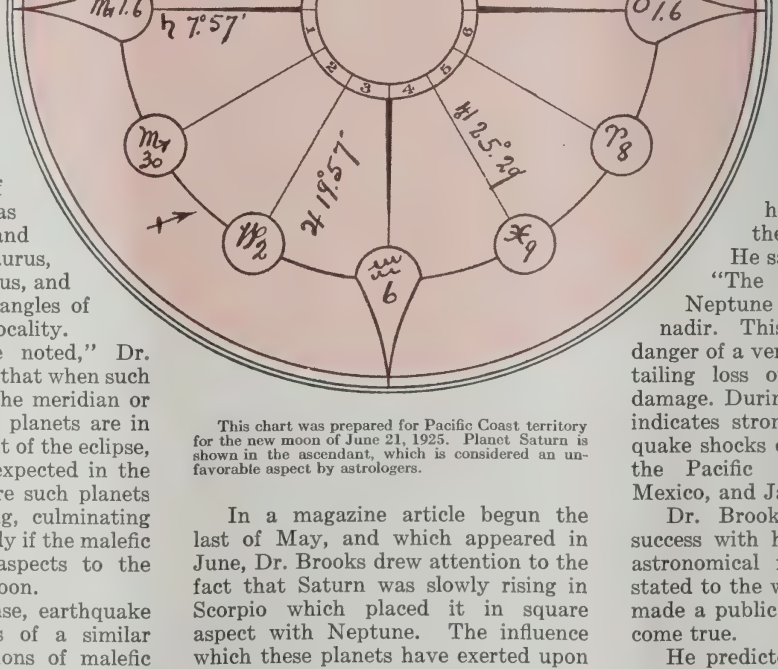
# When the Stars Foretell Trouble

## Relation of Earthquakes and Cyclones to Planets

By FRANK DORRANCE HOPLEY

Dr. Brooks, who predicted the Santa Barbara earthquake.

PLANETARY influences were the direct cause of the recent earthquakes in California and Montana. Certain of the stars in conjunction at that time had an important bearing on the seismic disturbances."



This statement was made recently by the Rev. Dr. Arthur W. Brooks at the Fraternity Club in New York City. Dr. Brooks, who has made an intensive study of the heavens for years, has forecast disasters with remarkable accuracy. He predicted the earthquake at Santa Barbara two weeks before it occurred. How does he reach his conclusions? He says:

"By scientific investigation over a long period of time, it has been ascertained that earthquake disturbances, tidal waves, cyclonic and tornado disturbances may be expected as a sequence to eclipses, and also the alignment of certain planets such as Mars, Neptune, Saturn and Uranus in the signs of Taurus, Leo, Scorpio and Aquarius, and likewise if these are in angles of the chart made for any locality.

"Then it is to be noted," Dr. Brooks went on to say, "that when such malefic planets fall on the meridian or nadir, especially if such planets are in fixed signs at the moment of the eclipse, earthquakes are to be expected in the parts of the world where such planets are either rising, setting, culminating or on nadir, and especially if the malefic planets form adverse aspects to the eclipses of the sun or moon.

"In a secondary sense, earthquake and other disturbances of a similar nature follow conjunctions of malefic planets, such as Mars, Neptune, Uranus and Saturn."

Dr. Brooks stated that the period of planetary influence after an eclipse depended on the length of totality of such eclipse. In the eclipse of January 24, 1925, the totality was one minute and eighteen seconds. This would indicate that the planetary influence would last for one year and two months.

This chart was prepared for Pacific Coast territory for the new moon of June 21, 1925. Planet Saturn is shown in the ascendant, which is considered an unfavorable aspect by astrologers.

In a magazine article begun the last of May, and which appeared in June, Dr. Brooks drew attention to the fact that Saturn was slowly rising in Scorpio which placed it in square aspect with Neptune. The influence which these planets have exerted upon the earth in similar aspect caused Dr. Brooks to predict the earthquakes that shortly came to pass.

Dr. Brooks' calculations were made on astronomical formulae. The article in question was finished June 12 and accepted by the magazine June 14, two weeks before the earthquakes occurred.

The article referred to the Pacific Coast thus:

"The chart for San Francisco, which has been taken as the center shows the planet Saturn in the ascendant, usually considered conducive to distress, discontent, unemployment and lack of trade."

The center of the earthquake which affected Santa Barbara scientists agree, was in the Pacific islands, and Dr. Brooks' comment on his chart for Tokio gave the prediction of this quake. He said:

"The chart for Tokio shows Neptune rising with Saturn at nadir. This is an indication of the danger of a very serious earthquake entailing loss of life and considerable damage. During the quarter the chart indicates strong possibilities of earthquake shocks occurring in Asia Minor, the Pacific islands, Persia, India, Mexico, and Japan."

Dr. Brooks has had remarkable success with his predictions based on astronomical formulae. In fact, he stated to the writer that he had never made a public prediction that had not come true.

He predicted the great earthquake in Japan some time before it happened. He foretold the illness and death of President Harding, and six days before the President left on his western trip Dr. Brooks wrote him urging him not to go. The deadlock in the Democratic Convention of 1924 was predicted by Dr. Brooks several days before it occurred as well as the nomination of John W. Davis. Dr. Brooks' horoscope of Calvin Coolidge (Concluded on page 1

# MR. FORD'S PAGE

IF THE chief barrier to progress is human inertia, the next is misdirected human energy. Nature itself, the propulsive power of life, overcomes the first. But it requires experience, and reflection upon experience, and the wise interpretation of experience to undo the errors, or rightly direct the efforts, of the second.

Both conservatism and radicalism, as we know them in their extremes today, are the enemies of progress. It is becoming quite the fashion to cry down all progressive social aspiration by identifying it with bolshevistic destructionism. It is only too true that the progressive movement has been seized and used as a cloak for the active agents of the subversive movement; and it is only too true that unprogressive conservatives have seized upon this as an excuse to attack all progressive movements and thoughts; and between the two the spirit of progress seems to have been suppressed—damned on both sides by misidentity.

But both sides being in by trickery—one to misuse the party of progress by using it; the other to condemn the party of progress because of this misfortune—the result can only be a clear exposure of the falsity of both positions.

There are today two falsehoods. First, the falsehood of the so-called radicals that progress requires destruction of what exists. Second, the falsehood of the so-called conservatives, that progress is identical with anarchy and destruction.

It requires no words to dispose of the first falsehood. The people of this country are quite clear-sighted on that point. The bulk of the nation are too well fortified with common sense to become disciples of that theory. We are racially undergirded by instinctive self-protective apprehensions which have determined the development of our type of civilization.

The second falsehood has the greater power and is working at present the greater deception. In their extreme revulsion from the doctrines of the destructionists our conservatives have fallen into a suspicion of all criticism of the present social order as being destructive in origin and purpose. The people's healthy rejection of the "bolshevik" has led ultra-conservatives to use that term as a defamatory label on all progressive thought.

If this were a mere matter of strategy, if it were simply agreed that while the forces of destruction were abroad all right-minded men should band together to hold things as they are; if it were simply agreed that because the destructive movement had stolen the progressive livery it were better for the progressives to remain in abeyance for a time, all that could be understood and would mark the agreement between all right-minded citizens of conservative or progressive tendencies. But when the conservative element joined with the destructive element to make the progressive spirit an odious thing, it became time to state the matter as it is.

Both extreme radicals and conservatives are consciously and intentionally the enemies of progress. The radicals do not hesitate to say it in so many words. They say boldly that they do not want the social machinery improved, they do not want the lot of the working man bettered, they do not want the slack between the people's will and political action lessened, they do not want life to grow better and better for the multitudes. They say that they want things to grow worse, the worker's lot to grow harder, the government to grow rottener, they want life in the United States to grow unendurable, for then they may have hope of leading our people to destroy all law and order. This they preach in so many words. It abounds in their printed works. It explains why they regard social improvement as their enemy.

*DESTRUCTIVE radicalism is the foe of progress because it knows (and says) that betterment of social conditions neutralizes revolutionary activity. Hard-shell conservatism is the foe of progress because it thinks of human wealth in terms of the present quantity and is moved by unintelligent selfishness. Both attack progress, one by assuming its name and robe to disguise the purpose of radicalism, the other by attacking it as "bolshevism." There are too many attempts to suppress progress by calling it names. Suppression of progress plays into the hands of the social enemy. Every advance in social justice establishes the nation.*

The conservatives have not the high excuse of a fanatic cause for their attitude; they dislike progress simply because it is going to cost them something—at least, so they think. It is going to cost them most heavily in their selfishness, that is all. Conservatives dumbly imagine that social progress means division of the present wealth, to the decrease of their store. They have no idea of the productive abilities that would be liberated by more justice and opportunity, and by the greater general increase of wealth to all. They have not thought that far. Their own selfish policy having but little increased the general wealth, they are blinded to the power of unselfish social improvement to increase immeasurably the general stock of the things we need to live. To them also, all friends of social improvement are the enemy.

Between these two parties, one representing the misdirection of human energy, the other the inertia of selfishness, progress has for a time been prisoned. It is now time to recognize that there are three in the field, and that true progress cannot be misidentified with either of the others to its hurt.

# EDITORIALS

## *Stocks vs. Business*

THIS magazine has long contended for the proper understanding of the stock market as having nothing whatever to do with business. Stocks up or stocks down, they have nothing to do with the quality and quantity of industrial production. That this idea is finding lodgment in the American mind was strongly indicated by the calm public demeanor which greeted the latest break in the stock market. In other years, all kinds of business would have reacted with a tremor; this year none was affected. The American people are beginning to understand that what occurs among the speculators of Wall Street has no more effect on American industry than the fate of the bank at Monte Carlo. We have said that the best service the stock market renders the public is so thoroughly to shear otherwise capable men as to compel them to go back to real work. Anything less than production is not a man's work.

## *Chicago Will Act*

THE confession of Chicago's inability to cope with organized crime is the most shameful acknowledgment in the annals of American cities. With the authorities supine or incapable, with courts failing to function properly, law-abiding citizens are at the mercy of alien gunmen who make terror and murder highly specialized avocations! Was there ever such a damning indictment of inefficient officialdom as the plea of 200,000 citizens to the Federal Government for protection? Witness their description of conditions there:

> There has been for a long time in the City of Chicago a colony of unnaturalized persons hostile to our institutions and laws, who have formed a supergovernment of their own—feudists, black-handers and members of the Mafia—who levy tribute upon citizens and enforce collection by *terrorism, kidnapping and assassinations.*

The story of Chicago's disgrace is a story replete with details of the glamourization of iniquity—of elaborate kowtowing to gangsters, of police officers attending bootleggers' banquets, of despicable assassins set up as heroes by the yellow press. The golden coffin of Dion O'Bannion and the steel vest of Martin Durkin are symbols of the whole monstrous scheme—a scheme which has its reflection in unbridled killings, in robberies, in bomb outrages, in brutal attacks.

Jurors have been taught by speedy reprisal not to vote for the conviction of gunmen! The records of the courts form a monotonous repetition of acquittals. Forty policemen have been slain in line of duty during the past five years, *yet only three men have been hanged for the murders!* Chicago's lawlessness casts its somber shadow over the surrounding country for hundreds of miles. Swarthy gangsters swarm forth to rob and kill, and then rush back to the city for shelter and protection.

Once the pride of America, Chicago has become the fetid breeding place of crime. The city must purge itself of the vicious criminal larvae—or consent to its being done by others.

## *Going Too Far*

THE Baptists of Minnesota, as an organization, are asking legislation forbidding any teaching of the Darwinian theory of evolution in the state university. The cause of religion has in such friends its worst enemies. The right to restrict education in this manner, if logically extended, would preclude any information as to the theory of religion itself. It is part of the education of the modern man to know the elements of the theory of evolution, just as it is for him to know the "nebular hypothesis," which is another interesting but unproved theory.

In earlier days religious denominations undertook the task of public education. The work of instruction was regarded as a sacred duty. Many of our greatest American secular universities were founded by religious individuals or bodies. There has never been any doubt about the duty of these institutions to explain all the philosophies that have commanded the intellectual respect of mankind. Theories must be understood to be intelligently evaluated.

The evolutionary philosophy is no exception. Objection can only arise where acute partisan propagandism crams the philosophy down the student's throat as the final truth. Laws cannot dispose of a philosophy or scientific theory. Only fuller knowledge can do that.

When the theory of evolution is presented to the student, the off-side of the case

should be stated, too. The case against evolution is of quite as great scientific respectability as the case for it; and an educated man is able to state both. By this test many if not most of our teachers of evolution have not been educators but propagandists.

The opportunity to analyze the merits and defects of the theory of evolution is the college student's due. The same is true of religion itself, for no principle is more a subject of dispute than is religion. If, however, evolution is being taught as a covert sort of anti-religion, the Baptists of Minnesota have the right to protest that the teaching of anti-religion has no place in a state university.

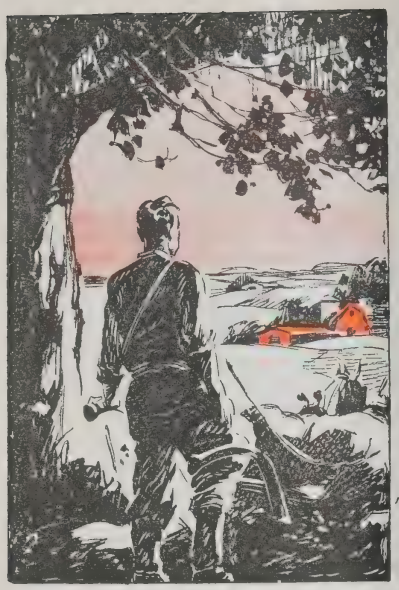
## *Whiten Washington*

THE movement to restore a respect for Sunday to the capital of the nation is worthy of encouragement. We read every history save our own with the mind of the historian-prophet; we know what Babylon typified and pagan Rome and frivolous Paris; we have always passed from the morals of the Capital to the menace of their threat to the State. Reading the city of Washington thus, it is possible to get something like Carlylean reactions. In the capital of the nation there is every evil thing—gambling and legislative dishonesty being the least of evils. The inside story of Washington would somewhat resemble Babylon turned inside out. It is not the sober place one would expect in view of the responsibilities with which it is charged. It is a place of frivolity, low trickery and vice. On Sunday its movie audiences outnumber its church attendance ten to one. If there is any city in need of the rectifying influences of a meditative and religious Sunday it is the city of Washington.

It is not, however, laws that will accomplish this, nor sheer denunciation. But it would do much good if a faithful mirror could be held up to the capital that it might see itself, not in the glamour which it carries to itself from the thousand places of origin, far-sundered, of its temporary residents, but as it is.

## *Lo! The Poor Alien*

*HUMANITARIANISM* is the catchword adopted in the latest assault on this nation's immigration bars. Specious pleas for pity for the poor alien accompany the attack. Heart-rending tales are conjured; cold facts are coated with lachrymose appeals; reason is borne down by propaganda.



The most insidious of the eighty-odd measures for tampering with the immigration law, now before Congress, is the Perlman bill. It is purely a Jewish proposal, devised by Representative Nathan Perlman, indorsed by Carl Sherman of the legislative committee of the American Jewish Congress and staunchly advocated by Rabbi Stephen S. Wise. The bill would admit to the United States fathers, mothers, wives and unmarried children of alien residents, regardless of quota restrictions. Under the present law 164,667 immigrants are allowed to enter the country each year; the Perlman bill would grant admittance to 622,000 more.

The arguments of its proponents are best set forth by Rabbi Wise: "Whom God hath joined together," he proclaims, "let no Congressional enactment rend asunder and keep asunder." But wherein has Congress rent asunder these aliens? Did it compel them to leave their homes and come here? Has it forbidden them to return to their families? Has it decreed that these families shall not enter under the regular quota regulations? No! Why then should we again allow a foreign influx into America, merely to please those who would use sentiment bolstered with false statements as a weapon to enforce their demands?

Congress did not separate these families. They separated themselves in full knowledge of what they were doing.

## *Adjourning to the Country*

SENATOR BORAH'S announced intention of continuing before the public the debate which was suppressed in the Senate is receiving powerful emphasis from the condition of international affairs. The lath and plaster peace of the politicians gives ominous signs of cracking. The old diplomacy of war becomes every day more apparent, its present weapon being the verbiage of peace. All this should help misled Americans to see that peace as a "plan" and peace as an achievement may be quite different things. All of us stand for Peace; most of us see that the talk-and-paper temple reared for her is not sufficient to contain her. And all Americans, of every party, strongly agree that when the people of the United States take up international political alliances of any kind it should be by their express word, and not by the activities of Mr. Bok or Mr. Coolidge, for with all possible respect for these gentlemen, they are not and never can be the American people, and they have no means of knowing the people's mind except through the people's voice. Senator Borah is wise in continuing the only important debate *silenced by order* in fifty years. And when the debate is finished the people will give their vote.

# What Do Our Farmers Think of Mr. Brownell's Articles

## Interesting Cross Section of Thought Revealed Are Advanced But No Real Solution Is Offered;

AS EXPECTED, George H. Brownell's analytical articles on agricultural conditions in this country, printed in THE DEARBORN INDEPENDENT in the issues of October 3, October 10 and October 17, have caused widespread comment.

Many persons agree with the views expressed by Mr. Brownell. Others differ on some points, and some criticize his entire analysis in caustic and bitter terms. The different reactions to the articles in various parts of the land and by various types of people are interesting as providing a cross section of American thought on agricultural matters.

Although Mr. Brownell described in detail many of the existing farm evils, he did not present any solution of his own. Instead he wrote:

"But if I am confessing to an inability to provide a remedy, I am by no means at a loss to predict what is going to happen to agriculture in this country . . . Farming will be surely, adequately and profitably conducted in this country by the same methods that our large industries are conducted . . . Guided by experience gained in other forms of industry, it will employ the advantages of large-scale production to reduce the prices of farm products and thus increase consumption . . . There will be absorption and amalgamation of small farms into large units of a thousand, five thousand and more acres directed by an able chief from a central office located in a city or village."

Several critics, basing their arguments on the premise that this prediction was the writer's solution to the present situation, vigorously attacked a number of the points raised. One of the most interesting comments is that by James E. Boyle, professor of Rural Economy at Cornell University. He writes:

"In general I say your diagnosis is good, although I cannot fully agree with your remedy. No doubt, we do have too many acres, too many farms, too many farmers. Your remedy for this situation is corporation farming, apparently . . . I believe we are moving from the corporation farm to a farm which I call the family-sized farm.

"You prove that we need larger farms. My answer is yes, we should abolish the forty, fifty and sixty acre farms in a great many cases and put in their place a farm two or three times as large. This would secure the benefits you have in mind without going to the doubtful experience of corporation farming. I believe the farm business requires the undivided personal attention of the farm owner or tenant twenty-four hours a day about 365 days a year. In short, I do not think you could apply what you term large-scale business methods to farming.

"I think you are right about coöperative marketing. Coöperative marketing has actually proved that the marketing problem in the last analysis is 90 per cent a production problem and 10 per cent a marketing problem."

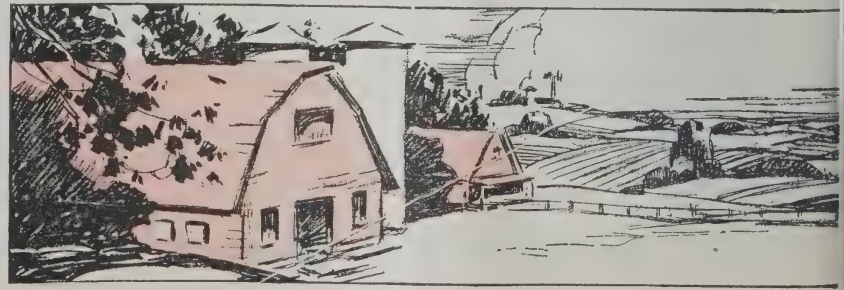
*Speaks About "an Enemy to the Farmer"*

A sharp rejoinder comes from W. H. Bean, of Blue Mound, Illinois, who does not appear to like anything about the articles. He says, in a letter to this magazine:

"It is rather a surprise that you should permit such an enemy to the farmer to take up so much of your space . . . Frankly I am grieved that you should place your paper in antagonism to us. We can get along and prosper without you, but we hate to lose a friend."

Another reader, who seems not to be a believer in the soft answer, is Joseph Thomas, of Honey Creek, Iowa, who writes:

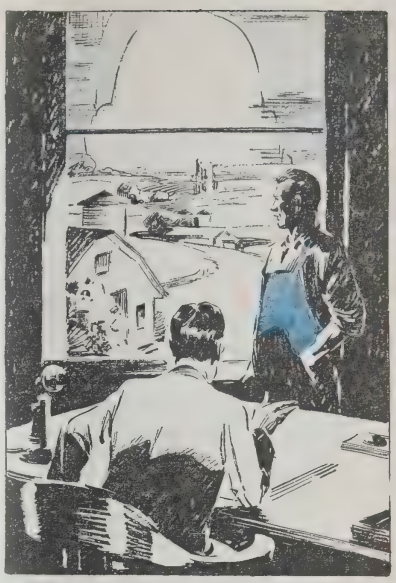
"I consider your article on farming, written by George H. Brownell, an insult to any farmer. As any fair-minded man will admit, we produce enough but don't get enough for it. And the worst enemies we have are those university professors who write for the magazines. Why don't they get on a farm and prove their talk? It is only a scheme to put the farmers out of business, and then when the land gets in the hands of a monopoly you will not get farm produce as cheap as you have been."



B. Waldron, of Brucefield, Ontario, writes a frank and interesting letter:

"Yes—they made me hot under the collar until I remembered I held very similar views, and still hold them, but have also acquired other views about the economics of farming . . . Mr. Brownell, to do him justice, I might say, is right up to the minute on farming, but painfully out of date and old-fashioned and obsolete on his economics . . . Ask any ordinary person what they are looking for and working for, and the answer will be money. But it isn't money. It is food, clothing and shelter we are striving for, just as did our prehistoric ancestors and as will our descendants a million years hence.

*High Cost of Implements As a Factor*



"About sixty years ago the United States and Canada became imbued with the protection bug: 'High tariff must protect our infant industry.' Now America is mainly an agricultural country and as such its farmers produce a surplus of foodstuffs, and this surplus is sold abroad in open competition with the world; and the prices received abroad for the surplus set the farmers' selling price. But when the farmer buys he purchases in a protected market, in consequence of which his buying power is much reduced . . . The farmers' prices have receded to a pre-war basis while the manufacturing prices have not."

An important feature—the cost of implements used on a modernly equipped

# Think of Agriculture? Are Analyzed by Readers

## By Letters of Comment, and Numerous Theories Various Phases of Land Problem Are Treated

farm—is stressed by Asher C. Sackett, of Sunfield, Michigan. He writes:

"The tool question is a big one; it is a big bill of expense which our fathers and our grandfathers did not have. A small, one-man farm takes as much money for harvesting tools as one three or four times its size. Farmers should coöperate more in the matter of harvesting and planting machinery and plowing and fitting. If two eighty-acre farmers could agree and own a tractor together it would dispense with one or two horses for each one. We might go further and say that cow barns, sheep sheds and pig pens could be used jointly. The trouble is that it is hard to get two men who can see, think and believe alike; and not get jealous of each other or think that the other man is not doing his part."

Objection to the nation's banking system is expressed by T. B. Hillmon, of Maywood, Illinois:

"I have read Mr. Brownell's articles and just want to tell you that I do not like his remedy, as it is too old-fashioned. His remedy is the same as that of India, England and France and all the other nations that are run by the landlord system. It sure looks like the rich people are going to own the farms if we do not change our system of getting money to the people. Our present system makes it impossible to diminish any debt after it is once contracted, and we have to go deeper in debt to pay the interest. I should think any man who can diagnose as well as Mr. Brownell ought to be able to tell the cause of the centralization of wealth. The reason why the farming business is a failure is: The farmers have been paying eight per cent interest for money and their business only pays two per cent on the investment."

***A Remedy Like India, Britain and France***

Guy A. Peterson, of Madison, Wisconsin, comments as follows:

"I read the first article with considerable interest, because save for a seeming ignorance of the trend of agricultural land prices in the eastern states and a few minor details, it was a thought-provoking article, with more or less truth in it. Of course we have a few large farms in America that are making money. Some of these are producing as much or more food than would have been produced from the same land, had they been divided into average-sized farms, but the trend of American farms is certainly not pointing to large units of one thousand to five thousand acres. We want the family-sized farm, not only because that seems to be the farm that makes for the most happiness and stability in our rural sections, but because that size of farm will produce food more economically than will either a larger or smaller farm. The number of acres on that farm will depend on the type of farming followed. Many of our five and ten acre vegetable and flower farms are really larger farms, that represent more investment of time and labor, than some of the thousand-acre wheat farms of Kansas or the Dakotas."

One particular phase of the articles—that in which Mr. Brownell recommended elimination of the scrub or "boarder" cow—is taken up by John D. Nims, of Jerome, Idaho:

"The discussion centers around what may be called the super-cow. In other words it is assumed that it is possible to produce a breed of super-cows, and through this process eliminate the average cow. This is not possible; it is no more possible than it would be to produce a race of all super-men. It has been said that quality, as well as price, is simply relative."

As to the use of business methods on the farm, Paul Walker, extension expert for a large milling company, has this to say:

"My observation in the past few years has led me to see that in every community there is at least one man who is making money at the farming game. All the rest are merely breaking even or going under. In turn I have noted that these individuals making money are the types who would have been successful business men."

W. Morgan Shepherd, vice-president of the *Southern Planter*, oldest agricultural magazine in the country, has this comment to make on some of the points stressed in the articles:

"Food costs the consumer too much and at the same time the producers receive too little. It is this gulf that will have to be bridged in some way. Coöperative marketing does not look to me from this distance as being able to do the trick. It may help in the form of a close organization of farmers, but all the money to be made in farming will have to come out of more economical production."

In conclusion, a short quotation is given from a letter written by Mr. Brownell to a California man who protested that the underlying cause for farm unrest was the middleman's profit. Mr. Brownell's answer follows:

***Middleman's Profit As a Cause***

"There is no 'deadly spread' between the producer and the consumer. Modern business strife is so keen and so ruthless that the moment a so-called middleman fails to perform a genuine worth-the-pay service, he is eliminated by either the man to whom he sells or the man of whom he buys. Once in a great while, for a brief moment, some middleman beats the game; but never for long is he able to set aside this inexorable law of business . . .

"Business today is looking for *volume* of business as a source of profit. It wants many little profits on many units—and not a large profit on a few units."

# Things That Doctors Do Not Know

## Can Modern Medical Science Build Up Better Men and Women?

By DR. ALEXIS CARREL

IT APPEARS particularly appropriate, I believe, to speak of the progress of medicine in this hospital (Rockefeller Institute) where for many years the clinical divisions and the laboratories have worked together for the greatest benefit of the patients and also for the advancement of medical knowledge, that is, for the good of the future patients. We must always realize that the only purpose of medicine is to decrease human suffering by preventing disease or curing it. But this end cannot be reached except through a scientific understanding of the functions of the organism when they are modified by pathogenic factors.

Today, medicine consists of an immense quantity of observations, partly empirical and partly classified according to scientific method. It is a science in the making. While the treatment of certain diseases, for instance, the disturbances of the pancreas and the thyroid gland, is thoroughly scientific, the handling of others, such as mental diseases, is still entirely empirical. It is obvious that the progress of medicine is bound to the development of the sciences concerned with living matter and living organisms. These sciences, which deal with intricate physico-chemical phenomena and meet with immense technical difficulties, have advanced much more slowly than those which concern themselves with non-living matter and occupy a lower rank in the hierarchy of knowledge. Physiology, which was in its infancy when physics and chemistry were widely developed, cannot as yet supply to medicine in every part of its field the information necessary for the scientific study of its problems. As the physician must help patients afflicted with all kinds of disease, he cannot always remain in the territory which has been scientifically explored. Therefore, his task is very much more difficult than that of the physiologist who can select his problem, reduce it to its simpler terms and solve it by techniques accurately adapted to the subject of the experiments. On the contrary, the physician must wander through the entire field of medicine and often meet with diseases due to unknown causes and developing within an organism of unknown resistance. He is helped by his scientific knowledge as far as it goes. But when he has reached its limit, he has to guess. The great clinician must possess the intuitive power of the man of genius.

*Preventive Medicine Does Much for Human Life*

The past fifty years have been a period of triumph for medicine because the revelation by Pasteur of the rôle of microörganisms in disease has led to the creation of bacteriology and immunology. These sciences have brought about in a spectacular way the conquest of infectious diseases, a fact of momentous importance to humanity. The death-rate of the population of civilized countries has been decreased by better hygiene and efficient protection against cholera, plague, yellow fever, and also typhoid, tuberculosis, et cetera. Not only has preventive medicine determined an increase in the quantity of human beings, but it has allowed profound modifications in their mode of living. Men are crowded into large cities and into factories where they work as part of the machines, without danger of great epidemics and without seriously impairing their health. Immense armies, which heretofore would have been rapidly reduced in size by infectious diseases, are kept in the field for years without large spontaneous losses. The admirable work of Gorgas in Panama has opened a new era in the history of mankind. Life in the tropical climates has been rendered possible for the white man, who has thus acquired the power to dominate the entire world. While the ultimate significance of Pasteur's discoveries cannot be foreseen, it is certain that medicine, in protecting men from infectious diseases, has already accomplished miraculous progress.

*What the White Man Has Done for Tropics*

But we may doubt whether this victory has so far brought much happiness to the world. Has it greatly modified the position of the average man as regards disease and death? Probably not. Although the adult individual has much fewer chances of dying from smallpox, cholera, tuberculosis or typhoid fever than fifty years ago, his expectation of reaching the age of seventy-five or eighty has not markedly increased. But he surely has more prospect of being tortured by some form of cancer, afflicted with slow diseases of the kidneys, the circulatory apparatus, the endocrine glands, of becoming insane, suffering from nervous diseases, or of making himself miserable by his lack of judgment and his vices. Modern medicine protects him against infections which kill rapidly, but leaves him exposed to the slower and more cruel diseases and to brain deterioration.

*Causation May Find a Way to Prevention*

There is no great hope of immediate improvement in this situation, in spite of the remarkable advances which have been made recently in physiology by the discovery of the active principles secreted by endocrine glands, by the building up of the science of nutrition and by a better conception of respiration, of metabolism, of the acid-base equilibrium of the blood, et cetera. Although great progress has been accomplished in the treatment of diabetes and of the disturbances of the thyroid gland, it is far from possible to cure these diseases or prevent their occurrence, as we are still absolutely ignorant of their causation. The insufficiency of medicine is more flagrant when it deals with tumors. What are the determining factors of cancer? What is its nature? What are the causes that render the human organism susceptible to malignant tumors? No one today can give a scientific

answer to these questions. We do not know what brings about arterial hypertension. Our ignorance of the causes of chronic nephritis and of most of the diseases of the circulatory apparatus is practically complete. It is neither possible to cure nor to prevent them. Our lack of knowledge is still greater in the field of the nervous and chiefly of the mental diseases, whose nature remains almost as mysterious as it was during the Middle Ages.

It is clear that the future progress of medicine must consist in finding the nature and causation of some of these diseases and their prevention. Medicine should attempt to lead men to extreme old age without suffering, and also to increase their moral and intellectual value, because the quality of the individuals is far more important than their quantity for the happiness and progress of the community. To expect this from medicine does not appear to be asking the impossible when we consider what has already been accomplished. If our civilization does not crumble, and if scientific research goes on at increased speed, we can reasonably believe that our expectations will be fulfilled. The scientifically organized hospitals, the large medical clinics and their multiple laboratories, the institutes for medical research in this country and in Europe, by merely continuing the investigations in which they are at present engaged, will, without any doubt, immensely advance our knowledge of the nature and mechanism of disease. But fundamental principles have to be discovered; entirely new fields must be opened, and this can be accomplished only by pure science.

Science, when connected with medical research, does not go far enough from the beaten road, and is often handicapped by its attempts to make useful discoveries.

***Pure Science Has No Object But the Truth***

On the contrary, pure science has no immediate practical purpose. Its object is merely to find the truth and to understand the universe. It does not attempt to make discoveries which could be applied to industry or medicine, but seeks an accurate conception of the world in which we live and of our relations to it. Pure science classifies the empirical knowledge of nature that we already possess. Beyond the apparent and often puzzling complexity of phenomena, it detects the common element which underlies their seeming diversity. Then it can draw the generalizations which we call laws and predict and reproduce the phenomena at will. The understanding of nature always has led to its control. Pure science which seeks knowledge in an absolutely disinterested way becomes, almost in spite of itself, the great power of this world. There is no other manner of obtaining a thorough knowledge of nature and of mastering it.

If physiology were studied as a pure science far from hospitals and medical schools, by men possessing the creative imagination and the spirit of the discoverers of the fundamental principles of physics and chemistry, the secrets of the functions of the body that we still lack would be brought to light. These discoveries would indirectly lead the physician to understand the nature of the diseases of the organs whose functions are incompletely known today and to prevent them. This institute of pure science, where physiologists, physicists and chemists could devote themselves to the investigation of fundamental problems, would also create the proper conditions for the building up of the science which will occupy the summit of the hierarchy of human knowledge, the science of thinking matter and energy.

***Nervous System Is the Most Complex***

The development of this new psychology is our only hope of improving the quality of human beings. But it will be an immense task, because the structure of the central nervous system, as unveiled by Ramon y Cajal, is of infinite complexity. It is probable that the discoveries which will open this field to scientific investigation will be made on the frontier of physiology and physics, and will require the development of entirely new methods by some man of genius. Modern psychology, in spite of its progress, will have the same relation to this supreme science as alchemy to the chemistry of our day. Our knowledge of cerebral physiology is in the embryonic stage. We are still entirely ignorant of the properties of nerve cells, the nature of nervous energy and the significance of telepathic phenomena. No one suspects the manner in which memory, intelligence, courage, judgment and imagination are connected with the brain cells. The possible affinity of certain structures of the brain for some chemical substances secreted by endocrine glands and other tissues has never been studied. While courage may be caused by the effect of the sex glands on the cerebral cells, and may not be due to a property inherent in those cells, creative imagination, judgment and other qualities possibly require for their development the action on the nervous system of substances produced in other parts of the body, or possibly introduced into the organism with the food. The knowledge of the conditions that permit the evolution of judgment, imagination, kindness or courage in a race, family or individual, or of the conditions that bring about the disappearance of these qualities, would give the human race far more happiness than the complete eradication of plague, cholera and typhus from the earth. At the same time, the discovery of some of the fundamental properties of nerve tissue would enable medicine to prevent many of the nervous and mental diseases.

***Increasing the Quality of Human Beings***

It is obvious that the functions of the brain must be better understood in order that, without intellectual or moral deterioration, the human race may stand the new conditions of life imposed on the individual by modern civilization. The spiritual progress of man could be greatly promoted by a scientific knowledge of the physico-chemical phenomena which take place within the brain cells. Instead of merely increasing the number of human beings, we could increase their quality. The progress of medicine, understood in this manner, would be the most important factor in the development of civilization. As Descartes wrote, three hundred years ago, we must ask from medicine the solution of the problems which are vital to the greatness and happiness of the human race—"*c'est a la medecine qu'il faut demander la solution des problemes qui interessent le plus la grandeur et le bonheur de l'humanite.*" (Reprinted by permission from *The Scientific Monthly*.)

# My Fiddle and I Since Long Ago

## The Story of "The Trembling String" Sounding Through the Centuries

By CLYDE WIER

ONCE on the road between Chicago and New York a distinguished violinist entered the Pullman and took a seat in my section. He held in his hand a well-worn violin case which he had refused to trust to the sedulous porter. This I eyed for some time with a curiosity akin to longing, for I never let an opportunity to see a great instrument escape. Then I boldly addressed the owner: "Will you please be so kind as to let me see your fiddle?" He gave me a quick glance and then opened the case, revealing a violin at the sight of which I shouted like a child: "O that marvelous Guarnerius!"

Viola d'amore.

From that moment sprang a strange friendship that time has not been able to wither. Now, after long years, as I write I can still see that great violin with its brown breast, and its back thickly covered with a red, velvety varnish that looks dull and intense and smouldering, waiting only for the master's spirit to breathe on it and end the restless sleep of its fire.

Now, had that man been a lesser light, he would, at my request, have stiffened himself in his seat and said, "Sir, I should be glad to show you my *violin*, I have no *fiddle*." And then I should have replied with equal haughtiness that I would spare him the trouble; I had good violins myself at home.

What's in a name? I do not know; but I am certain that although fiddle is as reputable a word as violin, the unenlightened insist on the latter term. Both words seem to enjoy an equal antiquity. Fiddle is akin to the Latin word *fides*, the diminutive form of which is *fidicula*. The player was called *fidicinarius*, and the verb "to fiddle" was *fidicinare*. The cognate Greek word, as old as Homer, is *phormingx;* and that the instrument was regarded with love we know from the adjectives lovely, very lovely, beautifully wrought, highly decorated, et cetera, that attend it in all poems.

On the other hand there are philological experts who say that fiddle comes from the Latin word *vitula*, a calf, and is related to *vitulinus*, of a calf; *vitulor*, to celebrate a holiday. Whether the verb implies eating veal or playing the fiddle they do not make clear in the definition. Whatever it means, it probably went with the Northmen to England where it has lived in good repute ever since.

The word violin is the Italian diminutive *viola*, which is as old as the Italian language itself, and serves as the generic name for the whole viol and violin family. So the name itself is enough to establish the first point of interest in this most human of all instruments—human in its personality, in its pathos, in its frailty, which passes the frailty of women—and that point is its antiquity.

It is believed that the perfected violin, as we know it, was produced about the year 1550. But it may have existed much earlier. If an old manuscript should be found, telling how Columbus fiddled to the Indians, it should give rise to no incredulity on the part of the fiddle lover. Homer speaks of the vintagers gathering grapes while a youth played to them on a sweet-voiced viol and sang to his music a lovely song.

This naturally raises the question of the relationship between the viol and the violin families. The viol is the much older instrument; more uncouth and inartistic. It has since gone the way of all good things that have been supplanted by better things. But just how, when, or why the violin supplanted the viola we shall never know. Some experts tell us that it was a mere matter of evolution; a case of inanimate man from inanimate monkey. And there is certainly as much difference between an old viol and a Stradivari violin as there is between an ape and an Apollo. They are both with us; one triumphs in the museums and the other in the hands of the music makers.

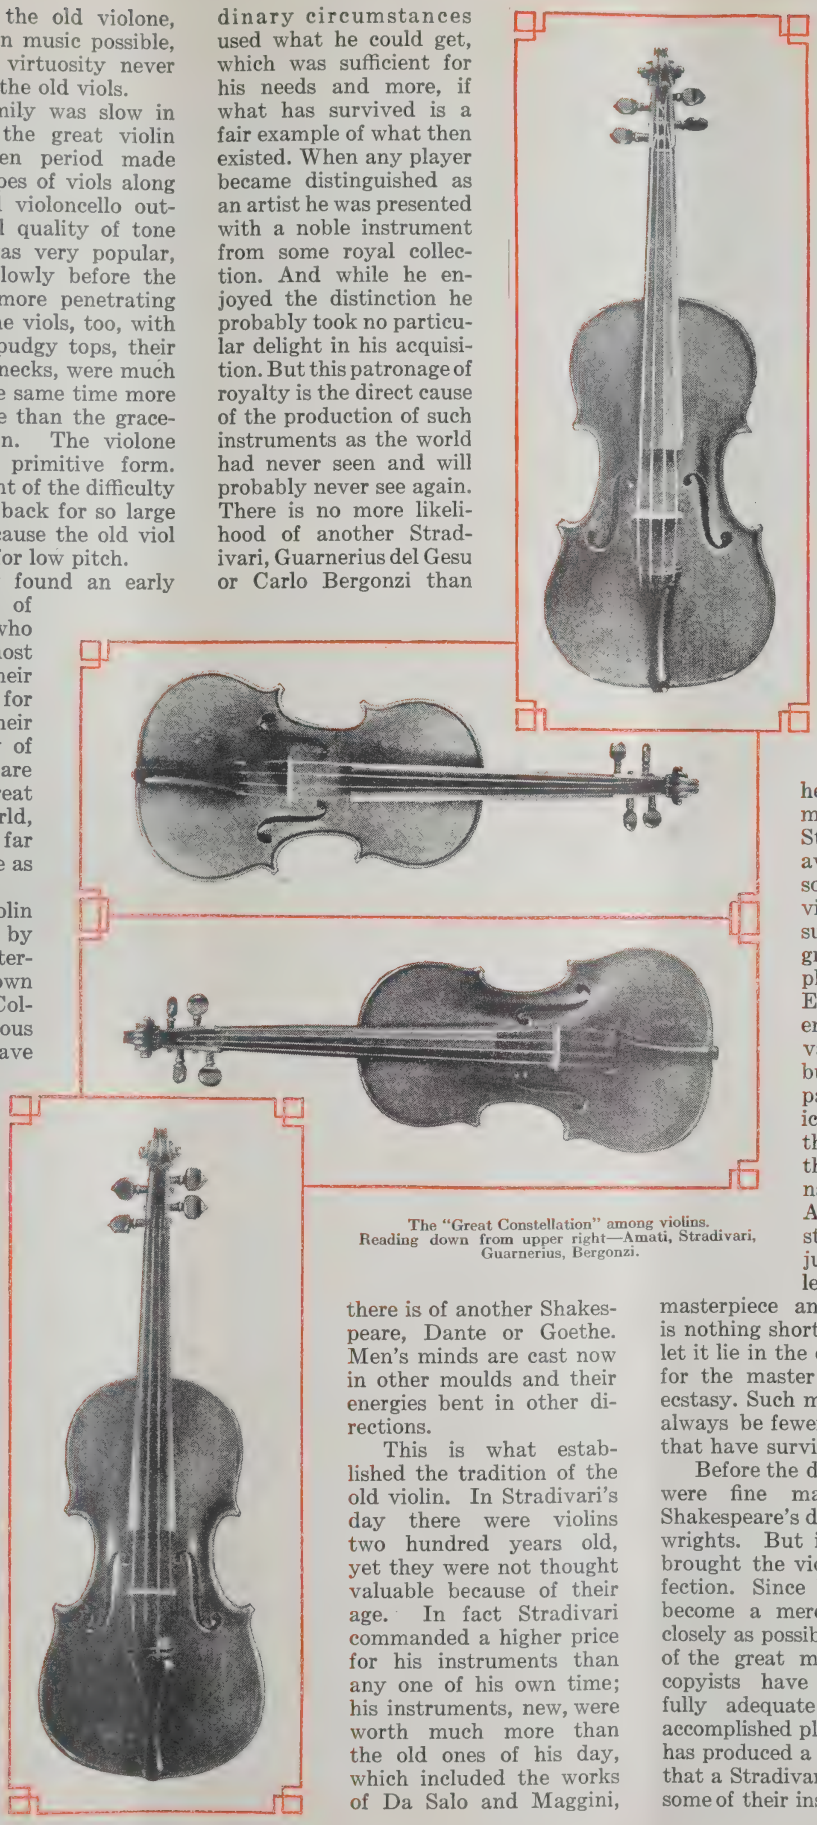
Da Salo viola.

The generic name for the viol and violin families is *viola*. The sole living representative of the viol family to be met with in daily musical life is the base viol. The others have all given place to the stronger voiced violin family, a survival of the fittest, which in the musical world is the loudest.

The oldest violas were instruments resembling in general contour, the large basses of the modern orchestra. They were, of course, more beautifully made and had their sound holes shaped like the letter C rather than like the letter *f*. Their measurements were greater than those of the viola used today, and their voice was of a tenor quality rather than an alto. All other members of the family reveal by their very names the fact that they are afterthoughts.

After the viola had found favor, a need arose for a deep-voiced instrument to accompany it. So the violone (viol+o-ne, big) the double bass, was invented. Its huge size made it very inconvenient to handle and created a demand for a smaller bass, which was met by the viola da gamba, the viola held between the legs. Then there was the lovely voiced viola d'amore, sometimes heard on the concert stage today, and a dozen other modifications, the very names of which are known only to the expert.

But the most important modification was the violino, the dear little viol (viola+ino) which is smaller than the viola and is constructed on an entirely different model, the most important features of which are the change in proportions of the upper and lower bouts, the arching of the back to correspond to the arching of the top, and the improvement in the sound holes. The violin in its turn created a demand for the new viola and the violoncello, the most noble voiced of the entire family. It is this little group, the violin, viola, and vio-



loncello, assisted by the old violone, that has made modern music possible, and given rise to a virtuosity never known in the days of the old viols.

But the viola family was slow in passing. Many of the great violin makers of the golden period made gambas and other types of viols along with their violin and violoncello output. The thin, nasal quality of tone heard in the viols was very popular, and gave way but slowly before the broader, richer and more penetrating tone of the violin. The viols, too, with their flat backs and pudgy tops, their deep sides and broad necks, were much less artistic and at the same time more difficult to manipulate than the graceful and smaller violin. The violone alone has kept the primitive form. This may be on account of the difficulty of making an arched back for so large an instrument, or because the old viol tone is more suitable for low pitch.

The violin family found an early vogue at the courts of kings and princes, who ordered from the most famous makers of their day complete sets for the orchestras and their chapel choirs. Many of these instruments are now included in the great art treasures of the world, and command a price far in excess of their value as musical instruments.

And because the violin family was cherished by royalty it became interesting to men of renown and men of wealth. Collections were numerous and some of them have become world famous. Only among musicians did it remain what its makers intended it to be, a musical instrument. And in the matter of instruments musicians have never been very discriminating. Who made their instrument was never so important as how the instrument felt and sounded.

It took a Paganini to establish the vogue of the great Joseph Guarnerius, although at the time hundreds of his instruments must have been in the hands of competent performers. The finest examples of the art were in the hands of royalty; the musician in ordinary circumstances used what he could get, which was sufficient for his needs and more, if what has survived is a fair example of what then existed. When any player became distinguished as an artist he was presented with a noble instrument from some royal collection. And while he enjoyed the distinction he probably took no particular delight in his acquisition. But this patronage of royalty is the direct cause of the production of such instruments as the world had never seen and will probably never see again. There is no more likelihood of another Stradivari, Guarnerius del Gesu or Carlo Bergonzi than there is of another Shakespeare, Dante or Goethe. Men's minds are cast now in other moulds and their energies bent in other directions.

The "Great Constellation" among violins. Reading down from upper right—Amati, Stradivari, Guarnerius, Bergonzi.

This is what established the tradition of the old violin. In Stradivari's day there were violins two hundred years old, yet they were not thought valuable because of their age. In fact Stradivari commanded a higher price for his instruments than any one of his own time; his instruments, new, were worth much more than the old ones of his day, which included the works of Da Salo and Maggini, who rank still among the great masters. Now, a concert player is ashamed to perform on a violin made later than 1800. That is not because all violins made since then are bad, but because it is considered the thing, and the only thing, to play on an old master instrument. There are many new violins that are equal to the needs of the most eminent artists. Moreover, very few of the eminent artists of today are worthy of the great masters. Kreisler, who plays a Stradivarius, is one of the very few who deserve such an instrument.

A player needs an instrument that will express what he has to say; anything more is superfluous. A Stradivari played by the average student will sound like a student violin; no one would suspect that it was a great Cremona. The plaintive sweetness of Elman's tone is certainly enhanced by the Stradivari on which he plays, but there are depths of passion in that magnificent specimen, one of the best in the world, that a man of Elman's nature can never explore. A less distinguished instrument would serve him just as well. And for a lesser light to have a great masterpiece and abuse it day by day is nothing short of criminal. Far better let it lie in the collector's safe and wait for the master touch to wake it to ecstasy. Such masters are few, and will always be fewer than the great violins that have survived the shock of years.

Before the day of Stradivarius there were fine makers, just as before Shakespeare's day there were fine playwrights. But it was Stradivarius who brought the violin to its ultimate perfection. Since his age the artist has become a mere copyist, imitating as closely as possible the model and details of the great masters. Many of these copyists have produced fine violins, fully adequate to the demands of accomplished players, but none of them has produced a great violin in the sense that a Stradivari is a great violin. Yet some of their instruments are such close

copies that they sell on the market for the genuine Stradivari, with little danger of detection.

How many of us know the best in art in any field? And who has had an opportunity to train his eye and ear on the great master?

The opportunity to train the eye is becoming more and more remote, but it is possible for one who has a discriminating ear to learn much about the tone of famous instruments. The phonograph is the most available help. A Kreisler record will reveal the reedy lusciousness of tone characteristic of Stradivarius. Maud Powell's tone will sound less reedy; its characteristic is a sort of vitreous clarity that is peculiar to the Guadagnini; Elman's record will show Stradivari sentimentalized. Of course it is much better to hear the players themselves, but that is too seldom possible.

***Different Ways of Playing a Violin***

One notes after much experience that the fine Italian instrument, made for the emotional Italian, suffers more or less at the hands of the foreigner. For example, a Frenchman plays with great skill but with too much intellectual repose, a Jew plays with whining saccharine voice or the exaggerated pathos of a street beggar; only at rare intervals do we hear a man evoke from the instrument all the variety and wealth of beauty that lies sleeping within.

It is easy to see that the violin may be considered from two rather widely divergent viewpoints: as a musical instrument and as an art treasure. The demand for the first is more easily satisfied than the sentimental or the temperamental will admit. The seeker for a suitable instrument on which to play can hunt among the professional players until he finds a fiddle that pleases him; then he can bribe the owner to surrender it, knowing inwardly that the bribe must be much greater than the intrinsic value of his "find." Or he can go to a dealer and from him purchase for five times its worth a fifth rate old instrument that happens to be for sale. Or he can secure from the same dealer for about twice its value, a new instrument made in Mirecourt or Mittenwald, play it and await developments. Or, finally, if he is not in a hurry, he can get a reputable maker to build him a fiddle, and again take his chances on the outcome.

The great masterpieces are all sold, and the owners are satisfied; so in the market there is little fluctuation. What five hundred dollars could buy twenty-five years ago five thousand will not tempt today. Why? The question is simple, the answer rather complex.

In the first place a genuine Italian instrument of first or second rank is so superior to all others of any age or date whatsoever that there is absolutely no competition. A well-preserved Stradivari gives a great artist the advantage that a hundred million dollars gives the man of business. And now that some of these same millionaires have turned their attention to collecting fiddles, the fiddler with the fiddler's wage is going to find the quest for such an instrument increasingly difficult, if not altogether hopeless.

***Collecting Fiddles as a Hobby***

But he need not despair. As we know, the average musician has never had better than the average instrument. And today the crop of average instruments is large. Moreover, there are many excellent makers in the world today, both in Europe and America. Almost all of them build on the best models, use good materials, and are clever workmen who are anxious to make a reputation.

The American instruments are, many of them, honestly built, and have the great advantage of being to the climate born, so they are less liable to dry out and check, become nasal, or develop a shriek. It is, of course, of the utmost importance to be sure about the skill and intelligence of the maker; a man deficient in either skill of hand or creative instinct can never make a distinguished fiddle. Of course right here lies the great difficulty. How is one to determine the question of skill and intelligence, when each individual maker is loud in the assertion that his is the one true genius, and wisdom will die with him?

Well, somehow it is always settled. And when the proud owner takes home his new instrument he should proceed at once to educate it. Scale practice will bring out the tone; it is good for the instrument and good for the player. After it has, in automobile language, run its thousand miles, it will be somewhat played in, and will delight the audience, at any rate. This should please the performer, for he never hears himself as others hear him. An instrument that sounded as pleasant under the ear as many instruments sound back in the hall would not be heard to advantage ten rows back. In the end a new instrument will be far more satisfactory than one of those old multi-cracked, many-patched wrecks from the shop of antiques. Let him have those who in his inexperience knows that the old instrument is the best; he has not played a new one and unfortunately never will.

The field of art is altogether different territory, and the collector who gathers from it a dozen or more authentic specimens and preserves them intact for a generation or two is one of the world's benefactors; and this in spite of the hue and cry that is raised against him by those who insist that fine violins should be in the possession of men who play them. The trouble is, the field fairly bristles with obstacles in the form of hopeless fakes. An instrument to qualify as a work of art must be unmistakably authentic; and it must be moreover the work of one of the few great makers.

***Field Bristles With Hopeless Fakes***

The Amatis, the Guarneri, Stradivari, Carlo Bergonzi—these are the great constellations. Then going back beyond these we find Paulo Maggini, and back of him Gaspar da Salo who might be considered the father of the violin as we know it. Coming on this side of Stradivari we find the Guadagnini, the Gagliani, and Laurentius Storioni, the last of the great Cremonese. As a sort of afterthought, come Pressenda and Rocca. There are many points to be noted in the work of these makers—the few points of similarity and the many of divergence. None but the greatest connoisseurs can note them all, and connoisseurs are not met with in the ordinary channels of intercourse.

The careful student might note the models, the varnish, and the workmanship. Books by the score have been written on all of these subjects, all of which one might read without adding to his ignorance. There is nothing more hopeless than reading about such things unless it be writing about them. Who can describe the arch of a Stradivari top, or the varnish on the back of a Joseph Guarnerius, son of Andrea? Certainly I shall not attempt it. The point is this: each maker is different in many details from all other makers.

# When the Stars Foretell Trouble

(*Concluded from page 8*)

pointed out that his election was assured.

"I do not pretend to have supernatural power," Dr. Brooks declares, "or to be a soothsayer or anything of the kind. Astrology is an exact science, and those who have studied it know that it cannot fail if interpreted rightly. Give a series of charts to a dozen astrologers, and every one of them will read them the same way and make the same predictions."

Asked for the exact procedure in arriving at his "prophecies" Dr. Brooks said:

"It is purely a matter of mathematics. In simple language, a chart is first calculated for the day, the month, year, hour and place of any event according to the definite laws of astrological procedure. This chart is in reality a map of the heavenly bodies for a given time and place. It is interpreted according to the position of the heavenly bodies in relation to the signs of the zodiac, and the angles of the chart together with such configurations as conjunctions, positions, squares, trines and sextiles of one planet to another."

When seventeen, Dr. Brooks began to be interested in astrology. He came in contact with a clergyman who was a student of the stars, and fell under the guidance of this man.

In 1921 Dr. Brooks first made public his astrological predictions. The writer saw letters of approval to Dr. Brooks from men in high political, educational, theological and literary life, among which are several from the White House.

# "Conscience Money" and the Indemnity Bond

"MY BOOKKEEPER got away with $100,000 in cold cash last week," the employer explained, "and I hold your surety bond for $25,000."

"Why didn't you notify us before?" the Indemnity Company demanded.

"He went away Friday night, and we didn't have the slightest suspicion there was anything wrong till we got a letter from him this morning."

"Got a letter?"

"Yes, he wrote a full confession, said he didn't feel right in making such a big pull, and inclosed the key of a safety box were we found $50,000 of the stolen funds."

"Well, that's certainly fine for us."

"How so?" the employer demanded.

"Clause 17 of the policy says that both parties shall share any recovery made by either on account of any loss in the proportion that the loss of each bears to the total loss."

"And how would you figure that out?"

"Easy enough. One quarter of the $50,000 'recovery' comes to $12,500, deduct that from the face of the policy, and it leaves $12,500 for us to pay."

"Yes, but you insured me up to $25,000 and I lost just double that amount."

"You've overlooked the 'recovery clause' in the policy."

"That clause doesn't apply to 'conscience money' that the embezzler pays back voluntarily," the employer argued, and the Wisconsin Supreme Court ruled in his favor.

DISTRICT ATTORNEY BAKER has the desire to do what is right. He cannot be purchased at any price. He is backed in Schoharie County by a Law and Order League which has more than two thousand members. Furthermore Schoharie County has a Supreme Court Judge who believes that people shall abide by the law. It is believed that these three features combined in any locality will put the fear of the law into any criminal and will greatly reduce crime.

# Prohibition Can Be Enforced

## Ask the People of Schoharie County

TRAVEL where you may in Schoharie County, in New York State, you will not hear it contended even by the bitterest enemies of prohibition that the law cannot be enforced. These people give vent to their feelings in another way, namely, by cursing the law and the officers and citizens who enforce it. For the Volstead Act *is enforced in that county, and let there be no mistake about it.* Schoharie County holds itself up as an example of the fact that the National Prohibition Law can be enforced as well as any other law—as well as the laws governing larceny, assault, or murder.

The crusade to close up the places where intoxicating liquors were sold in this county began about a year ago, when Alberti Baker, the district attorney; Preston Kennedy, a husky evangelist preacher; George Oliver, a deputy sheriff, accompanied by a Federal officer with a search warrant, entered one of the largest and most popular hotels in the county, took possession of the bar and liquors, arrested the owner and proprietor, urged and procured a speedy arraignment of him in the Federal court, which resulted in his plea of guilty and a fine, and the commencement of padlock proceedings against him, as a result of which he disposed of the hotel and left the state.

Under the present ownership and management the bar and bar fixtures have been removed, and in their place are soda fountains and ice cream tables patronized by children and women. As a booze place the hotel is a thing of the past.

The result of this raid and cleaning up was that dealers in illicit liquors began to sit up and take notice.

Section 22 of the Volstead Act provides as follows:

"An action to enjoin any nuisance defined in this title may be brought in the name of the United States by the Attorney-General of the United States or by any United States Attorney or *any prosecuting attorney of any state or any subdivision thereof* or by the commissioner or his deputies or assistants. Such action shall be brought and tried as an action in equity and may be brought *in any court having jurisdiction to hear and determine equity cases.* If it is made to appear by affidavits or otherwise, to the satisfaction of the court, or judge in vacation, that such nuisance exists, a temporary writ of injunction shall forthwith issue restraining the defendant from conducting or permitting the continuance of such nuisance until the conclusion of the trial."

Under this provision of the Volstead Act the district attorney began a general crusade to make the county absolutely dry. He personally conducted raids and searches, aided at times by his son Richard, a senior in Harvard, during the vacation period, and by local and Federal officers, at times engaging in personal encounters, for the purpose of obtaining evidence upon which to base the injunction, or padlock action under the section quoted.

At the county seat, Schoharie village, there had existed for a half-century on the main street, alongside the only bank in the village, directly across from the courthouse, a saloon which had been wide open, not only during the days when the law permitted it, but even on Sundays, long after the Volstead Act was passed.

On a late Saturday evening last April this same preacher, the district attorney, his son, two live-wire young Federal officers, and two state troopers, entered the barroom of the saloon, took possession of it, searched the bar and the customers present, found intoxicating liquor not only in the bar but on the patrons, arrested the proprietor and his bartender, caused them to be prosecuted in the Federal court, and with the evidence brought an action in equity, and in less than two months had the building closed. It is now being used as an electrical store and shop.

This was the first action of the kind brought in the state courts of New York, and Hon. Charles E. Nichols, of Cobleskill, New York, was the first justice of the Supreme Court to grant an injunction and judgment in such an action in the state. The action was contested, but under the law, it not being triable by a jury, justice moved rapidly.

*There has not since been seen a drunken man on the streets of the county seat.*

Since that time at least a half-dozen raids and searches have been made and many places closed. Some of these were large hotels and one or two private residences. The actions have been expedited by bringing them in the state court instead of in the Federal court which was crowded to capacity, and by the state court being nearer and more accessible, and holding its terms more frequently. All the orders and judgments in these cases were made by Justice Nichols, who sat during a portion of his vacation period to hear the testimony.

As a result of these actions several other dealers in illicit liquors went out of business, some of them leaving the county. There is not now a public place in Schoharie County where intoxicating liquors are being sold. It may be that now and then there may come to light a place where an individual has made homebrew, but such places are quickly closed and the booze confiscated.

Drunkenness in this county is a thing of the past. The county fair is held at Cobleskill in October and continues for four days. It is patronized by thousands of people. It is said that at the last fair there was an entire absence of drunkenness.

Said the district attorney: "Schoharie County is not different from a majority of the other up-state counties of New York, nor do I believe it is different from other counties in other states, barring those containing the larger cities; and I undertake to say that by the simple, direct method pointed out by section twenty-two of the Volstead Act the illicit trafficking in intoxicating liquors can be stopped. At least the National Prohibition Law can be enforced as well as the majority of other penal laws.

"Of course, attorneys must devote some time to the prosecution of the cases; at the outset bootleggers and rum-sellers must be handled with a drastic hand; and when they see that the prosecution is in earnest and that no favors are to be shown, they will yield as quickly as any other class of criminals. In my county they have become submissive. I do not beg them, I do not deal with them. I have come to the point where I can defy them. Since the people have seen that I am in earnest and am desirous of stamping out a great evil, they have come to my rescue, and they are with me and aid me whenever they can. I am sure this will be the case in all the counties here-

about. I know the neighboring counties of Delaware, Otsego, Greene, and Schenectady and am satisfied that the citizens will support the prosecuting officers in closing the liquor places."

In Schoharie County the people have recently organized a Law and Order League. It has a large membership made up of the county's best citizens, including the entire membership of the Harder Manufacturing Company of Cobleskill, nearly all the clergy of the county, physicians, merchants, lawyers, many farmers, the district attorney and sheriff. The president of the league formerly resided in New York City. He is Charles Gardner, police justice of the village of Middleburg.

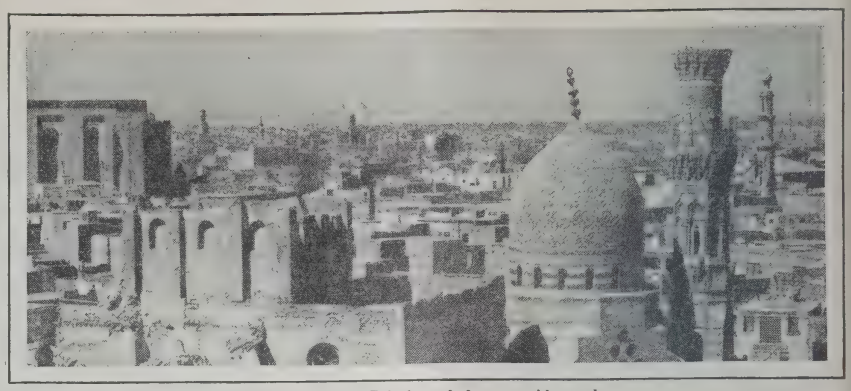
Mr. Gardner frequently assists in searching places against which complaints have been made, for the purpose of procuring evidence. Meetings of the league are held in the courthouse and in churches.

In every community like that of Schoharie County there are large numbers of men and women who are strongly in favor of seeing the Eighteenth Amendment enforced. Little enthusiasm will be shown, however, where little is being done in the way of law enforcement by the officials. But quite naturally when the prosecuting officers show zeal and interest and get results, popular enthusiasm will become manifest. It will show itself by the offer of aid to the prosecuting officers and by organizing in the way Schoharie County has done.

In Steuben County in New York State, the district attorney has already followed the lead of Schoharie and is prosecuting under the section of the Volstead Act referred to. Steuben's citizens have also organized for law enforcement.

It will be readily seen that the injunction, or padlock order, must have a salutary effect on the offender. A fine may deter for the moment, but it is of little consequence in view of the enormous profits received in the sale of liquors. Jail sentences may prevent for a season, but such sentences are usually short, except in the cases of extreme violation.

In the case of the closing of the building, however, a different situation arises. The property of the owner or tenant is rendered useless for a time and the occupant is out of business.



In the Schoharie County padlock cases the judgments provide that there should be posted, on conspicuous parts of the closed building, notices containing the following words: "Closed by Order of Charles E. Nichols, Justice of the Supreme Court." The judgment has been complied with in each instance

## The Star Cluster *Hercules*

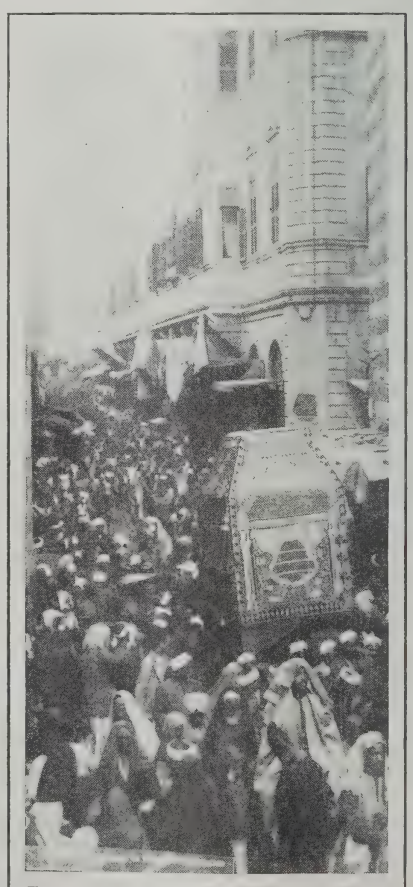
A PHOTOGRAPHIC image of the star cluster *Hercules* looks merely like innumerable splotches of white on a black background. But scientists have counted more than 30,000 stars, each many times larger than the earth's own sun. The most luminous giants in the group exceed a thousand suns in light emission.

The *Hercules* group is so far distant that it requires 36,000 years for its light to reach the earth.

Dr. Harlow Shapley has afforded a new and startling conception of the magnitude of the physical universe. He estimates that the now known stellar universe is about 100,000 times larger than had been suspected previously.

Looking across Cairo's roofs from an old temple.

# The Ways of the Egyptians



By WILLIAM H. WORRELL

THE old woman in Mohammedan Egypt is a pitiable object. She enjoys neither confidence nor respect. She is the butt of ridicule, the symbol of ugliness, intrigue, and malevolence. In one story we are told that the devil himself is afraid to come to Cairo for fear of meeting a certain old woman there, whose conduct shocks him so. In point of fact, however, the old women of Egypt do stir up a lot of trouble in families, carry a lot of tales, and, all in all, interest themselves far too much in matters of men and women.

Good-natured as the Egyptian is, he quarrels and fights a great deal, because he is simple-minded in his natural human selfishness. But when he fights he takes care not to hurt anyone much. Usually he grasps his opponent by the collar, and twists it, meanwhile calling upon the Prophet and the true believers to witness his wrongs.

Beneath my window in Cairo a woman with a tub of wet wash on her head collided one day with a man similarly carrying a pan of hot baked beans. The woman addressed the man for ten minutes in the presence of a large and appreciative street audience, and never repeated herself once. Peacemaking is a common activity among well-intentioned people; and it works surprisingly well. I knew a man who went regularly every morning to be slapped in the face by another because a quarrel with that man had once brought him a piece of good luck. Being superstitious, like all Egyptians, he argued that more slaps would bring more good fortune.

When life has actually been taken, however, the Egyptian is implacable. Social custom and religion demand this. There is then a blood-feud, which differs little from the same sort of thing in Kentucky or anywhere else. Such a feud was started in the village of Hawatka by the death of a Moslem through the falling of a roof-tile from the Coptic church. The first Christian whom the relatives met had to flee for his life. In view of such possibilities families and religious communities in the villages live in quarters which can be barricaded and defended if necessary. In case of a feud, "if your life is long," says the Egyptian simply, "why then you will not be killed."

Crowds in an old Cairo street.

When I came, after an interesting sojourn there, to leave Hawatka, social relationships became complicated. The Khawaja (myself) did not give away any of his "six pairs of shoes" (one pair being rubber overshoes). He refused outright to cure with his pills an old man who had been blind from birth. A can of American salmon which he had presented to the sheik was declared to be poisoned. He had scattered no gold pieces, though it was known that he had brought with him from America a whole sailboat-load of napoleons.

All this ingratitude after my dispensing quarts of tablets of *Cascara sagrada* to groups that waited all day upon my bounty!

"Nan-T'ien-Men" or the "South Gate of Heaven." This gate is beautifully built and is at the top of Taishan.

# Mount Taishan, Oldest Worshiping Place on Earth

By CAMERON WILKIE

HUMAN beings are incurably religious. Some writer has said that.

Carlyle says that the chief thing about any man is his religion.

In some way or another men have always worshiped; first the world of nature—wind, stars, streams, the ocean, the hills, the storms—and then through the centuries they gradually got to worshiping one God.

In China is old Mount Taishan, which is said by historians to be the oldest worshiping place on the face of the green earth; older than Egypt, older than the temples of Mexico, older than Assyria and Babylon.

And to add to the interest in this ancient mountain of China, it is located on the Shantung Peninsula, that much-discussed and much-disputed strip of land which Germany took from China; and which then was given to Japan by the Versailles Treaty, but which has been given back to China by Japan.

Shantung is called "The Holy Land of China." Why? Because it is the birthplace of Confucius, and the burial place of this same philosopher. Also because it is the location of the old sacred mountain that I climbed and about which I write.

We were a happy crowd that climbed the six thousand stone steps to the top of old Taishan. There were about fifty of us. We had just visited the birthplace and burial place of Confucius, the Chinese sage, and it was quite natural that we should be more or less thrilled at the thoughts of a climb to the top of that great mountain where human beings are said first to have worshiped.

Old Taishan is south of Tsinan. It is the beautiful, outstanding peak of a range of hills, and in wintertime it is always crowned with snow.

The work of engineering and building that stone stairway of six thousand steps could have been no child's play, as one of our party, an engineer, told us. The way winds along a mountain stream part of the time, and these granite steps, smoothly carved, are so old that no historian knows who put them there. Each step is from six to twelve inches high. Hundreds of thousands of pilgrims make this ascent every year.

Confucius climbed this mountain in his bare feet and worshiped from its highest eminence. On the top of the mountain there is a stone shaft beside which I stood with a sense of reverence. Carved upon its plain surface in Chinese characters is this sentence:

"Confucius stood here and felt the smallness of the world below."

No wonder the great sage felt the smallness of the world below, for, of all the beautiful views from great heights I have ever seen, this is unsurpassed.

The whistle of a locomotive coming faintly from the valley below seemed out of place. The thrill came when one added to the beauty of the view the consciousness that one was standing on a spot where men and women had come to worship three thousand years before the Christian Era; when Europe was a wilderness, and when the Mound Builders were the dominating people of our American continent.

The Chinese coolies who carried us up that mountain in their chairs were a happy lot.

The chairs in which we were carried part of the time were borne by two coolies, who, when they were tired of walking one way, would swing you around as if you were a feather; and they seemed to arrange that swing just when you were hanging over a precipice.

On the way up Mount Taishan. It's hard to climb a mountain like this.

Personally I did not use my chair much, only now and then on an easy slope. The coolies looked me over when I employed them that frosty morning and told my friend, who could speak their language, that they would have to charge an extra dollar to carry "the colossal one."

I paid the extra dollar and the rest of the party had a lot of fun at my expense calling me "the colossal one."

All the way up this steep granite trail, there are two distinct features: Hundreds of beggars who live along the way, year in and year out; nice sleek, fat beggars who make their living that way—and, I presume, send their sons to college. They get money from tourists and from native pilgrims who come by thousands each year to renew their vows. In the period immediately after the Chinese New Year as many as a hundred thousand pilgrims a day ascend Taishan.

The other feature of the climb up the mountain is the series of beautiful gates and arches that mark the ascent, and through which all of us had to pass to get to the top. Each gate has been erected in commemoration of some great dignitary making the climb, or has some religious significance.

The first great archway is called: "I-T'ien-Men," or the "First Heaven Gate" and is a magnificent piece of architecture. There is also a statement carved on its enduring granite that Confucius passed through it when he climbed Mount Taishan.

"The Flying Clouds Hall" is one of the temples on the way up which attracts attention. "The Ten Thousand Genii Hall" is another shrine on the way commemorating the fact that Emperor Kao-Tsu stopped here on his ascent in A. D. 595. "The Temple of the Horse Stopping Place" and "The Temple of the Horse Turning Back Peak" are two of the halls along the way.

At the top is the "South Gate of Heaven." Beyond that is a bridge that is called "The Cloud Stepping Bridge."

From the "Nan-T'ien-Men," or the "South Gate of Heaven," it is a half-mile to the Taoist temple which is the crown of old Taishan, and the mecca of the pilgrims.

The last gate is the "South Gate of Heaven." There are something like fifty steps that lead directly up to this archway and they are so steep that it seems almost as if one were climbing a ladder.

The climbing of Mount Taishan made one think of the "Songs of Ascent" which the ancient Hebrews used as they marched up to the Temple in Jersualem, and up the Mount of Olives. It recalled Sinai and Horeb, for men and women have always liked to build their worshiping places on stately heights.

# Wilson's First Night in Paris

(Concluded from page 3)

had expressed to his old friend from home. He had merely put off and put off the suggestion, in the hope that the plenipotentiaries would soon be at the Peace Table and that the demand for his trip would be forgotten.

By early January, upon his return from England, the insistence had become so great that he decided for tactical purposes he must visit the war region. He would not have done so except that he found that his evasion was making the French suspicious of him and thereby lessening his influence. He knew he had a hard job ahead to bring France to accept conditions which Germany might possibly be able to fulfill. To still the clamor, therefore, he made a hurried trip to Rheims, Chateau Thierry, and Belleau Woods. He left Paris after breakfast by motor and was back for dinner, but the French demand was satisfied. He had seen the devastated regions—a tiny part of them.

But Mr. Wilson's thoughts that night were concentrated on keeping cool. His actions were well in keeping with his thoughts. He had done all the thinking and planning that was possible in calm, imperturbed America. Now he was in the center of cross currents of hate, ambition, jealousy and altruism. To keep cool, he switched his thoughts back home.

Before him was a cross-ruled sheet of paper on which he was working when his old Washington friend called. He was sitting at a table in the center of the room, with Mrs. Wilson opposite him. He had cleared a space in front of him and had made the lines and cross lines on the paper himself, in his careful, accurate way. He had been filling in the spaces made by the cross ruling, setting down precisely drawn numbers with a finely pointed pencil. At the time his caller entered he and Mrs. Wilson were seriously discussing these numbers. Down the left-hand side of the sheet was a column of geographical places. Across the top was a list of queer headings. The whole, without the numbers which had been inserted, was as follows:

| | Freedom | Intellectual Advantages | Social Advantages | Recreation and Amusement | Climate | Average |
|---|---|---|---|---|---|---|
| New York | | | | | | |
| Washington | | | | | | |
| Richmond | | | | | | |
| Charleston, S. C. | | | | | | |
| California | | | | | | |
| Bermuda | | | | | | |
| Boston | | | | | | |

As the caller cast interested eyes at the strange document Mr. Wilson smilingly confided its import. He and Mrs. Wilson, with Paris gone mad at their front door, were discussing where they would live after

President and Mrs. Wilson on Liberty Bell Rug, at Versailles Palace.

March 4, 1921. Mr. Wilson had conceived the idea of reaching a systematic, scientific determination of the relative advantages of the various places which they thought they might like. Instead of guessing in a hit-and-miss fashion they had, first, set down the seven places for which they felt some attraction. Then they had classified the things which they desired in any place, putting freedom first, followed by intellectual advantages, social advantages, recreation and amusement, and climate. Using 100 per cent as perfect they set down a percentage for each place under each heading, added them together and divided by five, to get the relative average advantage of each.

For example: Boston was rated high in intellectual and social advantages but low in climate and freedom, while California and Bermuda were listed high in climate and freedom and lower in other respects. Neither Mr. nor Mrs. Wilson seemed to be conscious of the fact that the whole world was trembling with expectancy over the official acts of the American President, to be launched on the following day, or that the organization of the civilized world was destined to be affected, probably for all time, by his policies to be promulgated within a few hours. Joy-maddened Paris would have been surprised if it had learned that the President and his wife were sitting in the middle of the capital absorbed in the debate of whether Boston should be rated 87 or 88 per cent in intellectual advantages and whether Richmond should be given 50 or 52 in climate—

"If you can think—and not make thoughts your aim;
If you can meet with Triumph and Disaster
And treat those two imposters just the same . . ."

—If Mr. Kipling could have looked into the library of Prince Murat's palace that night he would have seen the thought in those lines of his personified.

# The Story of the Submarine

THE idea of being able to propel a boat through water, beneath the surface, has long engaged the attention of men.

Aristotle describes a vessel of this kind which was used in the siege of Tyre, more than 2,000 years ago. Calluvius is said to have invented a submarine gun, or under-surface weapon, for the propulsion of the famous Greek Fire.

In the sixteenth century, one Olaus Magnus, the bishop of Upsala, gave a description of some leather skiffs, or boats, which were used to scuttle ships by attacking them from beneath, two of which he claims to have personally examined.

"There were pirates in Gruntland," he says, "who employed boats and vessels made of skins for traveling wherever they wished, either above or below the water, and by means of such they pierce and make holes in passing merchant ships."

An Englishman, William Bourne, in 1579, patented a submarine of his own invention. It was designed for Buckingham's expedition to the Isle of Rhé. It was fitted with leather joints so arranged that they could be made smaller or larger by the action of screws. It used water as ballast, and had an air pipe for a mast. There is no evidence that it was put in commission.

In 1600, a Dutchman by the name of Cornelius van Drebbel produced several submersible vessels. He claimed to have discovered a process whereby he re-oxygenated air, which enabled the boat to remain for a long time under water.

In 1773, an American named Bushnell invented his famous "Turtles." They were small, upright boats, in which a man could sit, and submerge himself by means of leather bottles, which had their mouths projecting outside. An attempt was made to blow up an English fleet with these boats, each of which carried a torpedo, but it was unsuccessful.

Various attempts to build a submarine boat, that would be practical, were made in various countries from the time of Bushnell down to 1887, when Holland produced the boat which bears his name, and from which the present submarine, with its high degree of efficiency, is an offspring.

# North Carolina Crushes Mob Rule

(*Concluded from page 7*)

in Asheville, in November, 1925. A series of heinous crimes had been committed there and the spirit of resentment against the perpetrators was at white heat. Following the arrest of a Negro suspect, an unsuccessful effort was made to storm the Buncombe jail, where he was thought to be confined, in order that he might be removed and lynched. But the Negro was not there. He had been removed for safe-keeping. Later, a second Negro was arrested charged with a capital offense against a white woman.

When the Superior Court met to try these cases, Governor Angus W. McLean ordered the adjutant general to proceed to Asheville, with definite instructions to take charge of the situation and preserve order at any cost, calling to his assistance as many state troops as should be necessary. Two units were summoned and served until the trials were concluded.

One of the Negroes was convicted and sentenced to be electrocuted. Twenty-nine white men who were alleged to have been leaders of the mob that attempted to take him from jail, or would have attempted it if he had not been removed, were placed on trial. They were not tried for taking the Negro, because they did not get him, but for taking *the law* in their own hands. Eleven were convicted and nine pleaded guilty. Four were sentenced to terms in the state's prison and eleven to terms on the county roads. Suspended sentences were imposed on the remaining five. The most remarkable thing about the whole proceeding was that one of the Negroes was acquitted, even though the community was stirred up to a point where it was thought that troops might be necessary to preserve order. This Negro was tried inside a circle of bayonets. The governor, sending the troops, had declared that the law must take its course. Although he was identified by the prosecutrix, the prisoner set up an alibi that stood the test and was believed by the jury. He appeared in court without counsel, and Judge A. M. Stack, presiding, appointed G. Lyle Jones, a former state's solicitor, to defend him. Although it did not know what effect its action might have, the jury acquitted the Negro and he was afforded protection until he could leave the community.

Judge Neil A. Sinclair, who imposed on indicted mobmen sentences as high as thirty years in prison.

From the bench Judge Stack made the following comment:

"That was the worst mob I ever heard of. God save the state that has to depend upon mobs to protect its women. The women of North Carolina do not have to depend upon mobs for their protection; the law will attend to that. What the officers needed down there that night were a few machine guns. North Carolina must put more red pepper in its handling of criminals."

When the doors of the Buncombe County jail closed behind the convicted and sentenced mobmen, North Carolina, in its persistent fight for the abolition of mob violence, had won a notable victory. It had sternly contradicted the erroneous impression so often expressed in many sections that a Negro could not get a fair trial in the South; it had set at rest any remaining doubt as to whether mobbers could be convicted.

Although six thousand persons signed petitions asking executive clemency for the self-confessed and convicted Buncombe County mobmen, Governor McLean, on February 10, 1926, flatly declined to interfere with the prison sentences that had been imposed. Petitioners informed the governor that the families of these men were suffering. Whereupon, the chief executive officially called on the mayor of Asheville to seek aid for them in that community, informing him that in case this plan did not work he (the governor) would help him to secure outside aid.

"I regard these cases as of unusual importance," Governor McLean wrote the Asheville mayor, "because they represent a concrete example of law enforcement. While the law must be vindicated by the punishment of those who showed contempt for it, consideration must be shown to the innocent members of their families who are likely to experience inconvenience during the time the necessary processes of the law are in operation."

Governor McLean's statement, issued when he definitely and finally refused to extend clemency to the imprisoned mobmen, will go down as one of the really great state papers in North Carolina.

"The families of these prisoners have my deepest sympathy," declared Governor McLean. "It is an unpleasant duty to decline these applications with the full knowledge of the distress that may result even though the prisoners themselves be responsible. I am sure the good citizens of Asheville, the churches, the civic organizations and others interested in human welfare will see that these unfortunates are provided for."

Then, the governor turned his guns on lawlessness, and declared:

"When the State of North Carolina takes a prisoner into custody it then becomes responsible for his safety and that responsibility remains until his case is disposed of in accordance with law.

"A prisoner in custody of the law is entitled to the same protection as is the judge on the bench, or the solicitor who represents the State in the prosecution!

"In this instance the State of North Carolina went to great expense in order that the prisoner in question might be given a fair and impartial trial. The National Guard of this State was called into service at the expense of the taxpayers. The prisoners (mobbers) sought to destroy the very process of government on which they now rely. The governor is the instrument of the law just as the jail is the instrument of the law. They were given a fair and impartial trial and convicted by jurors chosen from their fellow men. The sentences imposed, it seems to me, were eminently fair and just and might easily have been more severe.

"Those who are asking for clemency for these men should remember that the crime they committed was one of the most serious known to our law—serious because the sovereignty of all the people of the State

"There shall not be a lynching while I am governor, if within my power to prevent it," vows Angus W. McLean, Governor of North Carolina. He ordered special terms of court for trying mobmen after he had offered rewards for their capture.

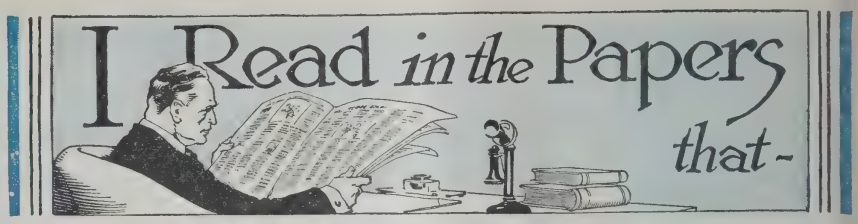
was trampled underfoot and insulted by the mob when it attempted to take the law in its own hands. "In a democracy like ours, the laws and the courts set up for the enforcement of the laws represent the true sovereignty of the people, because the people can only express their sovereignty through the laws that are enacted by their representatives for the protection of society.

"No question of mere sentiment should enter into a case of this kind. Sentiment should be all upon the side of the people whose sovereignty was insulted. No man can calculate the damage that may be done to the good name and fame of North Carolina by even one lynching, and the only way to suppress lynching is to let those who engage in it understand that they will be punished and punished severely."

As to the Negro under sentence of death, the woman he was convicted of having assaulted wrote the governor a letter asking that life imprisonment be substituted for the death penalty. However, Governor McLean stated he would take no action until the prisoner's appeal had been passed on by the Supreme Court.

Sentiment for law and order in North Carolina is confined to no one section of the state. The events just outlined occurred in the state's most cosmopolitan city, located near the western border of the state. In the purely homogeneous east, nearly 400 miles from Asheville, a less recent but equally striking example of judicial courage and community sentiment against lynch law occurred at Williamston, in Martin County.

A young white man, born and reared in a northern state, was arrested on a capital charge preferred by a salesgirl. Without warning on the part of the mob, this young man, while awaiting trial, was taken from jail, hurried to a spot near the town of Williamston and mutilated.



Following this affair, Don Gilliam, the brilliant young solicitor of the district, was instrumental in rounding up more than thirty men charged with participation in it. Governor McLean ordered a special term of court for the trial of the young white man charged with the capital offense and the men who had mutilated him. The man who faced the capital charge was freed by order of the court. The mobmen were sent to prison and made to pay heavy fines.

The presiding judge in this instance was Neil A. Sinclair, of Fayetteville, a terror to mobmen. Every man that had been arrested was indicted by the grand jury on the opening day of court. Those who did not subsequently throw up their hands and plead guilty were convicted by a jury of Martin County men. The prison sentences imposed by Judge Sinclair ranged from six to thirty years in the penitentiary. Many of the defendants were required to pay $500 each to help defray the expenses of the special term of court called to try them.

In his charge to the grand jury, Judge Sinclair rebuked lawlessness in no uncertain terms. Before closing court, after the men had been sentenced, he declared that the experience of those about to begin their prison terms should serve as a warning to any who, in the future, might contemplate attaching themselves to mobs for the purpose of taking the law in their own hands.

This, also, was one of the most notable sessions of court ever held in North Carolina, within the borders of which Virginia Dare, the first native white child of North America, was born and christened.

North Carolina's experience in its war on mob rule has shown that vociferous protests, alone, no matter how sincerely they are uttered, cannot stamp out this evil.

Gilbert K. Chesterton, in *G. K's Weekly*, pays his respects to Lloyd George and his erstwhile friends in this wise:

Of course, the best joke in the comedy of *Much Ado About Mond* is the fact that Mr. Lloyd George, of all men, was moved by anger to anti-Semitism. What he said was really rather witty; the sort of thing that is usually said by public men in private life. He said that Mond, like another famous Jew, had gone to his own place. But when we remember how Mr. George's party and public following once howled aloud with horror at us for calling a Jew a Jew, we are naturally amused to hear him calling a Jew a Judas. Poor Mond may or may not be like another member of his race, but there were a good many other members of his race against whom Mr. George showed no such Jew-baiting ferocity. There was Marconi Isaacs, for instance; did he go to his own place; and was that place of punishment the palace of the Viceroy of India? There was Marconi Samuel; did he also go to his own place; and was it his appointed penalty to help the Jews to bully the Arabs? Anyhow, it is amusing for those who discussed these things twenty years ago to see them turning up again when they happen to serve somebody's turn. And Mr. George, having been everything else, may as well be an anti-Semite too before he dies. For the rest, these quarrels in the lobby do good on the whole. In the simple words of the homely old English proverb, when professional politicians fall out, ordinary citizens may occasionally come by their own.

ɛ ɛ ɛ

the University of Michigan is going to send a unique scientific mission to Greenland this summer to obtain information about the ice, mountain and marine features of that island. The outstanding feature of the project is that Peter Freuchen, former Danish governor of the Thule Eskimo settlement in Northern Greenland, and Fred W. Bartlett, a graduate of the Michigan geological department, have volunteered to remain behind and pass the balance of the year in a tiny, snow-buried hut 100 miles eastward from the coast, in order to record weather conditions. This hut will be in a desert waste of snow and ice 7,000 feet above sea level. A temperature of 30 below zero prevails in midsummer, and kerosene becomes like lard in the extreme cold of midwinter. It is in the Greenland area that the boreal blasts which sweep down upon the northern hemisphere are bred. It requires from three to five days for one of these blizzard-like storms to cross the ocean to Europe. The observers are to determine whether it would be feasible to have a permanent observatory there to give Europe wireless warnings of storms. All of the benefits of such a weather service would accrue to Europe as American blizzards originate either in or beyond Alaska.

ɛ ɛ ɛ

Judge John M. Killitts, of the United States district court for Northern Ohio, continues to make the path of the fake stock transgressor hard. Josiah Kirby, dapper, persuasive Cleveland promoter, obtained forty million dollars through the sale of so-called securities before the crash came. Although he was tried in several courts, Kirby seemed to bear a charmed life until he came before Judge Killitts. A mistrial occurred the first time. Instead of postponing the retrial indefinitely Judge Killitts insisted that it be conducted at once. Kirby was promptly convicted and sent to join Dr. Frederick A. Cook, who was also tried before Judge Killitts.

ɛ ɛ ɛ

new American loans to European governments are pending. In this connection it might be well to recall that private loans to governments have frequently remained unpaid. England loaned large sums to Portugal during the Napoleonic Wars, but although England still carries the debt on its books Portugal has never moved to repay the advance. England herself failed to pay to bondholders the loans that covered the saddles Wellington purchased during his campaigns. And Italy has just recalled that the loans which Henry VIII of England contracted with Florentine bankers have never been repaid. The Fuggers; international bankers of the Middle Ages, lost their leadership because their kingly clients contracted more easily the habit of failing to pay than they contracted the loans.

Present-day foreign government loans might be said to date from the bonds that the late Austrian Government sold to the Rothschilds. But Austria never repaid any of these loans in their entirety. Sometimes a bond issue would be paid by selling even more new bonds, the surplus being duly wasted. The purchasers of Mexican, Turkish, Egyptian, Persian, Chinese and Central and South American government bonds have had more or less unhappy experiences. The fact is that the average government loan represents the desire of politicians and misled citizens to live beyond their income, and there seldom or never comes a time when people are willing to tax themselves sufficiently to pay off such foreign debts.

Fred E. Smith, truck driver, addressed members of the New York Junior Board of Trade and Transportation: "If you want to learn something about traffic in New York," he said, "go out and drive a truck." Mr. Smith, attired in a sheepskin coat and sweater, attended the conference at his own request. He was obviously fidgety while lengthy and highly technical discourses were given by traffic experts. The maps and diagrams on the walls meant little or nothing to him. But when it came his turn to speak, he had something to say. "Go out and drive a truck," he shouted, and his audience applauded. In his own way Smith had voiced the old doctrine about high-flown theories being worthless unless based on actual experience. And the theorists realized its truth.

# The Business End of Mormonism

## Latter-Day Saints, Having Passed Through the Wilderness of Pioneer Days, Are Now in the Promised Land of Prosperity

By GEORGE FREDERIC STRATTON

ONE of the most costly and finely finished office buildings in this country was recently completed in Salt Lake City. Its cost was very nearly one million dollars without the ground, and the entire building is used exclusively for the varied administration affairs of the Mormon church.

President Heber J. Grant.

No one can stroll through that building without feeling that it was built for business—big business; and in talking with the heads of the various departments, the wonder grows amazingly of an organization, despised and belittled because little known, carrying on and increasing in marvelous variety, industrial and financial operations planned by its leaders.

The inscription on the marble slab over the entrance to the building, "L. D. S. Church Offices," gives no indication of the duality of the church business—a business which combines the activities of its religious mission with the administration of its earnings from the very large and varied industrial and financial operations in which it is engaged.

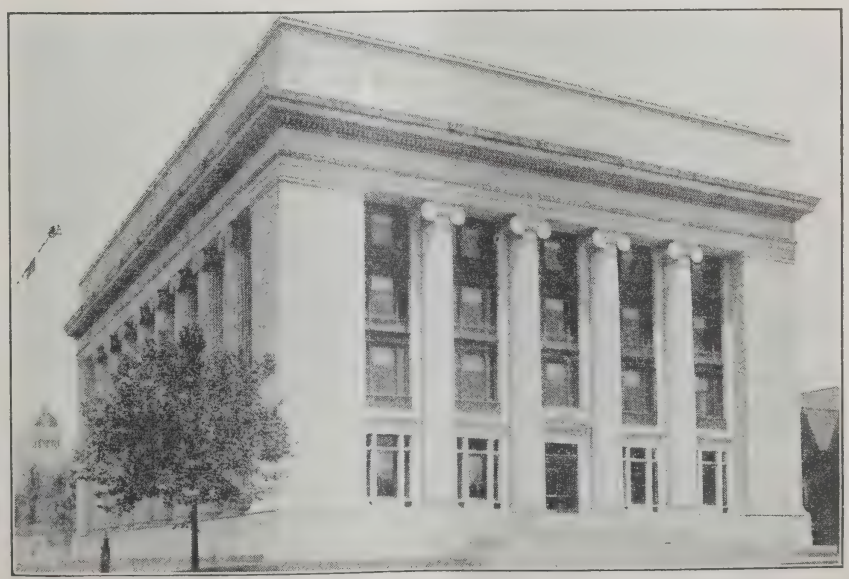
In the early days, the beginning of industrial development, if a Mormon way out on the desert or up in the mountains or in a well-developed region had an ambition for some improvement of land or business—if he wanted to build a gristmill or creamery, a blacksmith shop or an irrigation dam, he usually went first to the bishop of his ward—a man who had probably been his school chum and his neighbor for years. If the proposed enterprise looked thoroughly businesslike and was too large for local accomplishment, that bishop had only to communicate with headquarters at Salt Lake and the matter would be investigated. If it were a sound, promising proposition, it would receive encouragement and financial aid on a purely business basis. The policy of the church was to aid, leaving details and management to local officers.

The gross amount of such business, tabulated and administered in that great office building, including its historical, general recording and genealogical work, is enormous. Large as are the figures in the president's report, which is mentioned later, and which relate only to purely church affairs, the industries in which the church is financially interested, enormously increase those figures.

President Heber J. Grant is the president or director of no less than ten incorporated banks, railroads, manufacturing and land companies in which the church has large holdings. He is chief over more than nine hundred churches, six magnificent temples, three of the largest colleges, several great hospitals; of the entire organization of the church day schools and of the church Sunday schools and other auxiliary associations and of all the foreign missions.

Many of the largest manufacturing and mercantile establishments of Utah and the neighboring states are controlled by the coöperation of Mormon capital with other investors. Among them is Zion's Coöperative Mercantile Institution, with a six-million-dollar department store and wholesale warehouse in Salt Lake City; the great Utah-Idaho Sugar Company, capitalized at twenty million dollars with sixteen factories in Utah, Idaho, and Montana, each of which cost from half a million to a million and a quarter dollars.

The church owns a large interest in the greatest pleasure resort between the Missouri River and the Pacific Coast—Saltair on the Lake, which was partly burned last summer and is now being rebuilt at a cost of $350,000; in the largest theater for legitimate drama in the city; one of the brightest edited daily newspapers; in the most beautiful and commodious hotel and the splendid public museum. Mormon capital controls three of the most solid banks and an equally solid insurance company; a large book publishing house and a finely stocked bookstore.



These are all Salt Lake City institutions. All over the intermountain region, wherever there are Mormons, there are found smaller exploitations and industries in joint stock companies many of which owe their success to the financial aid and advice of the church leaders.

To understand the system and efficiency with which the secular affairs of the church are managed, it is necessary to consider the organization.

The president is the head; the source of last appeal in any matter of doubt or dispute, and he has two counselors—Charles W. Penrose and Charles W. Nibley, both old, experienced, well-tried men.

There is a quorum known as the Twelve Apostles, which is the next chief advisory body on both sacred and secular affairs. Next come the "Patriarchs" whose work appears to be solely with the spiritual side of Mormonism. Then there is the presiding Council of Seventy. There are more than one hundred quorums of seventy located wherever Mormons are settled. From them the missionaries are chiefly drawn. There is also the Presiding Bishopric whose functions are chiefly devoted to temporalities and who has a large, fine separate office building.

With the exception of the Patriarchs, there is scarcely a man among all those officials who is not, more or less, actively engaged in personal business. For instance, Bishop Charles W. Nibley, one of the president's closest advisers, has been very active in the conducting of the great Utah-Idaho Sugar Company, the twenty-million-dollar corporation, and in other business.

Million-dollar office building of the Latter-Day Saints.

The church buildings, including power plant which supplies heat, light and power for business buildings as well as the church buildings.

President Grant's private office. With the exception of hardware and glass, the beautiful building is entirely of Utah material.

Hotel Utah. Capitol building in the distance.

Business atmosphere surrounds every man who holds a church office, even down to the bishop of the smallest country congregation. Let me give the occupations of some I have known. Several are farmers; one is the proprietor of a large general store; one is a blacksmith; another the owner of six thousand range sheep; another the cashier of a bank; another the owner of a mountain sawmill; another the manager of a mountain stage line. Many of them are prosperous and very active men, yet every one of them is ready at a moment's notice to drop his plow handles or his account books to answer any call of sickness or distress or other local duty of his calling.

All the high executives and general church officials have private offices in the great office building with beautiful meeting rooms for their committees and anterooms for their clerks and stenographers. There is a large general office with the accountant and his clerks; a treasurer, a mission secretary, and a transportation manager.

We gain an impressive view of the large activities when we learn that the duties of that transportation man are entirely absorbed in routing officials and members to distant parts of the country and abroad; in arranging and purchasing transportation by rail, steamer or pack outfits for missionaries to all parts of the world and in securing special rates from the railroads to bring in the great numbers of country church members to attend the semiannual conferences, the state fairs or special concerts and recitals at the great tabernacle.

Some day, when men care to segregate a man's religious life or creed from his business methods and activities, which is commonly done in short biographies of big men, the splendid achievements, the jovial activity, and the magnificent breadth of view of things material, will place President Grant in his well-deserved rank among the captains of industry. Sixty-seven years of age, he may be seen constantly motoring or railroading—perhaps out on the Great Salt Lake Desert and the Skull Valley for a social talk with his church members; or south into Utah's Dixie to preside at the dedication of a new meetinghouse; or still farther south into Mexico to talk and encourage the great Mormon colony there, or north to Alberta, or sailing west to Hawaii for similar purpose.

When he is at home—resting, he calls it—he attends directors' meetings or visits the local wards, giving his "brothers" clear, incisive, practical talks on how clean, straight business affects life here, making that to his hard-working and level-headed hearers the basis of his sometimes very eloquent remarks on the hereafter.

Andrew Carnegie frequently said, and apparently took pride in saying: "It is not the work I have done which has placed me where I am, but the selection of the best men obtainable to do the work."

It takes a good man to select good men and perhaps the experience of the steel magnate was that of the Mormon magnate and his lieutenants. Business men in the intermountain region and others who come from the great business centers of the East to look into business opportunities and natural resources, pay close attention to a Mormon's descriptions, especially if Mormon capital is in the development.

It has been said rather commonly that in Utah no one but a Mormon can get a position in any of the big Mormon exploitations. This is erroneous. I have lived in Utah for a dozen years, have been in close contact with the biggest and the smallest business men in all parts of the state, but I know of only one case in which the employer, a small manufacturer, had any rule of that kind. And he was, some time back, excommunicated from the church for nonconformance with its doctrines and rules.

Mormons are like Freemasons or Odd Fellows or Catholics in that respect. Other things being equal, the preference is given to the brother of the order or of the religion. If there are two candidates for a position without any choice as to their abilities, the member of the brotherhood—whatever it may be—gets the job. But if that member is inferior to the other man in any way, the other man gets the job.

Brigham Young, from the start of his colony, was strongly opposed to any prospecting for minerals. The doctrines of his church are largely based on those of the Old Testament days when tilling soil and herding cattle engaged all of man's activities. He urged emphatically that gold was useless among them except as an indication of wealth and such indication would be far more strongly indicated and emphasized by tilled lands, orchards, and farm homes.

That the far-seeing gentleman was wise in that is curiously demonstrated by Nevada today. The most sparsely settled state in the Union, it has a property wealth far greater than any other of the five intermountain states. But indications of such wealth are very, very scarce. Less than two per cent of all its great area is farmed, although there are cattle and sheep running on the ranges. You may drive across, north to south, east to west, and see little improvement since the days when Indians and coyotes were the only living things.

The Mormon leaders also felt that mining would surely bring in a very undesirable people and greatly disturb the steadiness and industry of their settlers.

But the stampede of '49 put the lure of gold into all men and prospecting commenced. Gold was found by some Mormon hunters in the nearby Oquirrh Mountains even before the great discovery at Sutter's mill in California. The recovery at first, without any equipment but cradles and dishpans, was very small, but some years later outsiders came in, built stamp mills and a smelter and presently Mercur was one of the roaring mining camps with millions of dollars' worth of value taken out.

Most of the great mines of Utah have been so discovered and developed by Mormons. The famous Bullion Beck Mine of Eureka was capitalized and developed by Senator Reed Smoot associated with several of the officials of the Mormon church.

# Consolidated Stock Exchange—Finis?

(*Concluded from page 6*)

the Consolidated will become members, too, for there is nothing to bar them if their business ethics have been unstained.

Very strained relations existed for a time between the two exchanges, until recent times, when the Consolidated was virtually ignored. The Hughes Commission of 1909, after an exhaustive report which now in most instances would be out of date, said that tension between them was increased by the method by which the Consolidated obtains the quotations of the other, through the use of the tickers conveying them.

"It is probable that without the use of these instruments," the report added, "the business of the Consolidated Exchange would be paralyzed, yet the right to use them rests solely upon a technical point in a judicial decision which enjoins their removal." Ten years ago the Stock Exchange tried again to remove them, but the injunction protected the Consolidated. That led to the belief and frequent assertion that the latter was a parasite of the larger institution, since it could not function without the tickers.

***Some Facts About Membership***

Persons familiar with the financial fabric of the metropolis believe that this injunction marked the doom of the Consolidated—the more or less nebulous boycott which has crystallized into dissolution proceedings.

The Hughes report also said this of the Consolidated:

"It is nevertheless a secondary market of no mean proportions. By far the greater part of the trading is in securities listed on the main exchange, and the prices are based on quotations made there. The fact that its members make a specialty of broken lots is used as ground for the claim that it is a serviceable institution for investors of relatively small means. But it is obvious that its utility as a provider of capital for enterprises is exceedingly limited, and that it affords facilities for the most injurious form of speculation—that which attracts persons of small means. It also permits dealing in shares not listed in the main exchange, and in certain mining shares, generally excluded from the other."

Parenthetically, for several years these mining stocks were dropped, but a few months ago steps were taking to reinstate them.

The actual value of membership has always been a conundrum. Seats sold for $2,000. They also went begging for a few hundred dollars. President Silkworth, in an article written in 1921, said that at that time membership in the Consolidated Stock Exchange possessed "greater value and promise than ever before in its history." That prediction not only has not come true, but the opposite has been the case.

Originally the New York Mining Exchange, by 1885 it had absorbed the National Petroleum Exchange, the Miscellaneous Securities Board, the American Mining and Stock Exchange and the New York Petroleum Exchange and Stock Board. In that year its membership was 2,403. By 1916 it had declined to 671 firms, with further declines until, in 1922, 410 members were listed, of which only 22, it was said, actually transacted business, and of these only three firms had been established prior to 1900.

It was unfortunate for the Consolidated Stock Exchange, of course, that Mr. Silkworth was tried in October, 1924, for alleged fraudulent use of the mails in connection with bucketing charges, and was found guilty, with five codefendants, the following December. At that trial D. C. Raynor, a defendant, attempted to strike Mr. Silkworth.

Another trial was that of Charles A. Stoneham, which culminated with his exoneration, but the publicity attending the case was not a recommendation. Other more or less conspicuous trials took place. Then there were the score of failures which served to shake confidence until little of it remained.

The great question now is whether a new Consolidated Stock Exchange will be organized. With the passing of Thomas B. Maloney, whose resignation became effective February 15, who proved himself a poor leader and whose attitude was regarded with dubiousness by both the attorney-general and a dissenting group of members, its fate rests between the two. New officers have been elected, an inevitable action in view of the resignation of the former officials, but just what this will presage it is difficult to say. In financial circles, however, it is doubted whether any effective reorganization or reëstablishment will take place.

So far as state officials are concerned, they will not interpose objections if reorganization is contemplated, but the injunction grip probably will not be loosened for the present, and the state will not forego its technical advantage of checking up on whatever reorganization plans are taken. But it is unlikely that the new institution will have the benefit of the New York Stock Exchange tickers. And, as of today, the whole organization seems to have reduced itself to a real estate holding company, since the Consolidated's home is on a valuable corner, and its sale, if this should follow, ought to produce somewhere near $2,000,000, at current values.

***Martin Law Slated for Attack***

Meanwhile, the constitutionality of the Martin law seems to be slated for attack. At the time of writing the state was ready to defend it. The attack was indicated in connection with the defense of George Graham Rice, also known as Jacob Simon Herzig, who was indicted early last January under the Martin provisions. If that happens, the Rice case will be a mere incident compared with the contest attaching to that law's validity. A blue-sky law had been sought for many years, and while the statute is considered still imperfect or inadequate, it has been the means of bringing to justice many schemers whose results in detaching a gullible public from its money have been astounding. Every banker and business man will be aroused by the possibility of an adverse decision.

***Business Men Want a Foolproof Law***

The opinion supporting unconstitutionality, according to the New York *Times*, was written by Louis Marshall, who holds that the Martin Act makes of the attorney-general of New York the actor as well as the judge, with unfettered discretion—a procedure which "partakes of every element of the infamous third degree."

So far as I have been able to learn, no objection is entertained against the review of the general business law for its constitutionality or unconstitutionality. But business men want to be sure that a foolproof law will be available as soon as the other is found faulty, should this prove to be the case. New York City, with a fairly bullish market and plenty of money pouring in from investors and speculators, would be unthinkable without a blue-sky law of some kind.

And a victory by those who would have everything to gain by such a verdict would be a greater calamity than the passing of Consolidated Stock Exchange, in the opinion of many I have interviewed.

# "Commence, Don't Begin"

THE editor of a magazine was asked recently to give some advice to a young writer who had been brought to his attention by a friend. He thought a moment and then said tersely:

"Tell him: Don't begin, just commence."

There is a world of wisdom in that short remark.

A writer often begins his tale with an explanation, perhaps, of the theme, the people, the place in which the plot is laid or, as is often the case, he may moralize for a thousand or more words. Then when the reader is about ready to drop the magazine uninterested, the author really commences his story. "Get them in the first paragraph if you want to hold their attention" is applicable both in literature and in life.

Many a man has lost out because he only *began*, and did not *commence*. Perhaps he is a salesman who, when he enters the office of a prospective customer, tries to ingratiate himself into the other's favor before coming to the point. He speaks of the weather, talks of business conditions in general, and the outlook for the coming season. When at last he has made his beginning, and is ready to commence his sales argument, it falls flat. Another commences who when he enters an office says: "I am here to tell you of the new issue of municipal water bonds. They pay 7½ per cent interest. As the city is behind them they are as good as gold. Just sign on this dotted—" Notice the difference?

The preacher, the lecturer, the public speaker of any kind, often bores his audience and gets it out of sympathy with him, just because he *begins* with a long introduction, taking perhaps twenty minutes before he *commences* what he has to say.

One of George Eliot's stories starts thus:

"Things never *began* with Mr. Borthrop Trumbull, they always *commenced*."

# Most Ancient Musical Instruments on Record

By ANNETTE BARRETT DEWEY

THE most comprehensive records of early music and musical instruments are found in Chaldea and Egypt. Scientists have concluded that the cradle of the human race is situated in the high plateau of Asia. Whether this be true or false, it is a fact that some interesting records of ancient music have come from cities in Western Asia Minor. But the oldest records come from China.

There were many writers of dance and ancient music, on playing the Kin and Che, and on construction of the scales, in China in 2277 B. C. The Chinese philosopher, Confucius, wrote of ancient music in 551 B. C.

Students of investigation have found that the Chinese were much advanced in the science of music at the time the Pharaohs were building the Pyramids.

A peculiar characteristic of Chinese musicians is that they like to institute the likeness between heaven and earth, and intellectual and material things. They use eight sound-giving bodies—stone, metal, silk, bamboo, wood, skin, gourd, and clay.

The Sheng, used in their temple ritual, is one of their most important instruments. It is of the gourd principle, and its base was originally formed from the gourd or calabash. A circular piece of wood with holes around its margin in which seventeen pipes are fitted is placed at the top of the base. Each pipe has a small free reed of copper fitted inside, and a small hole just above the bowl to prevent them from speaking when air is drawn in by the player, unless the hole is closed by a finger. To play the instrument, it is placed to the mouth with the pipes slanted toward the right shoulder.

The sound of silk is exemplified in the Kin, or Ch'in. Its strings, which are stretched over a wooden frame, are made of twisted silk. The Kin was the favorite instrument of Confucius. In his day, it was made with five strings, to agree with the five elements, and the upper part was round, to represent the heavens, while the bottom was flat, to represent the ground. Later, the number of its strings was increased to seven, which could be tuned to the pentatonic scale.

Other Chinese instruments are the Se, or Che, and Flutes. The Se is a stringed instrument. Some have twenty-five strings, while others used by the best musicians have only thirteen or fourteen strings. To play them, two small ivory picks are used.

The Flutes are made of bamboo. Some are fixed to be blown at the end like a whistle, others are arranged like our own modern flute. They are varied in size, and have from three to six holes. The Ti-Tzu, the most popular flute, has, besides the six finger holes, one to blow and one that is covered with a thin membrane to produce different sounds. The most ancient and peculiar flute is the Tche, which was in use 2205-1122 B. C. It has three holes on each end and one in the middle. It is played by blowing across the middle hole.

In Japan, the Hichi-riki, Sho—an instrument much like the Chinese Sheng—and the Koto are recorded among the ancients.

The Hichi-riki, on the clarinet order, is about nine inches long, and is played by drawing in the breath. The Koto is the Japanese national instrument. It has thirteen strings, and can be tuned to produce a scale like that of the aeolian.

Hindus belonging to the Aryan race, and originating in Central Asia, were great lovers of music, both vocal and instrumental. They held minstrels in the royal courts, and all religious services were conducted with music. Their instruments were trombones, flutes, and strings.

The most important, also the most ancient Hindu instruments, are the Vina and Ravanastron. The Vina is made of a pipe that is four feet in length, and is attached to two gourds, called resonators. It has seven metal strings stretched over nineteen graduating frets and touching only the last and highest one. It is constructed and played on the same order of the present guitar and mandolin.

The Ravanastron, considered the original stringed instrument, played with a bow, resembles a violin.

It is thought that the Hungarian gypsies got their music from the Hindus.

Following the above-mentioned instruments, as civilization developed, came harps and flutes of many types, horns, the bass viol, the organ perfected in 742, the clavichord, the harpsichord, and, finally, the piano, which was first invented by Bartolomeo Christofori, of Tuscany, perfected by Gottfried Silbermann, of Saxony, in 1737, and approved by the renowned composer, Johann Sebastian Bach.

# A Dance A Week

## SICILIAN CIRCLE

Any number of couples may take part in this dance, and continue as long as desired.

It is usually performed in a circle formation, although it may be danced in a straight line in sets of two couples. The couples in each set face each other, their backs being toward the couple in the next set. Dancers and music begin together.

All forward and back..... 4 bars

Gentleman joins partner's nearest hand, and walks forward and backward.

Circle four hands around.... 4 bars

Both couples join hands in circle and move to the left.

Ladies chain..... 8 bars

Right and left..... 8 bars

*All stand and balance..... 4 bars

Face own partner and each execute a balanced step.

(Step forward on left foot, and swing the right in front, step on right foot, swing the left foot in front.)

*Promenade once and a half around..... 4 bars

Cross hands with partner, and promenade once and a half around and finish facing the next new couple. Repeat from the beginning.

To end the dance call,—"Join hands forward and back, turn partners, promenade to seats."

*NOTE—In some localities, the last two calls are omitted, and the following substituted:

Forward and back..... 4 bars

Forward again and pass through..... 4 bars

In passing through couples drop hands and pass on to meet a new couple. The entire dance is then repeated.

### SCOTCH REEL

Form as for Sicilian Circle, couples facing up and down the hall. Call first change before the music begins.

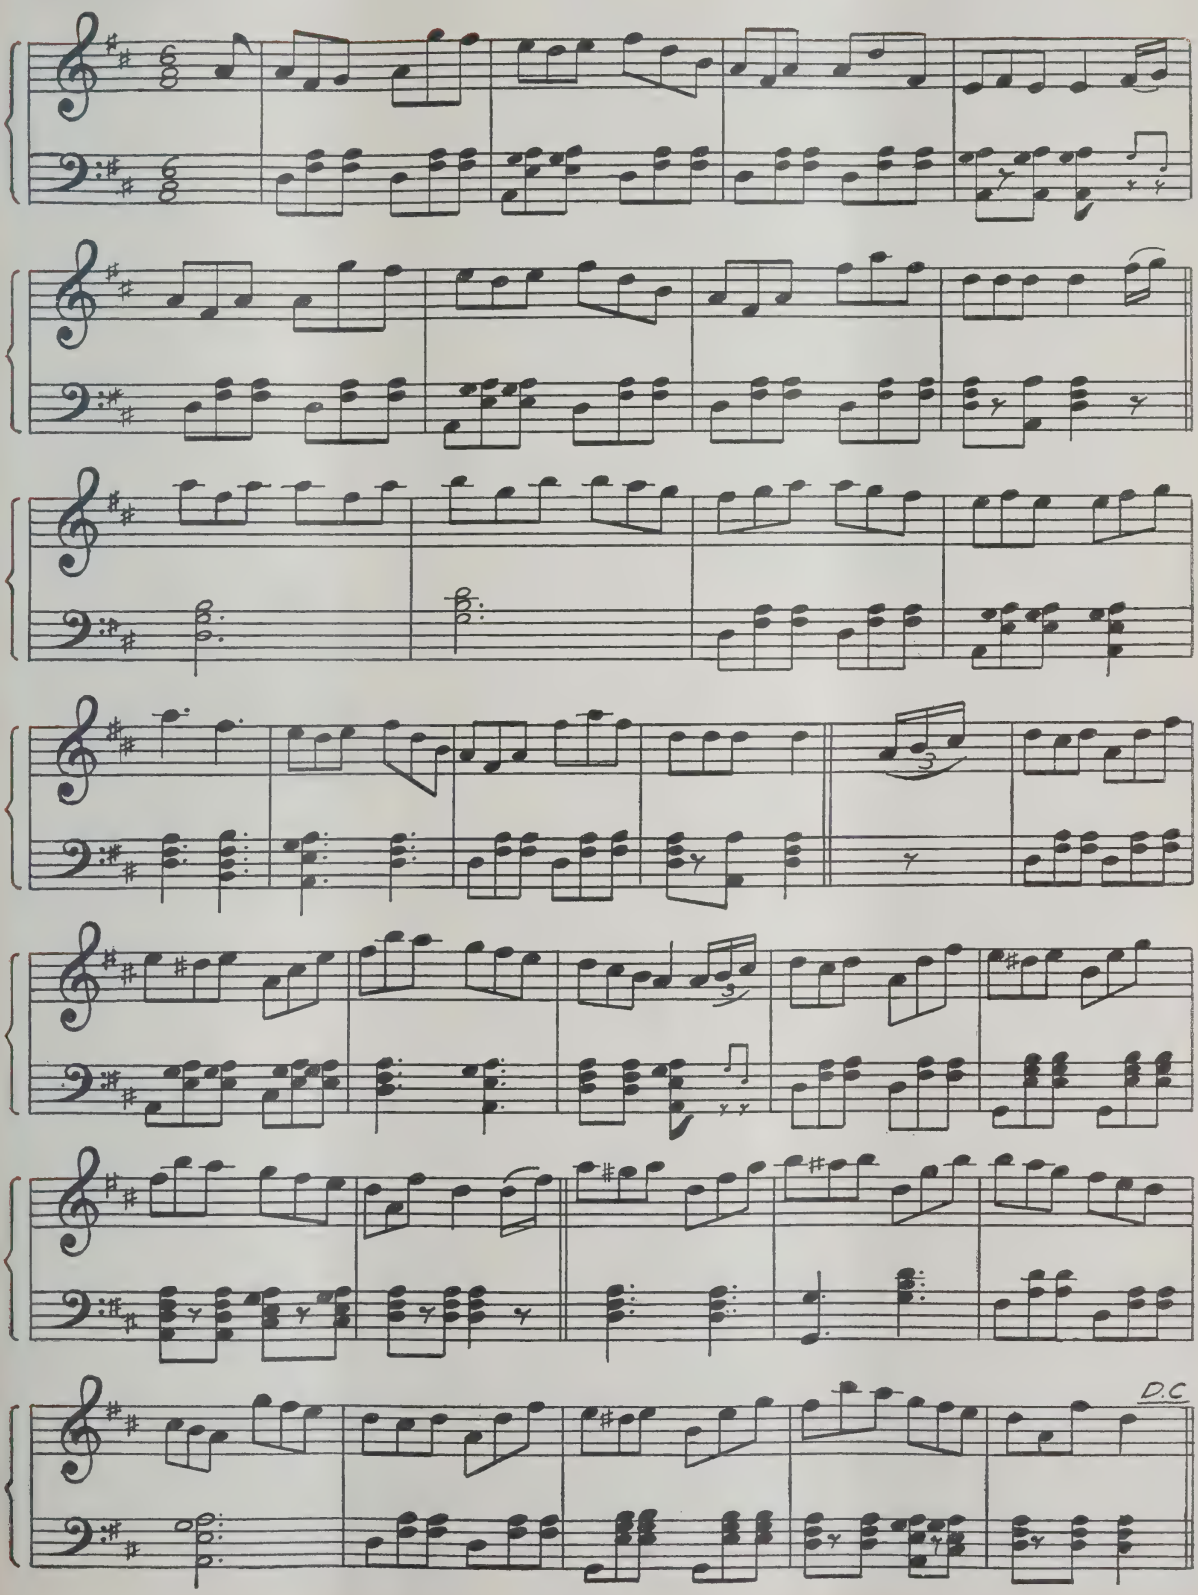
Swing opposite with the right hand..... 4 bars

Swing own partner with left hand..... 4 bars

Balance four..... 8 bars

Ladies chain..... 8 bars

Right and left..... 8 bars



Forward and back..... 4 bars

Forward and pass through..... 4 bars

Repeat as long as desired. To close dance call,—All join hands, forward, turn partners, promenade to seats.

Metronome 116

# Adventures in Plant Hunting

## Combing the Earth for New and Rare Specimens of Nature's Floral Gems

By E. I. FARRINGTON

A LARGE proportion of the flowering plants which adorn our gardens have come from foreign shores. Most of them have been introduced within the last half-century. Many of them have been obtained at the risk of life and limb. Some are associated with adventures and experiences as thrilling as those described in the most imaginative novels.

Plant hunting has always gone along with the exploration and development of new countries. Missionaries and pioneers have often been botanists as well. Sea captains have carried hundreds of new plants from distant shores to their native lands and many of these plants have thrived in their new environments. Introductions made in this way, however, have been spasmodic and casual. It has remained for trained men with scientific minds and wide botanical knowledge, as well as unlimited resourcefulness and unquestioned courage, to make the search for new and rare plants a systematic undertaking.

Korean balsam fir—a new conifer of great value to American gardens.

It is an interesting fact but a natural occurrence that one or two of the most venturesome of the early plant hunters turned to America in their search for plants. They were Englishmen and the New World was thought to contain unknown plant material which might be worthy of a place in gardens. David Douglas was one of these early plant scouts and one of the most successful. The number of conifers he sent back to England was astonishing. At least half a dozen species of American pines are now to be found in many parts of Europe, all grown from seeds sent back by Douglas. Many plants of other kinds were found available for English gardens, a total of 217 species, according to the records. It is not surprising, therefore, that American travelers find English gardens filled with American plants, some of them being grown more commonly, indeed, than in the gardens of the United States. Later Douglas went to the Sandwich Islands, where he was killed by falling into a deep hole made by the natives for trapping wild cattle.

The best known of the last centuries' plant hunters was Robert Fortune, who died in 1880. He, too, was an Englishman. The fact had become known that China was filled with plant material of the most alluring nature. Fortune found and sent home such plants as forsythias, barberries, daphnes, bleeding hearts, anemones, wistarias, azaleas and chrysanthemums, some of which are now among our commonest garden plants. Once he disguised himself as a Chinese, to secure a double yellow rose which he had seen on a wall in a mandarin's garden.

Fortune won the gratitude of all horticulturists, yet he hardly nibbled at the store of plant treasure which China held. Others were to follow in his train, but, in the meantime, other parts of the world were being botanized. Thomas Lobb found hundreds of new orchids in the Philippines, in Burma and in India. Richard Cunningham chose Australia for his field of research but the natives caused his tragic death.

South America proved a treasure house of orchids and of water lilies. Among the latter, *Victoria regia* created a sensation because of its immense size. Poinsettias and Bougainvilleas were found on the southern continent. Mexico produced the dahlia, which was first introduced by way of Spain, then lost and reintroduced some years later. Japan proved a fruitful source of new plant material as soon as it was opened up to foreigners. Fortune went there on his second trip to the Far East and was greatly interested in the chrysanthemums which he found in every garden. Several species were sent to England and from them have come the enormous shaggy flowers seen in the flower shops of this country at the present time. This same plant hunter had already introduced from China the small-flowered or pompon chrysanthemum, so that the name of Fortune is very closely connected with the history of the chrysanthemum in the western world. In the eastern world this history runs back to far distant ages. The chrysanthemum must have grown for 2,500 years, for in his work, the *Li-Ki* (ninth moon), Confucius remarks that "The chrysanthemum has its yellow glow."

The early plant hunters soon established pleasant relations with Japanese plant growers, with the result that American as well as European gardens are filled with Japanese material. Many of the finest outdoor lilies come from the Island Kingdom and when the so-called Easter lily bulbs of Bermuda began several years ago to deteriorate and prove unsatisfactory for forcing, a Japanese lily of similar character was discovered and is now imported in immense numbers.

Professor C. S. Sargent, of the Arnold Arboretum, visited Japan many years ago and discovered several splendid shrubs and trees which are now flourishing in this country, *Azalea Kaempferi* and some of the ornamental cherries being among them.

Japan has been a fertile field but China has supplied the greatest number of new plants. Many of them have come to this side of the globe through the intrepidity of Dr. Augustine Henry, who went to China as a medical officer in 1881. On a trip which carried him a thousand miles up the Yangtze he began to find new flowers and shrubs which looked as though they might be suited to cultivation. Soon he became engaged in a series of plant explorations which lasted over a period of 20 years and in the course of which he sent the almost incredible number of 158,000 dried specimens to the Kew Gardens. He discovered what he called the Dove tree and which he described in such glowing terms in letters home that a great firm of seedsmen in London determined to send out a special mission to obtain seeds of this tree. It had appeared from Dr. Henry's reports that the tree was very scarce and was to be found only in a very remote part of China. He himself had seen only one specimen but had found it lovely beyond comparison. The man who was chosen to travel thousands of miles into an unknown country and to live for months among more or less hostile people was Ernest H. Wilson, who was thus launched upon a career which has made him the most famous of living plant hunters and has placed him high among the plant hunters of all times. Mr. Wilson, who is now assistant director of the Arnold Arboretum in Boston, has spent 20 years in China, Japan, and Korea. Two years ago he returned from a journey to South Africa, Australia, and India which lasted two years and during which he covered 100,000 miles. In all, he has traveled at least a million miles in his search for plant material which heretofore has been unknown in American and European gardens.

All this traveling, most of which has been done in sparsely settled regions where privation, danger, and toil were daily accompaniments, has resulted in the introduction of at least 2,000 trees, shrubs, and

The wonderful Regal lily, discovered by Mr. Wilson in Western China.

perennial plants never before seen outside the Orient. Many of these introductions have proved remarkably well adapted to European and American conditions.

The journey in search of the Dove tree was the beginning of a series of plant-hunting expeditions which upset all the calculations and predetermined ideas of horticulturists.

The young man had not spent many days in his search before he became convinced that this might be the case. Then, when he was going forward with considerable enthusiasm, he suddenly discovered eleven Dove trees, the existence of which had never been reported, and they were at the height of their blooming season. Then and there Mr. Wilson set down his belief that there was not another tree in the north temperate zone more beautiful. He spent weeks in close association with these trees, waiting for the flowers to fall and the fruit to form. Nature was kind to him. The production of seeds was enormous. They were sent back to England posthaste and planted. In time thousands of seedlings were pushing their way through the ground. He himself and an assistant potted up fifteen hundred. Later, through mischance, many were destroyed, but others were planted out and grew thriftily. In recent years they have flowered and have amazed crowds of people by their beauty.

An Asiatic redwood.

It was Mr. Wilson who discovered the Regal lily when climbing through the mountainous districts of Szechwan. Thousands of them clothed the plateau at his feet. Of course, he coveted them for American gardens. He instructed his coolies to carry his sedan chair down a winding road hardly more than five feet wide, but some instinct caused him to glance up the mountain side just in time to see a great mass of rock and earth swiftly sliding down. He leaped from his chair and as he did so a great rock sent it careening into the valley below. Another rock struck the plant hunter and broke his leg. His coolies fled up and down the path in which he lay outstretched. Then, to make matters worse, a mule train came marching down the defile. As it happened, the landslide had actually jumped the road, with the exception of the rock which had struck the traveler. Before an escape could be made, the mules, each with a heavy burden lashed to its back, passed over his body. He counted them as they moved slowly along, one by one. There were forty in all, but not a hoof touched the prostrate man, although, as Mr. Wilson now says, each foot looked as big as a dinner plate while it hovered above his head.

Presently the coolies returned and the injured man was carried to a Chinese city three days' journey away, where he lay for twelve weeks before he could walk even on crutches. It is not surprising that a slight limp still remains as a reminder of his adventure.

The point of the whole story is, however, that as soon as Mr. Wilson was able to travel again he went back to the mountain and collected hundreds of lily bulbs which were brought to America where they have thrived as well as in their native Chinese soil. Now the Regal lily is to be found in gardens all over this country and has proved itself one of the most beautiful of all Chinese introductions.

The introduction of the Dove tree and the discovery of the Regal lily would probably have been enough to win for Mr. Wilson the Victorian Medal of Horticulture, which was awarded him some years ago, and which he alone of all horticulturists in America has received. These two achievements helped to win him fame, as well as the name of "Chinese Wilson."

One trip to the Far East carried him to the Island of Formosa, where he made the discovery of a wonderful tall evergreen called the Taiwania, which is a close relative of California's big tree, the giant sequoia. Very few of these trees are in existence but a number have been propagated and are now growing in the warmer parts of this country.

The journey through Formosa was fraught with adventures. As is well known, this island was until recently inhabited almost wholly by ferocious tribes of men whose chief end and aim in life was to acquire as large a collection of heads as possible with which to decorate their huts. Now the island is policed by Japanese and a reasonable degree of safety insured to travelers.

Mr. Wilson had a bodyguard of ex-head-hunters or potential head-hunters, who accompanied him with great reluctance along a wild trail to points never before reached by a white man. Only one method was discovered by which the men could be kept traveling day after day. When they loitered and refused to go any farther, they were allowed to fire the traveler's gun. They never succeeded in hitting anything, but the mere act of pulling the trigger seemed to give them keen delight, and by the promise of allowing the performance to be repeated a certain number of hours later, the little company was kept moving.

Several enterprising plant hunters representing the Department of Agriculture at Washington have been the means of introducing valuable flowers, fruits, and vegetables into American gardens. One of these men, unfortunately, has lost his life in recent years. Frank N. Meyer was a true plantsman. For nine years he wandered on foot along the pathways of China, seeking plants which would grow in America. His travels carried him into the more remote parts of the Far East. He collected wild alfalfa in the Caucasus and Siberia, Chinese pears from Manchuria, almonds and peaches from the Kansu Province, chestnuts near Pekin, persimmons in the Ming Tombs valley, citrus fruit on the Yangtze, jujubes in Shantung, cherries and apricots in Russian Turkestan.

It has been stated that Meyer traveled more miles on foot than any other plant explorer who ever lived. His days were filled with excitement.

One night he disappeared from a river steamer, on which he was traveling, and his body was found several days later.

A 60-foot pear tree, found by Mr. Wilson in Korea.

Wilson Popenoe has done much of his plant hunting in South America and penetrated sections of the southern continent which have seldom been traversed by a white man, except those hunting for orchids. Mr. Popenoe has given his attention largely to fruits and vegetables, and has introduced many new kinds.

Professor N. E. Hansen, who is in charge of the experiment station of South Dakota, has introduced plants which will stand the rigorous climate of the north country. Siberia has yielded the greater number. Through Professor Hansen's wanderings the northern range of states now has a long list of fruits, flowers, and ornamental shrubs which will go through the hardest winter without loss.

"I like to boost a good book when I find one," said ***The Man from the Next Room.*** "Have you ever read *The Confessions of a Reformer?* It is by Frederic C. Howe. I met him once. A mighty fine man, but far too good for the reforming game. To be a reformer you have got to smoke out the real rogues, and I don't think Howe ever did that. He saw the people who were playing the 'system,' and he went back of the scenes to their bosses, but he didn't go back to *their* bosses. Yet he had every opportunity to observe. I don't know of anyone who has so thoroughly, and yet so kindly, analyzed the fatal weakness in Woodrow Wilson's character. The honest reformer is a good judge, even if he is not a good prosecutor. Howe's picture of himself and other idealists going with Wilson to Paris in the glory of great messianic expectations, and the terrible disillusionment that followed, is a true and valuable report of what the good soul of the world suffered from the peace. A novelist will some day take up Howe's work and make it live before the world.

"Mr. Howe was born well, in that he was born an American of church-going stock and, as I judge, of Unitarian culture. He was one of those 'helpers' who come into the world with a passion to help overburdened, cheated and abused people. I think he is inclined to sneer at the superiority of the Anglo-Saxon, but that is no matter (it seems to be a fashion he has picked up); there is *no* superiority except that of being able to render superior service, and *that* is not a matter of claim or denial—it exists or it does not. If Howe denies it, all I can say is that he exemplifies it. He knows the religion of the people, and I am glad that he does not feel too superior to it. He fought with Tom Johnson at Cleveland, and gave up a promising law career because he could not make money out of a system which he clearly saw was riding 'on the backs of the people.' Of course, everything rides there; the people themselves ride on their own backs; I am riding on mine; so are my children and neighbors; it is the destiny of the race. Howe went into charity work, but was too honest to continue in it. Any honest soul will be disgusted with organized uplift work, sooner or later. He worked with Dr. Parkhurst in cleaning up New York, but he saw too clearly the point of view of the German saloon keeper who was driven into deviltry by the laws they made at Albany. He tried to show Dr. Parkhurst the bigger issues involved, but had no success. He was made United State Commissioner at the Port of New York, and then the war came on, but Howe felt too keenly the biting injustices imposed upon poor people by malice and cruelty to hold his peace. As an appointee of the President, he thought he could bring the Wilsonian justice and mercy into the service of those who had no friends—but he was told to shut his eyes and his mouth and let the nasty work go on. And so on, throughout his experience, until he saw at Paris the highest American ideals traded, and basely traded, to prevent one individual's personal humiliation.

"I would say that Howe's book—every word of which can be relied upon—should be read by young Americans. And they should then begin their thinking where Mr. Howe leaves off. I would send Mr. Howe to discover and describe an evil; I would not send him to discover the people who *consciously* maintain the evil, *knowing it to be such.* And it is rather unfortunate for the world, though fortunate enough for Howe's peace of mind, that he never did discover what that stonewall which he was always finding was made of.

"But the futility of reform, the baffling of the good heart of American intention, have never been better told than in *Confessions of a Reformer.*"

❦ ❦ ❦

***The Financial Journalist*** came into The Office and expressed the opinion that financiers were beginning to adopt a different attitude toward industry, especially in the matter of receiverships and exploitations. "It was once the custom—and in isolated instances still is—to regard the receivership as a wrecking agency, by which everything was to be reduced to money in the speediest possible way, at whatever loss. That idea is giving way to the more modern one that a business in difficulties is sick, and that it needs nursing, and that under a skillful receivership it may be restored to strong financial health. The more of that kind of work we can see, the sooner the breach between finance and industry will be healed. If finance does not exist to aid industry, what does it exist for? That same spirit is being manifest in great financial mergers of industrial concerns. Formerly these mergers could be regarded as purely financial, with no regard whatever for the industrial elements involved. The merger was made, the values inflated, the stock unloaded upon the public, and that was the end of the affair so far as the financiers were concerned. Nowadays they do it somewhat differently: I don't mean that all of them do it, but the modern ones, the best of them, do—they go into industry with a sense of responsibility for the industry itself and the part it plays in the life of the people. That is, certain financiers—the younger ones, incidentally—are getting away from the narrow ideal of money brokerage and are broadening into the ideal of the utilization of money in productive channels. When a majority of our financial men get this view, a bigger step will be made toward continuous prosperity than by anything that has been attempted thus far."

❦ ❦ ❦

***The Man from Alaska*** stopped in at The Office between trains. Speaking of the large reindeer herds and the native Eskimo herders of the Seward Peninsula, he said: "The natives are very religious. In one instance a herder owed the trading post a bill of $84 for necessities purchased. When called upon to pay he said, 'Jesus told me he would pay the bill. It will be paid.' The trader said nothing. He knows the $84 is gone forever unless the native receives a second visitation in which he will be instructed to pay it. This is not an evasion on the part of the native. He actually believes Jesus will pay the bill. White men of this particular district are known as 'Jesus men.' Each family of Eskimos have their own private herd of reindeer in addition to those belonging to the government which they handle. One native received a divine message in which he was instructed to start a reindeer herd for Jesus. The native set aside four reindeer. The herd has increased to 300 and is still growing. Not one is killed and the other natives assist in every way in perpetuating the 'Jesus' herd, as it is called." My informant said he firmly believes it will in time become the largest herd of reindeer in the world, as there is no cost in connection with its upkeep.

❦ ❦ ❦

"Regarding your article in praise of the way Americans speak English," said ***the Man at the Wayside Inn,*** "here is a true story. One of Mr. Longfellow's American friends was in Europe at a *table d'hote* where some English people were making fun of Americans for their pronunciation and queer phrases. When she could stand it no longer, she said in the beautiful English of the best families of New England—'We may not speak your language, but we understand it.' It was the cut direct, and it won respectful silence."

❦ ❦ ❦

"I have just come from Florida," said ***The Annual Tripper to the Southland.*** "Crowded out? No. The congestion you have read about was over early. You don't see the railway stations piled with baggage any more. No one is excited about the crowds. The publicity that went over the country about real estate and congestion and high costs of living certainly put a crimp into Florida. I saw hundreds of automobiles driving back North as early as New Year's. And real estate is not moving. I heard from pretty good authority that one of the biggest real estate concerns was in a serious way because of the failure of this winter's sales to come up to expectations. That doesn't mean losses or anything of the kind: it means that an unnatural boom period, left to run wild, has petered out. Florida decency did what it could to straighten out the worst of the fakes, but it began too late. A good deal of the damage had been done. If a community has a boom thrust upon it, you cannot blame it for taking all the money offered to it, but surely we are all old enough and wise enough in business matters by this time to understand that such things cannot last. One permanent effect a boom has, nevertheless; it always raises the level of normal prices. Unless a panic should ensue, Florida prices will never recede very far below boom levels. But the trading will be slower. And here and there a loss will be taken."

LIFE and literature need the inspiration which idealism quickens and promotes. The history of thought shows that a people given to sensationalism and the lower forms of materialism have run to ruin. Only that which inspires life and nobility of thought can maintain and preserve itself from speedy and ignoble decay. And we have too palpable evidence of corruption, public and private, to leave us in doubt as to the tendency of not a little of the cultivation and teachings in our times.

—*Amos Bronson Alcott.*

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week discusses the question of whether our present "ways" are adequate to the store of "will" which is now rising and active.

---

The world was unknown! Into it sailed Magellan and his crew of hardy ruffians. Ostensibly his going was for the glory of Portugal. Actually it was to get information for the great mercantile houses that helped to finance the journey. Vast seas lay ahead, vast seas and the waste places of the earth. Big Business was behind the venture. Charles Finger gives the first of his stories on *The Voyage of the Victoria.* (p. 16)

---

His pencil is more potent than any sword. With one stroke he slashes thousands of dollars from the nation's expenditures. His power is virtually absolute! He can nullify acts of Congress; he can disregard the will of the people. By title he is the Director of the Budget. (p. 3)

---

"You've got the first page, now, Governor, and if you treat us right you can keep it." Thus spoke an unabashed newspaperman at Woodrow Wilson's first conference with the press, following his nomination for the Presidency. *"But you will have to do some stunts . . ."* Wilson—sedate, pedagogic, somewhat austere—froze.

---

Dislike grew into antipathy. Unhappy encounters made Wilson at first guarded, then scornful. He refused to court publicity. The Washington correspondents were perplexed. They could not understand his attitude; it was preposterous! A President who refused to pose when ordered! Trivial? No! Very important! For these men interpreted Wilson to his countrymen. (p. 5)

---

Nature lives—by death! The beauty, the softness that overlies the earth serves only too often as a cloak for frenzy and violence. Most creatures that live prey on those that are weaker than themselves, and are in turn the victims of the stronger. From their first moment of light, life is for them a grim, harrowing experience of pitiless slaughter. (p. 2)

PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer; C. B. Longley, Secretary; W. J. Cameron, Editor.

A real task—one which took C. W. Barron, famous financial expert and author of this article, fourteen years. But Galli-Curci read the works of the great Scandinavian sage in a single summer! A new insight, and an interesting one, into the remarkable and diversified abilities of the noted singer. (p. 8)

---

Where is the London of yesteryear? Gone; as are the houses that Washington Irving described, and the streets, the inns and the people. The modern city has gobbled the old. But though the landmarks have vanished, the charm that the writer found still remains. The old London seems nearer to Americans because of Washington Irving. (p. 14)

---

Words are dangerous things! They are packed with dynamite. Their misuse leads to embarrassment, often to calamity. Wars have been caused by the reckless use of words, by their misapplication or misinterpretation. Only by words can we express the thoughts within us. Without them we are as dumb as the lower animals. There is a proper word to convey every experience in the human scale. Why not use it? (p. 29)

---

At heart he is not a bad fellow—the gorilla. He will fight humans only when cornered. His reputation for ferocity is largely unearned. Fundamentally he is not savage; he slays for food, or in defense of himself. His face is his true misfortune. The real danger in the gorilla is that *he* will be exterminated by overzealous specimen hunters. (p. 19)

---

Palestine is no longer the Promised Land! In spite of the Zionists, few Jews have migrated to their ancient homeland, where they still form a decided minority. Money is abundant; but it is sent in from the outside. Little is produced. The Jews realize that Syria today is barren, scanty of manna. To them America is the land of milk and honey. (p. 12)

---

You give a dollar for charity. How much of it goes to the poor? How much for administration? Philanthropy has become a business, technical and complicated. In the country if aid is needed, aid is given. In the city a report is written and statistics are gathered. (p. 6)

---

Whence springs the agitation to tear down the nation's immigration bars? What men are sponsoring the eighty-odd measures now before Congress? Their identity is in itself a revelation of their purpose. An important article on this attack on our country's barricades will be printed next week.

---

A letter from South Carolina: "Your paper has been placed in many of the homes of our city. It has become so popular with our people that one of the leading women's clubs has adopted it as the medium from which they select the programs for their meetings. It is becoming more and more popular with readers here. It is made up of the cleanest and most instructive articles of any magazine that comes into the hands of the writer. I think it a fine idea to close it to advertisements.—F. E. Clinton."

All Animals Wage Unending War for Mere Right to Live

By S. F. AARON

Left—A big fox squirrel is so formidable that the least sagacious weasel fears to attack.

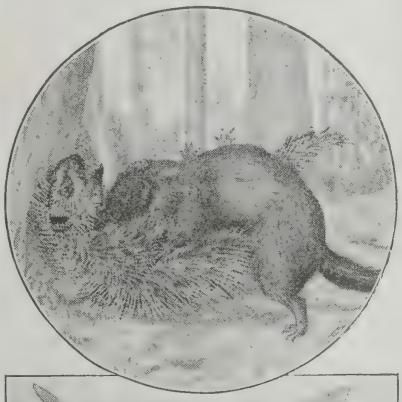
Circle—Pekan killing a porcupine.

Below—Robber fly attacks a ground spider.

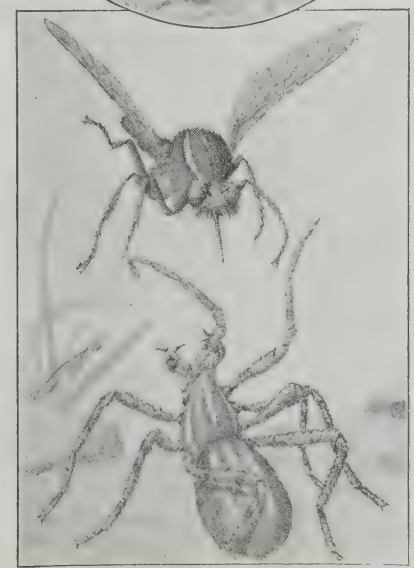
# The Killers' Struggle to Exist

THE term "struggle for existence," used with reference to the common processes of nature and especially to animal habits and characteristics, best expresses the almost perpetual seeking of food and dodging of enemies.

The sentimentalists, too often lightly influenced by the beauty and grandeur of Nature as carelessly observed, blunder with trite phrases regarding the aspects of peacefulness and loveliness. If the latter term may consist of any sort of undoubted attractiveness, however imbued with those features commonly opposed to loveliness, as cruelty, feudal hatreds, rapacity, none the less interesting if tragic and often horrible, then we shall not challenge the term. But as for the other, there is no such thing as peacefulness in all animate nature any more than there can be with a human army ready to attack or retreat.



Even those scenes that have moved the poets to sing of the tender mercies of Nature are really more fraught with dangers and more often interrupted by horrors than is commonly known. The nesting mother bird when she



"—feels the eggs beneath her wings
And the heart in her dumb breast
flutters and sings"

is nearer the influence or effect of tragedy than any sentiment bordering on happiness and contentment.

Warfare is the common impulse in nature inspired by blood lust, rivalry, or hereditary animosities. Perfect accord, where it does exist, is exceptional; it results from the need of mutual protection from enemies.

Among animals, from the microscopic plasmodium that destroys its host to the killer whale or orc, largest of carnivorous creatures, throughout the whole wide field of zoölogy, there are a far greater number impelled by predacious tendencies than by appetites exclusively vegetable. To enumerate the latter among the vertebrates of North America would be merely including the hoofed animals, the rabbits, the porcupine, the beaver and perhaps certain pocket gophers. All others have a taste for animal food; the true killers craving it almost exclusively, many vegetarians accepting it and often eagerly seeking it.

Even the innocent-looking chipmunk and that finest four-legged expression of grace and beauty, the flying squirrel, delight in what chance offers them in the way of birds' eggs and young, especially if the rightful defenders of the nest are not at home. The dainty little deer mouse, most inoffensive of quadrupeds, finds an insect diet so much to its liking that it sometimes hunts in winter for the hibernating species.

Among the birds, reptiles, batrachians and fish there is none that does not relish animal food, even the nut-cracking parrots eating largely of insects. During the summer the seed-eating finches and all the gallinaceous family, from bobwhite to the wild turkey, live mostly upon insects, and this may be said also of a good many swimming and wading birds.

Although the insectivorous creatures are classed apart from the flesh-eaters and are not referred to as predacious, they are killers nevertheless; often the agents of death in a manner to surpass the tragic deeds of the true Carnivora.

Hardly anything more pitiful can be imagined by the nature lover with a broad and universal sympathy than the flycatcher seizing a gay-winged butterfly and tearing the gorgeous thing apart, or the rifling of an industrious ant colony by the flicker's long, sticky, lapping tongue. A handsome ichneumon fly, lately

# Legislating in Secret Session

## Budget Officer Rules United States and Is Not Answerable to the People

By E. B. JOHNS
ILLUSTRATED BY W. W. CLARKE

LEGISLATION in secret session of a bureau is the result of the administration of the Budget Act. Laws passed by Congress which are carefully considered in the regular legislative committees now only amount to an expression of a wish—a hope, or a desire that the Government shall engage in certain activities. In the secret session of the Bureau of the Budget *appropriations are being refused to carry out the plain provisions of the laws of Congress.*

All of this is being done under the high-sounding title of a scientific co-ordination of the expenses of the Government. Any attempt to secure open hearing at which the Congress and the country will be informed as to why reductions or increases are made in appropriations for the Government are stigmatized as an attempt to break down the Budget System.

For the first time since the foundation of the Government have the members of the Cabinet been prohibited from going before Congressional committees and frankly discussing the needs of their departments. They are called upon to stultify themselves by pretending that the Budget estimates are sufficient, although they may be totally inadequate.

The making of the Budget begins with a great show of publicity. At a gathering which is called the business meeting of the Government (though no business is transacted in it), the President makes a speech. He dwells on the importance of economy and the reduction of taxation, which the entire country enthusiastically applauds. The Director of the Budget follows with a still longer speech in which he assumes that every reduction in the expenditures of the Government is a saving and an absolute economy.

No opportunity is given the members of the Cabinet to discuss the effects of the further reduction in the expenses of the Government upon its activities. In general terms and in the abstract the Cabinet members in their annual reports, previous to the so-called business meeting, have told the President the disastrous effects of previous reductions in the appropriations for their departments. They are not permitted at the business meeting to question the further reductions that are proposed.

> The United States is now ruled by a Budget Officer. No law of Congress can be made effective unless he supplies the money—and sometimes he doesn't. He reduces Army and Navy below policy strength by simply slashing appropriations. And he is not answerable to the public for it. The work is done in secret.
>
> *Read About This New Method of Neutralizing Congressional Government.*

With the broadcasting of the speeches of the President and the Director of the Budget the departments and the Bureau of the Budget go into a series of secret executive sessions. These continue until Congress convenes. During this long period no member of the Coolidge Cabinet is allowed to discuss the Budget estimates. But the Director of the Budget frequently discusses the Budget and the merits of the system in his public speeches.

The processes of paring, raising, and lowering the principal items in the Budget goes on in secret conferences. It must not be imagined that politics do not enter into making the Budget. Undercurrent statements are to the effect that there was some sort of a significant deal framed up by Secretary Hoover and the river and harbor bloc in Congress by which the Director of the Budget has ceased to cut the river and harbor estimates, as he does the other essential activities of the government.

From the beginning, the river and harbor bloc in Congress ignored the Budget estimates. The first year when the Director of the Budget pared the river and harbor estimates to fit in with the economy program the river and harbor bloc went on the floor in the House and raised them to the recommendations of the Army engineers. For the last two years the Director of the Budget accepted the engineers' estimates. Incidentally, Secretary Hoover has been the star speaker at a number of meetings of the river and harbor advocates. The Secretary also went before the River and Harbor Committee and urged large appropriations for inland waterways. Under the plan for the organization of the departments of the Government, river and harbor work is under the jurisdiction of the Secretary of War as one of the

civilian activities of the War Department, but the Secretary of the Interior seems ready to take over this work.

The public buildings of the country have not been as fortunate as the rivers and harbors. There is no organization advocating adequate public buildings like there is rivers and harbors and there has been no fixer for these facilities of the Government. It is now thirteen years since a public building bill has been passed by Congress. The chairman of the Public Building and Grounds Committee of the House in urging some legislation says:

"In many of the cities of the country the public business is being conducted in such overcrowded, ill-ventilated, and insanitary buildings as not only to reduce materially the efficiency of the employes, but to seriously jeopardize their health. In many cities postal employes are compelled to work under artificial light, both night and day. They are located in many instances in damp, insanitary basement rooms, and are so crowded that in numerous buildings the space where each employe works averages from twenty to seventy square feet. Undoubtedly human beings should not be compelled to work in buildings where the space allotted to them is less than 10 by 10 feet, or a hundred square feet.

***Handling Postal Business on the Sidewalk***

"During the holiday season for the last few years a number of cities have handled heavy parcel post business on the lawn or sidewalk under the protection of guards, but without protection against bad weather."

The only step that has been taken this session to relieve this deplorable situation is the reporting out a bill from the House Committee which authorizes an expenditure of $165,000,000 throughout a term of ten years. How much will actually be expended will depend upon the action of the Director of the Budget. Laws like the one proposed in the bill are no assurance that they will be carried out by the Director of the Budget.

A striking instance of this is the treatment of the Reclamation Service under the present system of administering the Budget. Under the Reclamation Act of 1902, a reclamation fund was created. This law provided that the funds should be maintained through the sale of public lands, royalties on oil and coal, and the money that is paid in the Treasury by the owners of land that has been reclaimed by the Government.

***Reclamation Funds Are Controlled***

The Secretary of the Interior, under the act, is given the authority for the distribution of the money on the different projects, which are approved by him and authorized by Congress. The money is to be expended for no other purpose than reclamation of the arid lands.

Yet the Director of the Budget has assumed control of the reclamation funds. He insists on submitting estimates for reclamation work, although such a staunch supporter of the Budget System as Senator Smoot declares he has no authority for such action.

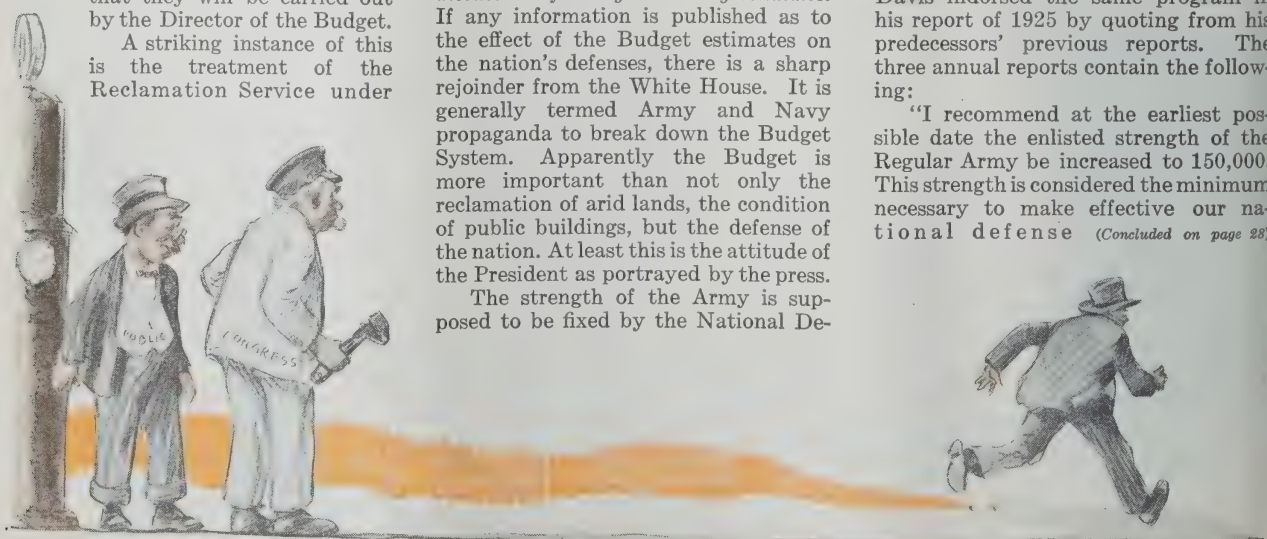
By his unreasonable reductions in the appropriations for reclamation work he is greatly retarding the development of the West. For instance, this year there is $12,745,742.96 available in the reclamation fund. The Director of the Budget submitted estimates for the expenditure of only $7,681,000. There are approved and partially completed reclamation projects which will cost ultimately about $60,000,000. If the Director of the Budget would permit the expenditure of the funds that are set aside for this purpose the projects would be completed in five or six years. Under his policy it will be ten or twelve years before they will be completed. The money is simply allowed to lay in the Treasury and the only possible purpose that can be in the mind of the Director of the Budget is a mere showing of a reduction in the appropriations to maintain the Government.

***Hushing Up Army and Navy Estimates***

*Special effort is made to suppress any discussion of Army and Navy estimates.* If any information is published as to the effect of the Budget estimates on the nation's defenses, there is a sharp rejoinder from the White House. It is generally termed Army and Navy propaganda to break down the Budget System. Apparently the Budget is more important than not only the reclamation of arid lands, the condition of public buildings, but the defense of the nation. At least this is the attitude of the President as portrayed by the press.

The strength of the Army is supposed to be fixed by the National Defense Act, and the Navy by the Washington Arms Conference. Before the advent of the Budget, after open hearing, Congress appropriated money to carry out the provisions of its acts, but under the present administration of the Budget the National Defense Act and the Naval Treaty are being ignored. No attempt is being made to maintain the Army, the National Guard, and the Organized Reserves, at the strength authorized by the National Defense Act. No one who has given the subject serious thought will contend that the Navy is at treaty strength. It is only necessary to cite President Coolidge's first message, and the annual reports of two secretaries of war, and two secretaries of the navy to sustain the statement that the strength of the Army and Navy has been reduced below the danger point in the secret sessions of the bureau of the Budget.

In his first message to Congress, delivered on December 10, 1923, the President said (the italics are ours):



"For several years we have been decreasing the personnel of the Army and Navy, and reducing their power to the danger point. **Further reductions should not be made.** The Army is the guarantee of security of our citizens at home; the Navy is the guarantee of the security of our citizens abroad. **Both of these services should be strengthened rather than weakened.** *Additional planes are needed for the Army, and additional submarines for the Navy.* The defenses of Panama must be perfected. We want no competitive armaments. We want no more war. But *we want no weakness that invites imposition.* **A people who neglect their national defenses are putting in jeopardy their national honor.**"

***When National Defense Is in Jeopardy***

Coolidge's Secretary of War in 1923, and again in 1924, outlined how the Army should be strengthened rather than weakened, as urged by the President in his first message. Secretary Davis indorsed the same program in his report of 1925 by quoting from his predecessors' previous reports. The three annual reports contain the following:

"I recommend at the earliest possible date the enlisted strength of the Regular Army be increased to 150,000. This strength is considered the minimum necessary to make effective our national defense

PART II.

Governor Woodrow Wilson and his family, photographed in 1912 immediately after receiving news of the nomination. Left to right, they are Eleanor Wilson (now Mrs. McAdoo), Jessie Wilson (now Mrs. Sayre), Mrs. Wilson, Margaret Wilson (with sweater) and Mr. Wilson.

# Why Wilson Disliked Reporters

## Distaste for Publicity Developed Into Aversion for Newspapermen Through Their Boorish Blunders

By HUSTON THOMPSON

ALTHOUGH Woodrow Wilson was a master in the art of creating and directing public opinion he knew little about the mechanics of publicity. He not only cared nothing about them, he even disliked them. Of his many marked characteristics this was one of the most interesting.

From the standpoint of the White House newspaperman, Woodrow Wilson was at one and the same time the poorest and the best "copy" that ever came to Washington. He was good "copy" because he did and said big official things, which made big news for the first pages of newspapers. He was poor "copy" because he would never do any unofficial publicity stunts. He would not pose for his picture. He would not "come outside" to be snapped with some important caller or delegation. He would not be dramatized, stage-managed, or standardized.

For example: In the 1912 campaign Wilson and Bryan held a big joint political meeting in Lincoln. It was the first time they had met since before the Baltimore Convention, where Mr. Bryan had played such a vital part in the Wilson nomination. I had come on from Denver to meet Mr. Wilson and travel with him through Nebraska and Colorado. Mr. Wilson was to spend Sunday with Mr. Bryan at the latter's home at Fairview. It was big news and a dozen newspaper photographers were on hand to make pictures of the historic event.

After the preliminary greetings at the railroad station the photographers asked the crowd to step back, so that they could get a picture of Mr. Wilson and Mr. Bryan. The crowd good-naturedly obeyed. The two heroes of the occasion faced the cameras and were snapped.

"Wait a minute," said one of the photographers, "we want to get you shaking hands."

*"I'll Not Pose, It's Too Artificial"*

Ninety-nine public men out of a hundred would have smilingly acquiesced. Mr. Bryan, who knew the value of publicity inside out, smiled and stuck out his hand. Mr. Wilson frowned.

"No, I'll not pose," he declared, "it's too artificial."

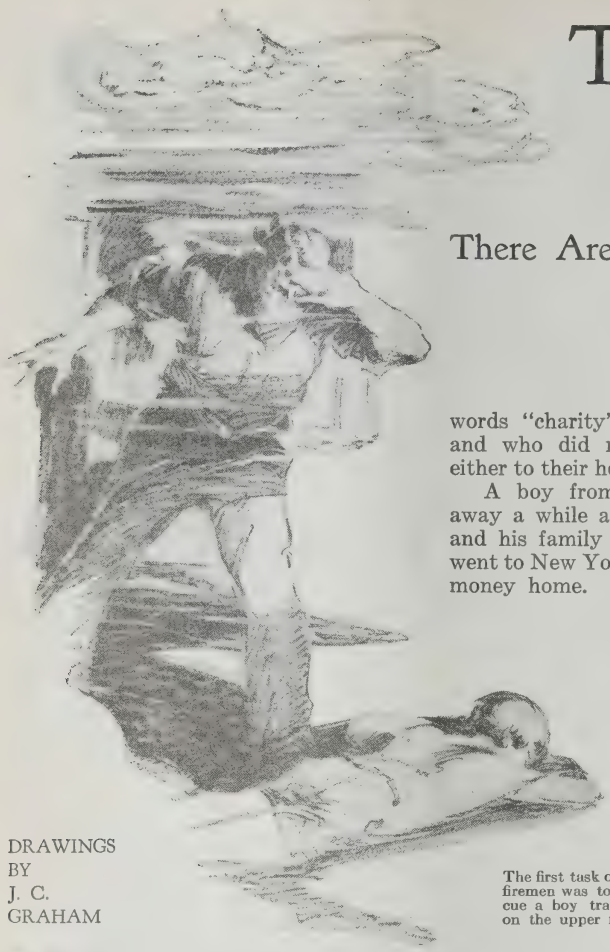
Mr. Wilson flatly refused to furnish advance copies of his speeches. He would not change his plans or accept suggestions from the newspaper correspondents, although such action frequently would have resulted in more and better publicity. On this same 1912 campaign trip in the West a correspondent traveling with him asked him at breakfast about 9 o'clock one morning for an advance synopsis of two or three hundred words concerning a speech to be delivered at 1 o'clock.

"You know, Governor," the correspondent said, "the World's Series starts today and unless we can get an advance of your speech, to be sent out during the forenoon, we won't be able to use a line of it. From 1 o'clock on the wires will be closed to everything short of the assassination of a President."

Mr. Wilson's long lower jaw snapped shut and his eye flashed for a second. Then his face relaxed into a smile.

"I know it is highly presumptuous of me," he said, "to run for the unimportant position of President of the United States while the World's Series baseball games are being played, but nevertheless I'm going to do that very thing."

He did not give the reporters the advance synopsis and the result was exactly what the correspondent had predicted.



Mr. Wilson's mental attitude toward most newspapers and some newspapermen was tinged with contempt. "If you see it in the paper it's not so," he frequently remarked, more in earnest than in jest. The correspondents, especially in Washington, where the corps is generally composed of able, older men, sensed Mr. Wilson's attitude early in his career. Frequently during the 1912 campaign, and afterward at the White House, his attitude was openly and directly expressed. It caused amazement because it was so directly at variance with the historic attitude of men in public life.

# THE FALLACIES OF PHILANTHROPY

## There Are Some Glaring Inconsistencies in Organized Charity; Is There a Remedy?

By ARMSTRONG PERRY

DRAWINGS BY J. C. GRAHAM

The first task of the firemen was to rescue a boy trapped on the upper floor.

THE fire siren shrieked. Instantly the streets of the little village were filled with excited people. Some learned the location of the blaze from the telephone girl. As they ran, they thought of the thirty years it had taken to establish the home that was now threatened.

Even before the alarm had been turned in, the nearest neighbors had helped the father and mother to rescue an invalid boy. Others had broken the fall of the sixteen-year-old daughter who, driven from her bed by the smoke, staggered gasping to a window, climbed onto an icy porch roof, slipped, and fell to the ground.

The first task of the firemen was to rescue a twelve-year-old boy, trapped on the upper floor. After braving smoke and flames, they found him dead, within five feet of a window.

The fire was extinguished, and the village doctors ministered to the injured in the homes of neighbors.

The next day, the man's employer moved a willing tenant out of a house across the street from the damaged home, and moved the afflicted family into it, so that rehabilitation could start with the minimum of inconvenience. Someone else started a relief fund. Within twenty-four hours, every burden that could be borne by others had been gladly shouldered by people, most of whom had never learned the distinction between the words "charity" and "philanthropy," and who did not think of applying either to their help in time of need.

A boy from the same town ran away a while ago. His father was ill and his family desperately poor. He went to New York to get a job and send money home. A fire broke out in a tenement near the one in which he occupied a hall bedroom. Rushing to the spot, full of the desire to help, he was thrust back by firemen. Standing outside the rope that was stretched to keep the crowd away, he saw death and destruction stalk through the doomed dwelling. He saw thieves snatch articles from the household effects that were carried out. He saw shivering women, wailing children and dazed men led away by policemen to whom misery seemed to be an old story. Moved to inquire what would be done, he was told that probably some organization would take care of them.

This boy of seventeen visited a Young Men's Christian Association. He was invited to a religious service and a Bible class supper. The gymnasium and other attractive features were shown to him. It all interested him very much and he wanted to join, but he found that the membership fee, cost of gymnasium suit and other initial expenses amounted to three times his weekly wages. There were men in the Association, of course, who would have been glad to help, but self-reliant young men do not like to become objects of charity.

Philanthropy is a beautiful thing in its hand-to-hand working with those in need, but in its modern, highly organized forms it sometimes loses power.

A modern philanthropic organization includes four classes of persons: the beneficiaries who are supposed to benefit by its work; the volunteer workers, who serve without compensation; the salaried professional workers, and the contributors who give money, freely or under pressure, to pay the bills. Outside, are the 92 per cent of well-to-do persons who could afford to contribute but who give nothing and the 95 per cent or more of the population who, according to the professional workers, ought to be reached by the work, but are not.

Some beneficiaries harbor certain fallacies. One is that everything a philanthropic organization offers should be free of charge. Why should it? Who wants to be pauperized? Another is that the charges made by the organizations yield a handsome profit. They do not. A Young Women's Christian Association cafeteria will be criticized for its seventy-five-cent meal while the head waiter of a big hotel retires to a castle in Europe with a fortune gained from patrons who paid five times the Y. W. C. A. prices for food that was no better.

In the country districts where philanthropy is unorganized, where it is set in motion by a real and visible need, and where no charge is made for service, such fallacies do not exist but the moment philanthropy is placed in charge of professional officials and financed by persons unknown to the beneficiaries, they arise.

*An Unlimited Field for Beggars*

Philanthropies must have system. If certain types of cases cannot be conveniently included, they are conveniently forgotten. For example, farm boys, because of the difficulty of reaching and organizing them, usually are left out of philanthropic plans although they constitute about 50 per cent of the boy population and have obvious needs. Worse yet, they sometimes are included, nominally, but given no real share of the benefits. Meanwhile, in some cities, philanthropies compete for the interest of the middle-class boy until he must feel like a greased pig at a Fourth of July celebration when the crowd is let loose on it.

There are so many philanthropic organizations that an investigation in New York, some time ago, revealed the fact that a beggar could secure food, clothing, and shelter for two years without applying to the same one twice. By that time he would be forgotten by the first one that aided him

ad could start making the rounds again.

Conditions such as these brought ito being organizations of te Associated Charities pe, designed to coördinate forts. The latest develop- ent is the Community Chest hose guardians col- ct contributions and stribute them among proved organiza- ons, according to eir respective needs according to the pres- re which each is able to ing to bear.

One beneficiary defined ilanthropy as "giving it ck." In a sense this is true, r no man can accumulate the ice of a college building, a blic library or a park without the sistance of many workers; but it is a llacy to assume that giving it back cash will solve any problem. The ead of a large corporation was ap- oached by a workman who demanded:

"Why don't you divide your in- me with the men who help you make !"

"That's a good idea!" the million- re answered. "I'll begin right now, ith you."

Dividing the amount of his income y the number of employes, he showed s caller that it would give each of em twenty-one cents a month. "Here your twenty-one cents," he said. Be sure to come back every month r your share."

The volunteer workers cherish some llacies also. In the majority of hilanthropic organizations, the vol- nteers constitute a large majority. or example, in the Boy Scouts of merica there are more than 168,000 olunteer officials and less than one ousand salaried officials. Under such system, the volunteer workers often el that since they are bearing the runt of the work, the duty of the verhead professional staff should be lighten their labors. Such is the in- ention, but the effect of overhead rganization, nearly always, is to make ore work for the volunteers. A outmaster remarked that the paper ork requested by the national office— eports, statistics and what not— ould require all the time available for ork with his troop, if he did it.

The more philanthropy organizes, e more the labor and the expense crease. The relief and rehabilitation a family whose home has been rned, so easily handled by sym- thetic neighbors, becomes difficult hen handled through an organization. irst, there must be an investigation y a trained and salaried worker, who ay ask embarrassing questions about e family income and other matters. ommittees must meet and decide hat needs to be done and how to do . Superior officers, who may be far way, must gather impressions from ritten reports and authorize expendi-

Rushing to the scene of the tenement fire, he was thrust back by firemen.

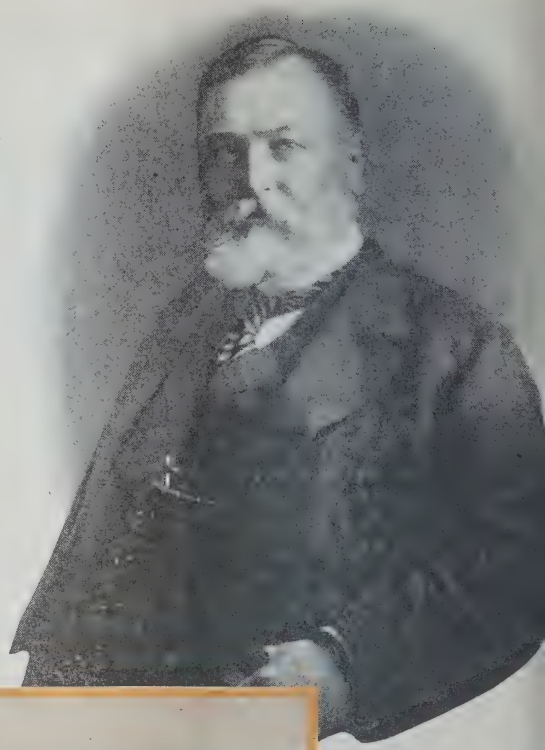
tures. No one is free to go ahead and do the simple and obvious things that neighbors can do. Everything must be made to fit the system and the budget.

Some of the fallacies of the professional, salaried officials of philanthropies are developed by what has been described as "biting off more than you can chew." Whole-hearted, overburdened volunteers, carrying the local work and helping to raise money to support salaried workers, sometimes yield to an impulse to become salaried officials themselves. It is an alluring prospect, for a man who has been a blessing to one community, to think of organizing and directing work that shall do the same things for a hundred or a thousand communities.

But in a year or two, the impressions made may begin to fade. There was a world of satisfaction in being on the spot when the home burned, in helping to rescue those in danger and in signing the subscription paper. A very different feeling comes over a philanthropic executive when he sits at a desk with statistics showing that there are 25,000 cases in the state needing attention, and that his budget is running low and must be replenished by a financial campaign. The whole scheme sometimes develops into a highly professionalized game for executives in which are used tactics borrowed from everything from football to draw poker.

One fallacy that the professional worker is almost sure to acquire is that the volunteer should be able to learn the system, do all his work and send in his applications, reports and statistics promptly and in the prescribed way. There is no way in which a man who spends his days pushing papers over a desk can understand the viewpoint of a man who works eight to twelve hours a day earning a living for a family and then gives an evening or a day a week trying to do something to help the rest of the community. The recurrence of mistakes, which the office man sought to eliminate by publishing a paragraph in the official organ, irritates him and makes him feel that the men in the field are fools. The volunteer, on the other hand, often feels that a handbook of several hundred pages, application blanks of four or more pages, and report forms in any number, is too much red tape for a man to bother with when he has people to attend to. It is always interesting to hear local workers talk frankly about the national headquarters.

One fundamental fallacy in philanthropy is the be- *(Concluded on page 31)*



A man investigated 36,000 beggars' cases and reported that he did not find one who needed the alms.

# Galli-Curci Swayed by Swedish Mystic

## Prima Donna Gives Wonderful Interpretation of the Writings of Emanuel Swedenborg

By C. W. BARRON

THIS article combines three remarkable personalities. Galli-Curci, the great singer, who is the subject of the article; Clarence W. Barron, owner of the *Wall Street Journal* and world-famous financial authority, who is the writer of the article; and Emanuel Swedenborg who may be called the Spirit, the *raison d'etre*, of the article. We present it for the pleasant light it throws on all three.

I HAD thought to head this article "Galli-Curci, the Brain Woman." It would have been misleading to many; because Galli-Curci, while holding the most wonderful brain that I have met or heard of in woman, is much more—a true woman with a life and soul of affection for all that is ennobling and uplifting in the family, and in color, form, and music.

No one can have read her account of herself in four articles in *The Ladies Home Journal* without having been astonished at the breadth and fullness of her life in art. But there is another side to her developing life that I would present.

The work and writings of Emanuel Swedenborg, whether in the domain of science or theology, are beyond the reach of the majority of mentalities. As an economist writing state papers on weights, measures, coinages and currencies, he is easily comprehended. As an engineer transporting ships overland he is easily visualized. As the head of the great mining industry of Sweden, writing practical books on mining and smelting, declared to be the foundation of modern metallurgy, he is of interest in the encyclopedia of scientific history. As the writer of volumes—original studies in search for the human soul—he is not without human interest.

But when one comes to the realm of the unseen, where there is neither time nor space upon which to rest mental conceptions, few may enter into the fullness of the revelation which has come into the libraries of the world through Emanuel Swedenborg, and concerning which no one can yet declare whether it is a philosophy, a religion, or a science

C. W. Barron and Amelita Galli-Curci, from an autographed photograph to Mr. Barron.

Think of twenty modern-sized volumes, originally written in the Latin tongue and unfolding from the Hebrew of *Genesis* and *Exodus* the internal or spiritual sense that lies beneath the letter. Another dozen more similar volumes that not only expound every picture set forth in the book of *Revelation* as conveyor of a tremendous truth of universal application throughout invisible degrees of creation and life, but also illumine all the problems of sex as presented throughout the universe from the union of the love and wisdom in the divine down to sex crystallization in the mineral kingdom; include the deepest of all works ever written entitled, in the original Latin, *Angelic Wisdom Concerning the Divine Love and the Divine Wisdom*. Then answer to yourself the number of years that ought to be required to master these thirty-two volumes.

(Continued on page 23)

# MR. FORD'S PAGE

"WHERE there's a will there's a way" is probably universally true, but one should not conclude therefrom that the "way" as the channel or vehicle of the "will" is a minor consideration. Periods of history which are marked by the rising of the human Will have proved dangerous when not provided for by adequate "ways." That is all that makes a flood destructive, the lack of "ways" to convey the force of the waters.

Yet there is generally more energy used in efforts to arouse the Will than to provide the Way. Perhaps this is altogether right in most periods of human development. In the absence of any great show of Will it may be necessary to concentrate on its arousal, trusting to events to make a Way. But when the dynamos of human Will have been started and their power increased, and the energy becomes more plentiful than are the ways in which to use it, then the question of utilization—the question of the "way"—becomes insistent.

There is beyond question a great Will toward a better social system rolling up on the horizon of human consciousness; is there a Way in which it can flow to fruitful fulfillment? Is humanity ever prepared beforehand for that which is plainly seen to be on its way toward us? Do we ever control the direction of our development? Do we ever prepare a highway for the Will that seems certainly advancing upon us?

*THAT rare and invincible human energy which comes in the form of Will has never been too plentiful in the world. To create it and arouse it to action has been the purpose of long effort. "Where there's a will, there's a way" has been the encouraging word. Now, however, with a rising tide of Will in the world, we are beginning to sense the importance of its having a Way. The misdirection of energy is an element in all tragedy. The question today is Where's the Way for the Will? To know which way the tide of energy will move and provide it "ways" is to be wise in one's generation.*

Programs are exceedingly tedious things when there is nothing to fill them with, and plans of campaign are mere mockery when there is no moral energy to make them go. And one sees that everywhere in the world today—programs and plans of campaign with no energy in them, and great headwaters of Human Will and Desire and Vision with no channels—no programs or plans of campaign—in which they can flow.

One is not even prepared to say that these two parts should be brought together. One is not at all convinced that the coming tide of human energy is going to flow into the channels men have now built ready for them. They don't seem to fit. The mappers of the Way have not seemed to understand the velocity and weight of the Will. They have not caught the direction of it. There is a vague sense that perhaps this flood of new Will might contain elements of danger and that the best thing to do would be quietly and quickly to lead it into convenient and conventional channels and let it trickle away harmlessly.

But it is probably not the function of the Way to control the Will, but it is probably the right of the Will to have a Way which answers to the reason for its arousal and the direction of its purpose.

If statesmen are those who clear the way for Almighty God, the true Way-Mappers are not those who would trap and control the rising tide of Will, but those who would hasten it by adequate Ways to the point where it is going. It is scarcely possible that anyone should successfully harness this new and rising tide of Will to turn his own private water wheel. And yet that is what nearly all the prepared "ways" of these times suggest—the effort of this institution or that cause or the other campaign to utilize the rising Will to be its own private motive power.

That cannot be done. Wisdom consists in trying to determine which direction the rising tide of Will is likely to take, and building ways for it to flow in that direction. That is all there is to prophecy, statesmanship, luck, success, service—knowing which way the stream of life is moving now, and preparing a Way for it to go.

It is rightly said that the interests of the age are material, but it is wrongly meant. The interests of the age are in material things because it is in relation to material things that injustice most frequently shows itself, and hindrances to the beauty of common life most frequently arise. It is not things themselves that engage men's attention and vision, but the justice and the common beauty which these things now serve to obscure but which they may be made to serve. The Will that is headed toward the situation with regard to material things is not itself a materialistic thing nor is its interest in anything less than that most spiritual quality—justice.

If we are able to reach a conclusion what we would first do for the world if we were able, if we can reverently imagine what the Almighty would do for the world today if humanity permitted it, then it is possible to form some idea of the direction in which the rising tide of Will and energy is moving; and from this we may reach a conclusion as to where and how the Way ought to be built for the triumphant passages of the Will to Social Justice.

## *Who Is the "Laughing Stock" Now?*

THE reluctant conclusion is being forced upon citizens that it is not the law so much as the Government that is being made a "laughing stock"—to use the stalest current newspaper platitude—these days. There is nothing whatever against the law which excludes a Vera, Countess of Cathcart, from these shores, but there is a great deal against a Government which backs and fills with the law because that lady is able to bring pressure to bear. And what makes the Government look rather more foolish is the fact that even the courts are made to play their little contributory part in what resembled a piece of publicity for a very feeble stage play of which the Countess is said to be the author. This was hinted at the first, that "the play's the thing," and the Department of Labor, court proceedings, bally-hooing lawyers, incessant interviews and general pooh-poohing of the American contempt for irregular women were only scenery and bill-boarding for the play.

In all this we are ready to admit that the Countess of Cathcart, with very trivial skill, has outwitted the men whose occupancy of office requires them to be referred to temporarily as the Government of the United States, and has made *them* a laughing stock. The country is ashamed of them.

The same conclusion prevails with reference to the no-liquor law. The aliens have proved themselves able to outwit the men who temporarily comprise our Government. The bootleggers are better organized and have more brains—or use more—than our enforcement agents. The no-liquor law still stands in austere dignity as the sign and symbol of this nation's readiness to deny itself for the sake of its higher life; *it* is no laughing stock. But the men temporarily masquerading as Government, miserably failing to observe their oaths of office and to use the means which the people afford them, are the laughing stock in this matter. *They* have failed, and not the law. The bootleggers are the Countesses of Cathcart of the Prohibition law.

We append a few of the names of the recent list of the indicted as published in the current newspapers. These are the men whom our law-officers say they cannot control. Any committee of private citizens could easily accomplish the task of law-enforcement on these people.

St. Paul—Benjamin Gleeman, Harry Gelman, Morris Roisner, Nathan Bader, Samuel Harris, Abe Ginsberg, Morris Miller and Benjamin Weiss, Leon Gleckman, Louis Roisner, Harry Bernstein, Jack Gleckman, Samuel Gleckman, Abe Gleeman, Nathan Gleeman, Morris Zuken, Al Wender, A. Saxon, I. Saxon, Morris Goldberg.

Philadelphia—Benjamin and Frank Fogel, Benjamin and David Gersonstein, Albert Haimowitz, Charles Schwartz, Herman Fuererstein and Nathan Sawinski, James Silberstein, Ed. Silberstein.

---

## *Answering Back*

IT IS reported in the press—and we naturally make considerable allowance for detail—that an actor was arrested for interrupting the Rev. John Roach Straton in a sermon in the theater at West Palm Beach, where the New York divine is holding forth this winter. The exodus of ministers south in the winter and north in the summer suggests that Satan is now a commuter. Anyway, the papers report that Dr. Straton said some uncomplimentary things about actresses (which seems very unlike him) and that one Stuart Robson arose in the audience and protested on the ground that his mother was an actress. It seems quite right that a son should thus defend his mother even though she was not in the mind of the speaker nor her relationship to Robson known. The curious element in it all is that the man should have been arrested for disturbing Dr. Straton's meeting. One can hardly imagine the Doctor objecting to disturbance. He welcomes each rebuff which turns a formal smoothness rough. He probably does not regard the pulpit as "coward's castle" where a man may say what he pleases free from challenge. The ideal public meeting is one of give and take. Of course, there should be some orderliness about it. The inherent right to ask a question is observed everywhere in Great Britain. But here in the United States the right to speak out in public departed with the old town meeting; we sit mute. Our philosophy in regard to disputers is packed in the pithy modern proverb: "If you want to talk, hire a hall." Still, it might be regarded as true that every auditor who helps pay for the speaker also helps pay for the hall, and therefore has a certain right in it. No speaker worth his salt wishes to speak to a muzzled audience. And anyone who can get a word in edgewise of one of Dr. Straton's addresses is by that fact marked out for consideration as being no mean citizen.

### *NO—Don't Let Them See It!*

NO, WHATEVER we do, we must not permit the public school generation to see the Bible. We must not permit them to see or hear anything concerning the practice of prayer.

We may still permit the President to take his oath of office on the Holy Bible.

We may still permit the United States Senate to open every session with prayer by a chaplain paid by the Government.

We may still permit the House of Representatives to open every session with prayer by a chaplain paid by the Government.

We may still permit our ships at sea the services of naval chaplains who read the Bible to the sailors and marines, and pray in their hearing, and are paid by the Government.

We may still permit the Government to appoint and pay chaplains for our army posts at home and abroad, and maintain an army chaplain's school for the preparation and training of men who read the Bible and pray for and with the United States soldier.

The National Republican Convention may still open its daily sessions with prayer.

The Democratic National Convention may still open its daily sessions with prayer, yea, though the Convention run for three stormy weeks.

Our separate States may provide chaplains for the prisons and penitentiaries, whose business it is to read the Bible and pray with and for the unfortunate.

But the ten or fifteen future Presidents who are now in our public schools—

The future Senators, Representatives, party leaders, officials who are now by the thousands in our public schools—

We must keep the Bible from them!

We must keep the knowledge of prayer from them!

We are permitted a Christian form of Government, but we are forced to maintain a pagan public school!

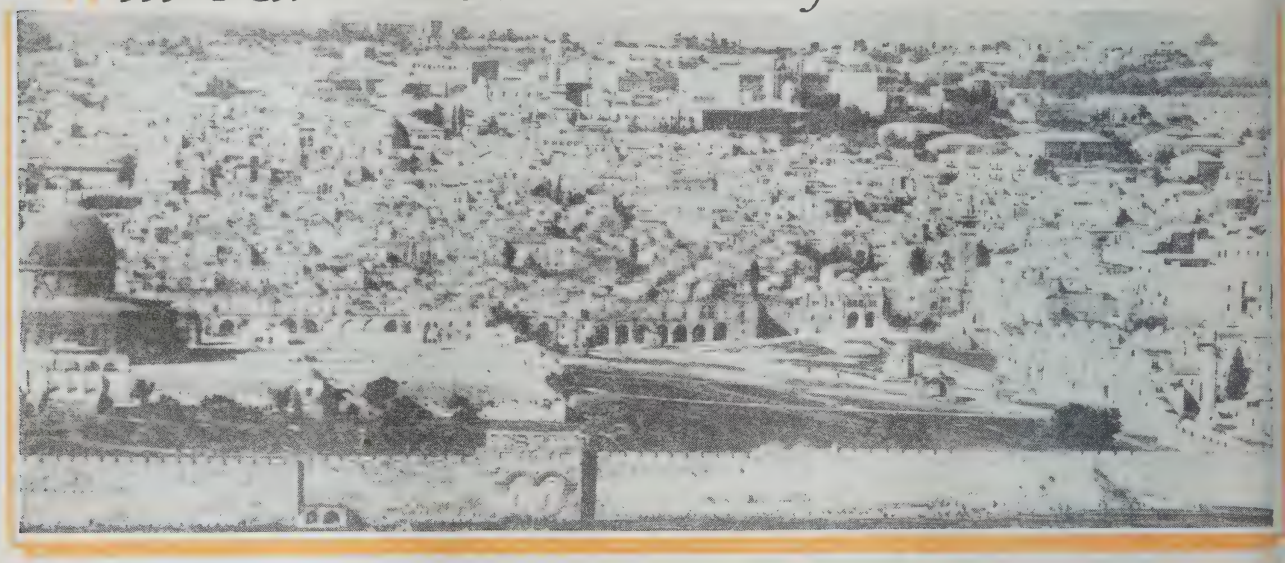
Every President of the United States to date has been reared in a school that was opened by Bible reading and Prayer.

Why not our future Presidents also?

It is a question hammering for an answer from the conscience of the American people.

---

### *French Gymnastics*



M. PIETRI, described as one of the ablest and most active members of the Finance Commission of the French Chamber, has come to the conclusion that not only does France owe Great Britain nothing, but that, on the contrary, Great Britain is in debt to France. The same, he insists, is true as regards the United States. In answer to the question "How come?" he readily replies. "Hitherto," he says, "we have not contested our creditor's bill; now we must discuss it item by item. If we thus examine the items of our debt we shall find that the total includes not merely the price of the goods, munitions and supplies that were sent to us, but also the sellers' profits, and, in addition to that, the heavy taxes on war profits which the English and American governments imposed upon their manufacturers, and which the manufacturers, in their turn, levied from their customers. These enormous profits taxes the British and American governments have already collected. By not deducting them from the sums they are now claiming from us, they are trying to collect them a second time." Well, it sounds very plausible until one reflects that if the munition manufacturers, et cetera, had not been making munitions, et cetera, for France they would have been making something else for somebody else, with profits for themselves and taxes for the Government into the bargain; that the bill would have been paid long ago and no questions asked; and that the money thus received would have been turned over again and again to larger profit still. M. Pietri will have to try again.

---

### *Confiscated—Mussolini*

MUSSOLINI sometimes seems puzzled by the opinion held of him outside of Italy. In his inability to understand is to be found the element which will eventually dispose of him. The charge against him today stands in this fashion, that he has established an intolerable tyranny over the opinions of his people. Much of good he has done; no one questions that. Qualities of strength have marked some of his actions; that is gladly acknowledged. But it is too evident that he, who once was headed for Bolshevism via Socialism and the destruction of authority, has now almost reached Bolshevism via politics and the abuse of authority. We do not need to rely on conflicting statements from abroad in these matters. The New York papers report that the Italian Consul General in that city has notified the editor of an Italian newspaper published in New York that his old home in Italy has been confiscated by the government because criticisms of Facists have appeared in the New York publication. This is a very commonplace action of a political régime which Mr. Otto Kahn covers with great praise.

# Will Palestine Ever Pay Its Board?

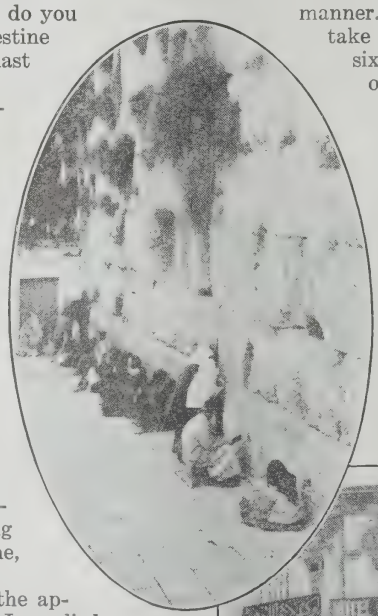
Old Jerusalem, the outer aspect of which has changed little through the centuries.

## Money Is There Now, But It Is Not Money Which Was Dug Out of the Soil Either as Ore or as a Crop

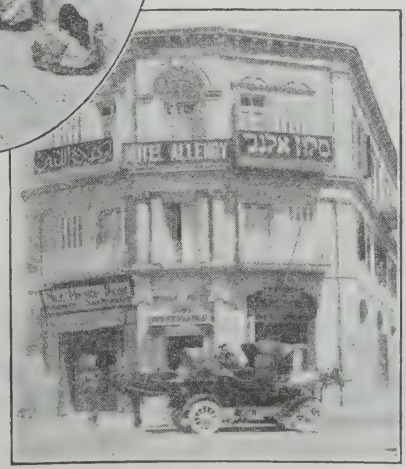
By WILLIAM E. BARTON

"WHAT changes do you note in Palestine since your last visit?"

This was the question which met me as I recently journeyed through the Holy Land. I had not been there since the War.



I answered, "Good roads, red roofs, automobiles, the presence of British soldiers, and the absence of lepers from the streets."



"Do you not include the widespread prosperity?" one intelligent American, long resident in Palestine, asked me.

"I might include the apparent prosperity," I replied, "and I am glad of it, but I am at a loss to attribute it to anything that can be made permanent; money is plentiful, and beggars are few. But is the country really prosperous?"

One gets a variety of answers.

Modernity jostles antiquity in present-day Palestine. The ox and ass turn out stolidly and insolently to give room to the intrusive automobile. A train of camels moving along the railroad track, where no better road is provided, takes the siding for the express from Kantara, and the two hoot at each other, each after its own manner. It is now possible to take the train in Cairo at six o'clock at night, eat one's dinner in a dining car, rest fairly well in a sleeping car, and eat luncheon promptly at noon in Jerusalem; or one may land at Haifa in the morning, take an automobile for Nazareth, eat luncheon beside the Sea of Galilee, and sleep that night in the Grand New Hotel which is neither new nor grand, or in the New Allenby, which is the old Du Parc in Jerusalem. Jerusalem hotels are about the only things that have not changed. Those that I have named are the best now, as they were a quarter of a century ago, and neither of them is very good or ever was. They might, however, be worse.

Oval—Celebrated Wailing Wall of the Jews. Lower—Hotel Allenby, Jerusalem.

But what about this prosperity of which one becomes immediately conscious, and what about the Jews whose coming in such numbers has created this prosperity? Other war-ridden countries are crushed and feebly attempting to rise. In Palestine money is abundant. That painful poverty which was formerly apparent on every side is largely gone.

There can be no doubt about the rapid increase in the number of Jews in Palestine. It is claimed that not fewer than 30,000 Jews migrated to that land in 1925. This is equal to more than one-third of the entire Jewish population there in 1922. If we compare such an immigration with the "quota" which the United States permits in any one year, we shall be impressed at once with the fact that such an influx is quite as large as can easily be assimilated. It is claimed by zealous Jewish authorities that there are now as many as 130,000 Jews in that land; others say that this is an exaggeration, and takes no account of the outgoing tide, which is considerable. The whole population of Palestine at the outbreak of the World War was not over 600,000, and it is somewhere between 800,000 and 900,000 today. For thirty years before the War, Baron

Rothschild had diligently sought to encourage Jewish immigration to Palestine, and succeeded at the rate of about 1,000 a year, or 30,000 in a generation. Those Americans who visited Palestine before the War were not highly impressed by the average of these immigrants. There were Zionist colonies, and some of them were doing well, but the average pre-war Jew was not a farmer, and we do not yet know that the newer Jewish immigrant is a better one.

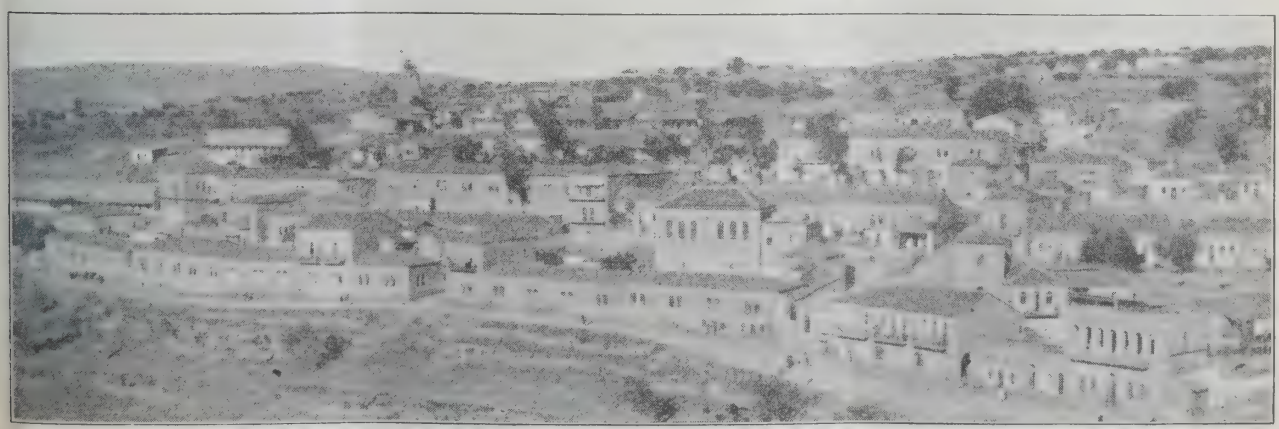
But since the War the increase is enormous. More Jews entered Palestine as intended residents in 1925 than the total net increase for 30 years under Baron Rothschild. New colonies are springing up in the most fertile parts of Palestine, and irrigation projects are under way in other parts.

Still, only about one-eighth of the population of Palestine is Jewish, and the increase is attended by serious difficulties. In so far as it is presently successful, that success is achieved by a process of depopulation and repopulation all the more effective because it is not done violently.

The average American visiting Palestine and seeing large areas of land transferred from Arab owners to Jewish colonies, asks, "Don't the Jews pay for all they get? Well then, whose business is it?"

But the intelligent Arab answers, "You Americans view such matters as belonging to the individual alone. The Jews do pay for all they get. They pay double, treble, quadruple prices. Thus they outbid all possible competitors and plan to make over the population of this land. This country does not belong to the Jew. It has been ours, undisputed, for two or three times as long as America has known the presence of the white man. Naboth's vineyard is being taken from Arabian ownership not by perjury or oppression, but by Jewish gold poured into a Zionistic treasury. Our race, our religion, are being dispossessed, and we are powerless to prevent it."

Natives of Palestine at work on an ancient threshing floor.



It is nearly two thousand years since the Jew had any part in the ownership of Palestine. The kindgom of Israel went down in 721 B. C. The smaller kingdom whose capitol was Jerusalem went down in 586 B. C. The land was ruled successively by Assyria, Babylon, Persia, Greece, Syria, and Rome.

Jerusalem was destroyed by Titus in A. D. 70, and the land was knocked about from pillar to post until the Crusades, when for a time it was under Christian influence. For seven hundred years and until the World War, it has been controlled by the Turks, and very badly controlled.

These changes have almost obliterated everything that was significant in the political and religious life of Judaism. The shrines of Palestine are mainly Christian shrines. The Jews have but one sacred place in Jerusalem that possesses any considerable element of antiquity—the wailing place at the site of the few remaining stones at the foundation of the ancient temple. But Bethlehem, Nazareth, Calvary, Gethsemane, the Sea of Galilee and a score of other of the most visited of Palestine's sacred spots are purely Christian in sentiment. Palestine is no longer in any important sense a land of Jewish associations; its sentiment is Christian.

But the Jews of all the world have no other land to which any sentiment whatever is attached. They lived for a millennium in Spain, but Spain is not the land of the Jews. They have been for centuries in Germany, but Germany is not a Jewish land. They have constituted for innumerable generations a large proportion of the population of Poland, and they have no love for it as belonging to them. They have been in the United States since the days when New Amsterdam was a Dutch colony and there are about one and a half million of them now in New York City, but this land is not their national home. And they have a sentiment based in a cherished historical tradition that makes them think of Palestine as their own.

This feeling goes back to the time when every nation and tribe had its own god. Naomi never questioned that if her daughters-in-law returned to Moab they would go back to Moab's religion, nor did Ruth doubt that if Naomi's people be- *(Concluded on page 22)*

A Zionist settlement just outside the walls of Jerusalem. Jews are being invited to Palestine by this sort of colonization.

# Washington Irving's London Has Gone

## The Glamour of His Descriptions Persists. Though the Landmarks Have Vanished

By DUNCAN MACCONNELL

TWO nations may be gladdened some day to see the better sentiments of England and America given noble embodiment—in a statue of Washington Irving in London.

Washington Irving.

It will not matter whether the sculptor is Yankee or Briton. It will not matter whether the monument is a gift of the United States to the United Kingdom, or a gift of London to the memory of a native of New York. In either case it will enrich and ornament both lands. For no other figure, of real life or poetic allegory, could so personify the present manly sympathy and upright understanding of these nations. To this day the sweetest and soundest expressions of this better feeling are found in the writings of Irving. The present-day eloquence of Anglo-Saxon concord proclaims, after the jangling rivalries and suspicions of a century, the truth which Irving proclaimed before the century began.

Irving was a stout American, upon whose head in childhood the hand of Washington rested while the stern and impersonal chieftain uttered a personal blessing. Irving was so stout an American that he refused to write for the London *Quarterly* because it had been unfriendly to his country. Yet, as he was the first American interpreter of British life and character, he was also the most kindly, tolerant, appreciative student of the mother country and the mother nation. And this was discerned in Britain in his own lifetime, by such far-visioned men as Jeffrey, of the Edinburgh *Review*. Jeffrey, famous for his immediate recognition of the greatness of the unknown boy poet Keats; famous for his uncanny discernment of the personality of Scott in the anonymous *Waverley Novels*; famous as the master of Macaulay and the great original source of a thousand lesser thinkers and critics, greeted Irving as cordially in print as Scott greeted him personally at Abbotsford.

The sentiments which Irving expressed, which won such response from Jeffrey and other large-minded men, today seem strikingly contemporaneous in tone, and show why it may be feasible some day to give shape and form to an Anglo-American understanding in an Irving statue.

The influence of Irving, realized or unrealized, rests upon every American visiting London, and upon every American thinking about London. He had the receptive audience of all America in its youthful day, and he had the power to charm. It was of historic significance that he told his receptive audience good and worthy things of their British kinsmen, that he used his spell to attract and not to alienate American sentiment on English themes. In his own age this won appreciation as cordial as his appreciation of the finer English things. For his *Sketch Book* sketches, written for American readers and published first in America, were reprinted in the stately columns of the London *Literary Gazette*. When through the influence of Scott a London edition was brought out, Irving was established as an author of the whole English-speaking world. The records of his life abound in testimonies and tributes received from Moore and Byron, from Lockhart and Mrs. Siddons, from scholars and historians, honors from societies and a degree from Oxford University.

The American who thinks of Westminster Abbey thinks of Washington Irving's Abbey, whether he has ever studied *The Sketch Book* or not. All later travelers and American guidebooks have felt the softened Gothic charm of his antique rhetorical style, so suited to the solemnity of that eternal monastery.

The ordinary rushing traveler cannot saunter or loiter or wander, by day or night, as Irving did, about the Abbey, through the corridors of a thousand years. But there is something of Irving in his thoughts and expectations, whether he knows it or not. It may be the vivid memory of a lover of Irving. It may be a random unconscious inheritance, like a phrase of Shakespeare in the patter of a pugilist. And if one has had the early fortune to meet and to know Irving, and to see how in his writing London is filled with wonder like Sleepy Hollow itself, all the metropolis recalls Irving, as in other moments it recalls Dickens or Defoe or Johnson to their devoted readers.

Now we come to a statement which seems in contrast with what we have said. Though Irving wrote of London, and wrote so charmingly, he seems as little known to the ordinary present-day Londoner as the first foreign author to mention the town—Tacitus of Rome. Though the great Jordan reprinted the individual articles of *The Sketch Book* and the great Murray published the English edition of the complete work, and several of Irving's later works had their first publication in England, the writings of Irving are not easily found in London stores. One American visitor, wishing to refresh himself by reading Irving "On London" in Irving's London, went forth blithely to purchase a new copy of *The Sketch Book*. He did not succeed. He made as many twists and turns of travel as Irving relates of himself in trying to find The Boar's Head Tavern. In one store he was offered an elaborate illustrated edition of the series of articles on "Christmas" found in *The Sketch Book*. It was only when he had wandered far out among the secondhand bookshops on Charing

Westminster Abbey.

Cross Road, and had inquired and searched diligently like a prophet of old, that he came upon an American edition, and went on his way rejoicing and marveling.

Perhaps more than one traveler who has read Irving has had some disappointment in not finding Irving's enchanted London. For even Londoners love illusion in their vast capital.

There was Dr. Samuel Johnson, who, as Macaulay said, "did not believe in the earthquake at Lisbon, but believed in the Cock Lane Ghost." Dr. Samuel Johnson, after spending a happy hour reading of the pranks of Prince Hal and Falstaff in The Boar's Head Tavern, Eastcheap, in Shakespeare's *Henry IV*, determined to go down to that tavern. He went, and told with vast delight of sitting in the very chair where once Prince Henry sat, and in the place of Falstaff! The great joy of a great illusion! The Boar's Head Tavern in which Johnson sat was a later structure, built to replace the original which was destroyed in the Great Fire of 1666. Dr. Johnson sat in a tavern two hundred years younger than the youth of Prince Hal, a tavern which was christened half a century after Shakespeare's funeral. It was almost with a note of lamentation that Irving came to write, a generation after Johnson, that the whole Boar's Head series of episodes in Shakespeare are fiction and myth.

"So vividly and naturally are these scenes of humor depicted," he writes, "and with such force and consistency are the characters sustained, that they become mingled up in the mind with the facts and personages of real life. To few readers does it occur that these are all ideal creations of a poet's brain, and that, in truth, no such knot of merry roysters ever enlivened the dull neighborhood of Eastcheap."

*Pilgrimage in Search of the Boar's Head*

It was in spite of this, he said, that he, "loving to give himself up to the illusions of poetry," determined to "make a pilgrimage to Eastcheap, and see if the old Boar's Head Tavern still exists." No one can estimate how many Americans, reading Irving's *Sketch Book* or guidebooks tinctured with *The Sketch Book* pigments, have made a "pilgrimage to Eastcheap." This one traveler, at least, made that pilgrimage, the same who had first sought after Irving until he found him in a secondhand bookshop. He did not hope to find The Boar's Head, after Irving could not, but he hoped at least he might see something of what Irving saw.

But he found, not only that the old Boar's Head Tavern had vanished in the Great Fire, and that the new tavern had likewise gone before Irving ventured thither—but even that portion of Eastcheap no longer exists. Verily there was once a Boar's Head Tavern in Eastcheap. Nothing remains of it save the carved boar's head which now rests among the museum memorials in the Guildhall of the city. There was a tavern which Johnson visited, where Goldsmith did some writing, where William Pitt and other famous men at times ate and drank in honor of Shakespeare and Falstaff and Prince Hal. There had been an earlier Boar's Head, reaching back to Shakespeare's time when that part of Eastcheap was full of taverns and the taverns were full of Elizabethan poets. But when one looks to find what Irving found, at least the site of The Boar's Head, he is shown the monument to the Sailor King William the Fourth, as somewhat near the spot where Falstaff sought oblivion and Johnson found illusion.

Ann Hathaway's Cottage, Stratford-on-Avon.

Eastcheap in Irving's time had changed from the Eastcheap of the old poets, where, as Lydgate sang,

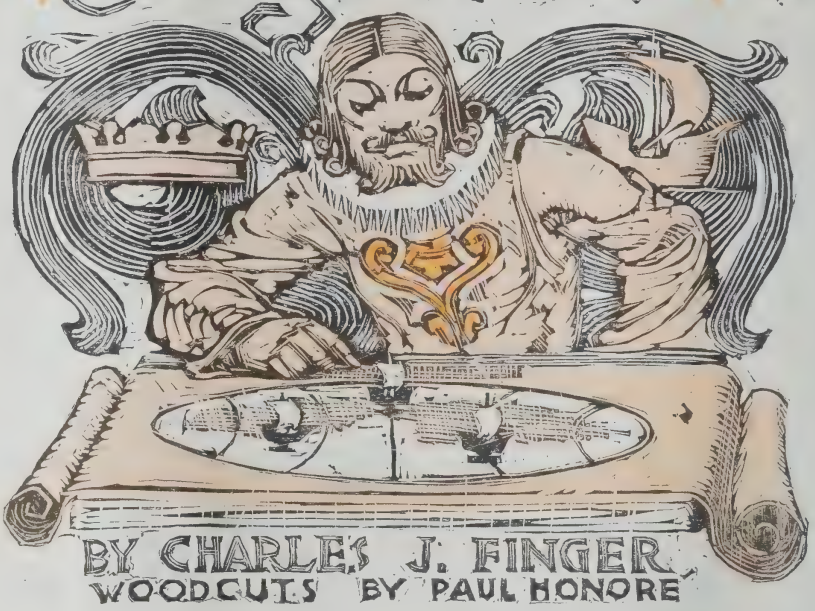
"One cryed ribbes of beefe, and mony a pye,
Pewter pottes they clattered on a heape."

But Irving, who complained that "the madcap royster has given place to the plodding tradesman," could at least find the homes of these plodding tradesmen above or about the shops. Directly across from the site of the Boar's Head he found a "tallow-chandler's widow," seated in her little back parlor and looking out upon her rear garden. The back parlor and the garden cannot be found in that present Eastcheap, where space is priceless—they would be as much out of place as tallow candles in one of the present-day counting rooms.

In going to Eastcheap, Irving tells us of pausing in Little Britain. Later in *The Sketch Book* he describes Little Britain in a rambling essay ascribed to a resident. One who visits today the region which he mentions, near Christ Church School, Bartholomew's Hospital, Smithfield, Aldersgate street, and Bull-and-Mouth street, now no more, can find only a portion of the streets he names, and none of the personages of the essay, nor the descendants of them.

The chronicles of Little Britain, as set down by Irving, lead one to parallel his own words on Shakespeare's Boar's Head episodes:

"So vividly and naturally are these scenes of humor depicted, and with such force and consistency are the characters sustained, that they become mingled up in the mind with the facts and personages of real life."



One can imagine that out of one window he will descry peering the gaunt ominous visage of Skryme the apothecary, "with a brown circle around each eye, like a pair of horn spectacles." He looks also for the rival of Skryme as the oracle of wisdom, the retired cheesemaker, who "lives in a fragment of one of the old family mansions."

In Irving's own record one can see, by the faithfulness of his chronicle, the shadow of the coming change. The most charming episode in his sketch of Little Britain is his story of the Lamb family, the household of the retired butcher and their advance in style, with the rivalry of the Trotter family, and the laggard imitation of the Lamb girls' French bonnets and other innovations by the young ladies of the region. The fortunes made today in Little Britain, the wealth of holders of property or retired merchants in that vicinity, might well mean baronetcies and baronies. Perhaps today the descendants of Lambs and Trotters sit in the House of Lords.

*Reflections in the Old Temple Church*

One who follows over London the paths marked by Irving's record of himself can find his way to the Temple Church, and there behold the tombs of the returned Crusaders. He can go out into the Temple Garden, but will be no more likely to see nursemaids of the type Irving saw, than to see the convivial Dr. Johnson fiery in argument, or the attentive Boswell, busily noting the master's words. If he visits the Charterhouse, he will be told that the clients of the place no longer reside there, though the institution is maintained, and the bounty of the ancient founder continues to protect old men in their helpless years.

# The Voyage of the Victoria

BY CHARLES J. FINGER
WOODCUTS BY PAUL HONORE

## Light on the Dark Ages

*First of a Series*

ONE of the great adventures of history, Magellan's voyage, was as great as that of old Hiuen-Tsaing, or of the Vikings, or of Ludovico Varthema, or of Scott who died in the Antarctic. As a boy the tale of it fired me, so much so that before I gained the year supposed to mark manhood, I was planning to follow his course. That, in part, I did later, following four hundred years or so in his wake, going ashore at his anchorages, living awhile on the island which he made his base in the straits, sailing where the ship that deserted his fleet went, riding inland at the place where he marooned two men, always re-creating in imagination the scenes and happenings.

But reading books written about him by well-meaning but misinformed men who knew nothing of the actual conditions in the straits and elsewhere, and noting what has been taught children in schools, I find I have a desire to write something about the man and his work with a wish to do my share in clearing up a few inaccuracies and misunderstandings. For instance, I quote this from a school history: "Portugal sent Amerigo Vespucci to make further explorations (1501). He followed the coast of South America till Antarctic ice drove him back."

It struck me as being strange that the explorer could have coasted so far south, evidently to Tierra del Fuego, without having seen the straits; for, being stopped by ice, he had presumably long passed the latitude of the opening, and coasting could not have missed it. In another juvenile history I find it said that the men with Columbus feared the coming to the edge of the world and a place where the ships would drop over into nothingness, which seemed to betoken an adventurous spirit that bordered on suicidal insanity and did not at all square with another assurance a few pages before, that the knowledge of the sphericity of the earth had been attained through the Moors.

Perhaps of all those misconceptions the most mischievous is that which sees men of bygone ages as being steeped in ignorance, to the point of being unaware that the earth was a globe. For it must surely be obvious that there were sailors enough, intelligent though unlearned, who had seen the circular visible horizon and its dip at sea, not to mention the phenomenon of hull-down ships outward bound. Yet, somehow, there is in all of us a curious and illusory sensation by which sometimes we get glimpses of a wealth of knowledge in the past and so sit humbly at the feet of past generations with a kind of Confucian admiration, as when we learn of excavations in Babylon or the discoveries of antiquarians in Central America. But at other times we are inclined to look upon ourselves as sitting superior, heirs of the ages high-lifted, regarding all who went before us as utter barbarians; as for instance when we read of Samuel Pepys the public servant learning his multiplication table at the age of thirty; or as when we think of men of the Ice Age, quite forgetting that although they lived thirty thousand years ago, according to the scientists, they had domestic animals, used utensils, sewed skins, drew animals on the walls of caves in a way far more spirited and accurate than many of us can do today.

The truth is that we have a kind of shifting viewpoint, like that of a man in a boat on a wave-swept sea, now in the depths with overtopping waters all about, a moment later on the crests with an extended horizon. More rarely we get a higher and saner viewpoint, the viewpoint of emergence and submergence.

Still more rarely we realize that it is hardly possible to say with safety that a certain people were thus and so at a given time, seeing that there were planes and planes, ignorance here and knowledge there, side by side, refinement touching boorishness, poverty eyeing wealth, judgment rubbing elbows with stupidity, business men keen and alert close to the thriftless, and that it has been so down the ages.

Under the Saracen leader, Kalif Al-Mamun (813-832), the dimensions of the earth had been ascertained, the length of the year had been calculated and correct astronomical data had been obtained. That meant much for the mariner. In every city in the lands bordering the Mediterranean the productions of Arabic literature were copied, collected and translated, and everywhere in the Saracen world were colleges. We have that on the authority of Gibbon.

Just as posterity might turn to a presidential proclamation for evidence of contemporary ideals, so we can turn for evidence of cultural ambition to the order of Al-Amun which ran in part thus: "They are the elect of God, his best and most useful servants, whose lives are devoted to the improvement of their rational faculties; that the teachers of wisdom are the true luminaries and legislators of the world, which without their aid would again sink into ignorance and barbarism." This then is some slight indication of the nature of the foundation upon which the Spanish and Portuguese civilization was built. And from that time, up to and long past the days of Magellan, those were days of emergence, not submergence.

Running parallel with all that

effort to attain, there was admittedly illiteracy, ignorance, credulity and apathy. Wild and extraordinary beliefs were held, and men distorted the stories of explorers, for sensationalism is no new thing. For instance some held that what was unmistakably Paradise had been discovered in India; some that the Wandering Jew walked the earth; some that alchemists had power to turn lead into gold and to rejuvenate the old; some that in parts of the earth were bright-colored sheep, giant birds called rocs able to carry off an elephant in one claw and a hippopotamus in the other. As to this last, there have been guesses that one meant the guanaco of Patagonia, the other the condor, as described by unknown adventurers, but the guess is too far-fetched.

There were traditions, very old and a little puzzling, about a vast continent in the western sea. There was Strabo who had said that the only hindrance in the way of passing from Iberia (Spain) to India was the vastness of the ocean, and he went on to hint at two countries that ran north and south. Then Bembo, in his *History of Venice* (vii, p. 257), told of a French ship once that met with a boatload of strange men (Indians) not far from the English coast, who had apparently come from the western lands. Fact was all mixed with fiction, though there were careful minds which separated one from the other.

Stepping into the life commercial we find immense activity of a kind unsuspected by the average man who has not looked into the matter and who conjures up a picture of petty trading in ramshackle booths, or of merchants going about with baskets and bundles. But there were, in fact, merchant princes very enlightened and very enterprising, like that man of Augsburg, Conrad Roth, who came very near to monopolizing the pepper trade, who established regular shipping service between the Elbe and Lisbon, who as a necessary side line turned to the formation of a postal service between Italy, Germany, France, Spain and Portugal. He died in 1579. Then there was the House of Fugger, also of Augsburg, so wealthy, so well organized, so keen for advantage, that it was able to lend and lose without a whimper eight million ducats to the Hapsburgs and to the Spanish kings. It had agents and correspondents all over the known world who forwarded full reports of events to headquarters to the end that proper policies might be adopted and profit made. It is reasonable to suppose that the mysterious Thomas Tison, who lived somewhere in South America about 1526, was some such agent of a similar house.

The Fugger News-Letters, vastly interesting and important documents, the originals of which are in the Vienna National Library, contain a tremendous amount of history and present a vivid picture of the time. And if ever the reports made for and to the De Haros, another commercial house, are found, light will be shed on much that is now dark and at which we must shrewdly guess. For the De Haros were Antwerp traders dealing in spices and peppers and costly woods and gold dust, their trading points everywhere and anywhere, their ships leaving on unknown missions, their executives men of high training and strict methodical action whose devotion to duty was sincere and who worked patiently for real and enduring results. It is important to know that, when the proper time came, the De Haros gave financial support to Magellan and bore at least a fifth part of the cost of the entire expedition.

We see then a powerful commercial house with an elaborate organization and all kinds of knowledge at its command, full of a spirit of initiative, with intelligent eyes and ears everywhere, its mental forces marshaled, as it were, its leaders men of efficiency, its whole aim the development of trade in new lands; exploitation if you will. Everywhere connected with that house was discipline, everywhere were men of remarkably broad views and sound loyalty. But at the courts, both Spanish and Portuguese, there was a different atmosphere. There were men with ulterior motives, men petty and jealous aiming at their own narrow advantages, men given to befogging issues with long speeches, objections and precedents, overbearing churchmen, subtle sycophants, courtiers grotesque and ridiculous, a royal master surrounded with flatterers.

Ships of the House of De Haro on trade explorations had found the strait and Schoner made his map from information furnished by the mariners themselves.

Apparently two active groups had to do with Magellan, one of these with a clear-cut policy, the other with no policy at all. One with knowledge and information, the other without. One a commercial machine acting as a unit, the other a loose aggregation of individuals separated by jealousy and suspicion. Suppose there was previous knowledge of the existence of a strait leading to the Pacific, which of the groups would be most likely to have the information? Which would be more

eager to forward matters? Certainly in considering world affairs it does not do to overlook the dominant influence of commerce.

As to the question of knowledge of a strait let it be said that when finally the royal permission was given for the expedition, the purpose was set forth in these words: *para buscar el estrecho*, that is, *to search for the strait*—not to see if there was a strait, but, it would seem, to hunt for a strait the existence of which was already known. Still, to hang so much on so small a peg, a word that well might be a pen slip or the error of a clerk, would be silly were it not for other circumstances. And these are the circumstances in brief:

First, consider Prince Henry the Navigator, issue of the marriage of King John of Portugal and daughter of John of Gaunt. In his youth he studied navigation while living austerely in his castle near Cape St. Vincent; then there were activities, voyages, discoveries, the founding of the slave trade and the furnishing of free labor in the mines and plantations of the conquistadores.

In 1419 Prince Henry discovered Porto Santo by accident, his ship being forced to run before a gale. The discovery of Madeira then came as a matter of course. How far he went, what seas he sailed is not known. But there is an interesting passage written years later by one Antonio Galvao, in his *Tratado* which runs:

"In the yeere 1428, it is written that Don Peter, the king of Portugal's eldest sonne (brother to Prince Henry), was a great traveller. He went into England, France, Almaine, and from thence into the Holy Land, and to other places; and came home by Italie, taking Rome and Venice in his way; from whence he brought a map of the world which had all the parts of the world and earth described. The Streight of Magellan was called in it the Dragon's Taile." (This would indicate that the existence of South America was known at least 64 years before the voyage of Columbus.)

Second, there is the case of Schoner and his maps. Schoner was professor of mathematics in Nuremburg, in 1515. As may be seen by the copy of the map made that year and another made later, but very much like the first, his outline of South America is fairly correct, with that correctness which a map-maker might attain working from a description, or from a rough chart furnished by some uneducated navigator. There is a strait shown, not flung in at random by any means, but situated approximately about latitude 45 degrees, or nearly seven degrees north of the correct position. If Schoner guessed, he made a most remarkably lucky shot, getting not one, but two bull's-eyes, for, almost in the correct position to the east of the straits is shown a group of islands, clearly corresponding to the Falklands, but which, according to history, were not discovered until 1592.

Again, turning to the Ruysch map of the world, made in 1507, there may be seen a notation written across that part marked as Santa Cruz Land, to the effect that Portuguese ships had sailed as far south as latitude 50 degrees. Add to that the fact that the curious gentleman who came out of Italy, to sail as passenger with the Magellan expedition, has this in his notebook:

"The captain knew that he had to navigate through a very well-concealed strait, having seen it in a chart preserved in the treasury of the King of Portugal and made by Martin of Bohemia, a man of parts great."

The southern extremity of South America, showing the Strait of Magellan, said to have been notated as the "Dragon's Taile" by Prince Henry of Portugal 64 years before Columbus discovered America.

Finally, not to make too long a tale of the matter, there is an old German pamphlet, a translation made from the Portuguese about 1514, which is the record of a voyage made by the writer, "a strong friend of his captain." It was an expedition financed by several merchants, a Christoffel de Haro one of them, and, in the course of the voyage the mariners found a strait going from east to west, "Mallaque not being far distant."

If that was not the passage between Patagonia and Tierra del Fuego, what was it?

What seems probable is this: The House of De Haro was active in trade extension. Their ships were everywhere, in parts known and unknown. On one of those trade explorations the strait had been found and reported to Christoffel De Haro, and Schoner made his map from information received from the mariners themselves. The De Haros kept the information and their counsel, seeing a possible way to the Spice Islands, with a strong probability that new lands would be discovered, meanwhile waiting proper opportunity to fit out a stronger expedition with a strong man to command it. Opportunity presented itself when political conditions were right for action. The Magellan expedition had the appearance of a government affair, but the real springs of action were hidden in commercialism, and royalty, and those about the royal figure were much as pawns in the hands of astute men who knew what they wanted and the easiest way to get it.

As for the argument of the improbability of a lone ship making so daring a voyage to the far south when an organized fleet experienced such difficulty, that is weak. Both the fury of the southern seas as well as the danger of the straits has been exaggerated. The Vikings did many daring things. Or take the case of the buccaneer, Captain Sharp, who tried to find the Magellan Straits from the west and rounded Cape Horn in a rough season all unknowing that there was any such way into the Atlantic. Or, what of Captain Slocum who sailed down the Atlantic Coast alone in his sloop, the *Spray?* For the matter of that, I, with two companions, coasted south from Bahia Blanca and through the straits in a cutter, nor was the feat in any way memorable, and only exciting long later, when we were wrecked off the coast of Tierra del Fuego, our craft being light of cargo at the time.

# Where the Buffalo Survives

SOME transcontinental trains serve prime buffalo steaks and roasts on their dining cars, the buffalo being taken from private herds supported by the railroad serving the meat. On October 17, 1909, thirty-seven head of buffalo were turned upon the range established by a railroad near Ravalli, Montana, and today the herd numbers five hundred. Each year it is necessary to dispose of a number of the animals in order to keep the herd within the food capacity of the reserve. There are six nationally owned buffalo herds in the United States. The two largest are in Yellowstone National Park and the Montana National Bison range. The Canadian herd, located in the Wainwright National Park, is reported to contain 10,000 head.

Sixty years ago the Indians of the West subsisted mainly upon the buffalo and as long as the supply held out they were able to defy the white men. The flesh was excellent food, and when sun-dried would last for a long time. The hides were used for lodge material, winter clothing, harness, boats (in the form of the Missouri River coracles), shields and various other necessities. Different uses were found for the bones and horns. The sinews were used for thread by the Indian women. At no time did the Indian kill buffalo merely for the love of killing. It is true that in the later stage of the buffalo the white traders encouraged the Indians to kill indiscriminately and as the buffalo hide became a valuable commodity the slaughter increased. From 1860 on an army of white hide hunters, with the aid of their Indian allies, followed the herds and killed so many that careful estimates indicate that on the average 2,000,000 hides a year were sent to market between the years 1865 and 1875. The hides were stacked like cordwood on the banks of the Missouri waiting for the fleet of steamers to take them down to St. Louis to market. The price per hide was $1.00.

The hides for the most part were made into robes, although a poor grade of leather was also made. The "wool" was spun and made into cloth for gloves but this industry did not long survive.

# The Gorilla at Home

## This Anthropoid, Usually Very Peaceable, Is Much Maligned

By C. R. ASCHEMEIER

IN THE early part of 1916 I was asked to accompany Professor R. L. Garner—better known as the "monkey man"—to the French Congo, to procure a collection of natural history specimens for the Smithsonian Institution, particularly the anthropoid apes occurring in that locality, namely, the gorilla and the chimpanzee. After much delay, we left New York City on December 18, 1916, bound first for Bordeaux, France, where we made a month's stay, finally sailing on the French steamer *Afrique*, since wrecked in the treacherous Bay of Biscay with five hundred persons aboard. In due course we reached Dakar, Senegal, our first stop on the coast of Africa, docking at sunset, just as many of the Senegalese, who are Mohammedans, were at prayers with their faces toward Mecca. Their flowing robes of many colors made a very vivid picture.

At Cape Lopez a few trading posts and the natives of a village were all that welcomed us. I had imagined that I would see gorillas on the spot, but it was quite a while before I saw any—in fact not until we had gone up a river from Cape Lopez to Lake N'Kami. My very first one was a youngster, captured in the bush by natives who had killed the mother. It tried hard to get away, but did not scratch or bite.

While in the French Congo I saw gorillas in nearly every kind of country—on the plain (though close to the bush); in hilly and in marshy country; in trees and in the deep bush, in short, everywhere but on an island where I saw chimpanzees. However, gorillas seemed to like the deep jungle.

I had my first view of a full-grown gorilla a while later, when I was on the plains looking for buffalo or some other animal that might replenish our larder. I saw what first looked like a human footprint, but my guide said: "N'gina"—meaning gorilla—and I was thrilled with the thought that I might see a full-grown ape. In pidgin English my guide told me to follow him cautiously because, as he said, the beast had just passed. The print was at least twelve inches long, and, as I was wearing a number seven shoe, my foot was entirely lost in it.

Upon coming around an edge of the bush, we were rewarded by a view of a magnificent, full-grown gorilla, sitting on a limb in a medium-sized tree. It did not appear to mind us at first, and I stood for about two minutes looking at it—which is a very long time for a gorilla to remain still after seeing anything, especially a human being. But when it moved it did so very quickly, using its immense arms to great advantage, and soon disappeared.

While I came across many gorillas in my wanderings in the bush, a few encounters and "brushes" with them stand out more prominently than others, and it was while stopping with Chief Edembi, that I had the good fortune to have dealings with a large family group of gorillas. We were at the chief's village on Lake Ngovi, and in the early morning, while eating "chop," a native came across the lake to tell Chief Edembi that the "N'gina" were ruining his plantation of bananas and plantains, and would "white man please come for shoot him."

The author modeling a bust of a gorilla. To the right is shown one of the large specimens collected by Mr. Aschemeier on his journey in Africa.

I needed no second invitation; and calling my faithful guide and helper, Pambo, I started for the place in a canoe accompanied by two other natives, making as much speed as possible. Upon arriving, Pambo and I hurried along until we came to several plantain stalks which the gorillas had pulled over. At first this seemed to be only wanton destruction, but we found that the animals had apparently been looking for the right-flavored ones, as the inner part of some were pulled out and eaten. We thought our quarry had escaped; but upon glancing toward some tall trees on the edge of the plantation, Pambo exclaimed:

"He live for tree!"

Sure enough, two of them were just climbing up a thick vine hanging from the top of a large tree, and cautiously we made our way toward them. By careful maneuvering we got nearly to the foot of the tree, watching them intently all the while. I counted eight in one tree which appeared to be eating something, and fortunately their backs were turned to us.

I consulted with Pambo as to which one to fire upon; and while we were whispering and pointing, two or three animals on the ground which we had not noticed gave a warning cry. Action was the word! Down the vine the gorillas started. I fired, and brought down a fine male specimen, while on the others came, hand-over-hand fashion, at least twenty-five in all.

For a long time I stood there, studying this mighty beast of sinew and muscle which I had killed, fully realizing that it could, with little effort, have torn me limb from limb when alive.

It was late when we got back to the village. Edembi was much pleased to know that I had procured an "N'gina" to be "put in the house"—meaning the museum. I tied a tent fly about the gorilla, also a bell, as leopards were prowling around the village at night. The bell rang several times during the night, scaring off the leopards. At daybreak the next morning I measured the beast, skinned it, and preserved the skeleton, which I tied high up on a bamboo pole that night on account of the leopards, which would not be denied, however, and badly mutilated one of the shoulder blades by leaping upon the skeleton from the ground. During my two months stay at Anguanamo the leopards killed fifteen natives and wounded three.

Finally I bade goodby to Edembi, and started for Ogouma, which was several days by canoe. On the way my helmet blew off, and as I backed the large canoe to recover it, some clay, which had been packed in the stern to stop a big hole, washed out, and for the next twenty minutes the paramount issue was speed, both in bailing and in paddling the canoe to shore. The water was very rough; and had we gone a half-mile farther we would all have been lost, as the lake widened out to nearly four miles at its widest part. We sank, but luckily in shallow water.

Arriving at Ogouma after an exciting trip, we put up in an old bamboo house, formerly used as a trading post by an Englishman. Ogouma was the scene of many a stirring gorilla hunt.

At Ogouma the Rembo N'Kami is very narrow, and on hearing a commotion on the opposite bank, Pambo, another native and I crossed in a canoe to investigate. The noise had ceased by the time we reached the other side, and Pambo suggested that they should scout around while I waited for them at the meeting of two trails. After a long wait I heard a shot; and after a short while I heard another. Of course, I believed that the second shot meant that the quarry was ours, but such, however, was not the case. Presently both natives came running. Pambo said he had shot one gorilla while in the midst of about twenty of them, and that "dey done live for come katch him." Both of them looked it, as their loin cloths had been torn by the bush as well as their bodies.

Professor Garner suggested that I make a trip up to Eschira by a trail which had been used by no less a personage than Paul du Chaillu, the discoverer of the gorilla. It is, however, claimed by some that the gorilla was first seen by Andrew Battel, an Englishman, during his wanderings in the bush after escaping from his Portuguese captors.

So, leaving Ogouma with a small group of carriers, we reached Kruso, the first town in Eschira, where we put up for the night. Presently a native came to my hut and asked me to come and talk to his chief, and, as I spoke both pidgin and N'Kami, I readily assented.

I was conducted to the hut of the chief, a very old man, lying on a native mat beside a smoking fire. After wishing me "M'bolo" (Good day, Sir), he asked me what had become of Du Chaillu. He said he had accompanied the latter on some of his hunts while a boy; that they had called him "Paully," and that Du Chaillu had shot a gorilla not far from the town. The chief also said that the famous explorer was a fearless man.

Resuming our march the next day, we reached the St. Croix Mission, and were very hospitably received by Pére Remey, a French Catholic priest. The priest was quite a hunter himself, and, having been in the country a long time, he had had many exciting encounters with gorillas. The mission overlooked a large plain, and in the distance loomed a lofty mountain; but my stay was cut to one week, as a native arrived with a note from Professor Garner, begging me to return at once as he was very ill and had to go to a hospital on the coast. So I bade Pére Remey farewell, and made Kruso in the middle of the night. At daybreak I was again on the way, leaving the carriers to bring up the rear. Rain fell unceasingly for a day and a night; and after crawling on a log across a swollen stream, I made a safe landing.

The next day was Sunday. We were in need of meat, and a native came in to say that he had seen an antelope not far off in the bush. I at once took my gun and followed him. Penetrating a thick growth of bush, I saw the outlines of a beautiful antelope, and, taking aim, I brought it down. Returning to the house, I sent some boys to bring it in. While preparing this antelope, we heard a great commotion across the river, which at first sounded like wild hogs. But suddenly a terrific gorilla-yell split the air, and it seemed as if the pigs and the gorillas were disputing the right to be found together on the same place in that bush.

I gave Pambo a gun, and sent him to investigate. One boy accompanied him. I was busy with the antelope when I heard a shot, a roar, another shot and another roar; then a third shot—and silence.

A little after dark Pambo and his companion came in, the former saying he had shot a gorilla. He had broken the animal's arm with the first shot; it had tried to get at him while thus disabled; the second shot had slowed it up, and the third had finished it. The boys had tied it to two stout poles, but it had proved too heavy for them to bring in unaided. So, taking a lantern, I set out with seven boys. For a time we were lost and had to wade in water up to our necks; but finally we located the gorilla and carried him to the canoe; but it was a task even for seven boys to carry the huge beast.

Ill as Professor Garner was, he managed to get down to the beach to look at the animal, pronouncing it to be a very fine specimen. This particular gorilla is now mounted and on exhibition in the United States National Museum; it has a reach of eight feet, is over five feet three in height, and weighed in the neighborhood of three hundred and fifty pounds.

One of the most frequent questions asked me in regard to the gorilla is whether they carry off natives, especially women, into the bush. There is absolutely no truth in this story, and whenever I inquired in regard to it, the natives of the gorilla country always answered in the negative, accompanied by a laugh.

An interesting thing about the gorilla is its partiality for porcupine meat. Not only did I learn this from the natives, but I personally noticed that the feces of the animals often contained porcupine quills. Fruit also constitutes part of the gorillas' food; I have often seen them in trees eating fruit of different kinds.

The gorilla is among the least-known animals, and very little has been learned of its habits. As a rule, they generally see the hunter first, and do not stop for a "conversation."

The fierceness of the gorilla has been greatly exaggerated. It will retreat in most cases when it has a chance, and only when cornered or wounded will it put up a fight; it has some "notches" to its credit, where the hunter has come out second best. Several natives showed me what the gorilla had done to them—one woman's face had been badly mutilated as a gorilla had knocked her unconscious by a single blow from his ponderous hand, and another native had had the calf of his leg horribly mangled by the animal.

But when one is getting evidence from natives, it is always best to have proof before making assertions; were one to believe all the stories told of the gorilla, the beast would be a monster, indeed.

The gorilla is, of course, protected to a certain extent, but ought to be protected to the letter, or it will soon become extinct. While some natives do not partake of its flesh, others are, however, very fond of it. I discouraged this practice all that I could, and by the time I left the country many had given it up. But for how long I could not say, though I sincerely trust it was permanent.

Such hunters as go to West Africa for sport generally leave the gorilla alone; but the over-ambitious scientific collector must be curbed, or the animal will soon be exterminated. Personally, I collected but three—for a group—together with nine chimpanzees; but the latter are much more plentiful, and, of course, I could have taken a great many more of both.

# Uncle Sam Smashes Dishes to Study Them

By GEORGE H. DACY

THE dish juggling and dish smashing stunts of slapstick comedy have been duplicated latterly in Uncle Sam's scientific shops at Washington where national experimenters have broken 6,000 dishes and 8,000 samples of table glassware, plate and window glass in order to study them.

These extraordinary tests have proved that made-in-America china and glassware are more durable than the best of imported goods. The largest restaurants and hotels report that they lose one dish out of every five by breakage each year. One Chicago hostelry reports a $50,000 dish breakage bill annually. Many millions of dollars' worth of plates, cups, glasses and saucers are shattered because of fragility of imported chinaware.

The Washington strength tests in the national laboratories have proved American dishes and glassware to be the best. At present, eight of the leading hotels in this country are conducting service tests of American and imported crockery and glassware. Experts say that these worthiness investigations will also demonstrate the superiority of our domestic goods.

An iron ball attached to a pendulum was allowed to fall different distances and strike the various specimens of crockery and glassware in these novel strength trials. In each case, tab was kept on the weight of the ball and the length of the arc through which it was swung. Tests in which glass tumblers were exposed to sterilization temperatures and boiling water have proved that machine-made glasses which cost one-half as much are as durable as handmade specimens.

All kinds of structural glass have been tested in mammoth tryout machines which are capable of exerting a pressure of as much as 100,000 pounds. Gravity shot towers have also been used in developing stress and strain in the glass samples. Severe water pressure has been harnessed to duplicate the wild forces which wind and storm use to buffet against plate-glass windows in stores and private homes. Never before in the history of glass manufacture has so much valuable material been destroyed in order to solve all its secrets. The results will revolutionize certain phases of the dishware industry.

# Chats with Office Callers

"Speaking of the sale of National Cash Register stock," said ***The Business Expert from New York,*** as he dropped into The Office, "I suppose you remember the stories that used to be current about the National's methods of stamping out competition. Well, most of them were true. The early days of Standard Oil had nothing to teach the National about getting rid of competition. I knew Mr. Patterson very well, and ordinarily he could be described as a wise man, but he was never business man enough to put the right value on his competitor-busting methods. It was extremely costly; it was extremely un-American; it was extremely unbusinesslike, but I am sure that John H. never saw it that way. The irony of it all was that the National never triumphed over its competitors in the way John H. Patterson thought it did. It won its triumphs in its invention department. They were always making a better and more serviceable cash register. They were always putting more value into it—more ideas—more usefulness. And that was what won. It was not the competitor-busting that won. If the invention department had not kept making a better cash register all the time, the activities of the competitor-busting department would have ruined the business. But John H. never saw that."

❦ ❦ ❦

***The Midwestern Clergyman*** came into The Office:

"The wide-open Continental Sunday," said he, "is foreign to the American Spirit.

"It is an importation, an adaptation and it will not thrive.

"Bishop Manning, a short time ago, startled the Church world by advocating a wide-open Sunday. Clergymen from all over America came back, some with condemnations, some with approval, and some offering halfway agreements with the Bishop.

"I watched the progress of this discussion and it seems that the consensus of opinion boils down to these five general agreements:

"First: That the United States does not want the wide-open Continental Sunday.

"Second: That most Clergymen feel that it is no more harmful for a poor man to play on Sunday than it is for a rich man—and most rich men whom I know play all day Sunday. How is it with you in Detroit?

"Third: That wholesome play is not harmful nor irreligious on the Sabbath.

"Fourth: That commercialized play is a bad thing on Sunday; that it keeps men from doing the very thing that the Sabbath was instituted for; that of getting recreation themselves.

"Fifth: Most of the responses to Bishop Manning indicated that two-thirds of the preachers were willing that the whole matter should be tested by what Jesus said: which is that the Sabbath was made for man, not man for the Sabbath.

"In Hutchinson's *One Increasing Purpose*, there is a glimpse given of a happy, normal English home. I was deeply impressed with one incident. On Saturday night at eleven-thirty the dancing stopped among the young people. A visitor asked the beautiful daughter of the house why. She said: 'Oh, Father just doesn't like for us to go frolicking into Sunday you see.'

"Frolicking into Sunday. It's a good phrase that Mr. Hutchinson has given us.

"It about sums up what we think about it in the United States. We are old-fashioned enough not to like the business of 'frolicking into Sunday.'

"The business of 'frolicking into' and 'frolicking' through the Sabbath is a European importation which does not set well with our original American ways.

"Will the European change us? We shall see. There are a lot of him coming this way. Maybe there will be so many that even this old American tradition and prejudice against 'frolicking into Sunday' will go, along with a lot of other truly great American traditions.

"At least we ought to be aware that there is real danger of having the Continental Sunday substituted for our American Sabbath. I am told that most of the actors of America, including the Equity Association and the Vaudeville Organizations would prefer not to play on the Sabbath but Jewish theatrical owners compel them to play."

❦ ❦ ❦

"We have taken a turn for the better," said ***the Man from the Next Room*** who had been away from town. "There seems to be a scent of spring in the moral atmosphere. The people are 'rounding to,' showing that fads may come and fashions go, but blood tells. I detect a distinct return to normalcy, so to speak, in newspapers of the better type and in magazines. Of course we shall always have the opposite kind, but their power to influence the higher types has been definitely lost. The Menckens may stay with us, but they will descend more and more to the status of vaudevillians in intelligent esteem. All our critics who hailed a new era in the idiosyncracies of the irresponsible 'artists' of recent months are being definitely shelved. The old substantialities are coming back into favor, and those who refused to bow the knee to Baal are in the finest kind of position. Even the comic strips of our newspapers are beginning to show signs of returning decency and sense. Youth also is exhibiting its real quality and has cast aside the disguises under which it recently masqueraded; it has come through unscathed.

"And why should it not be so? Of what stock are we that we should go to pieces in a generation? Who are we that the ends of the world in moral collapse should come upon us? Was that to be the end of centuries of building on the part of our fathers? Hardly. There was always in our race the long, long reserve of moral endurance and resiliency. The very life in us is of such long and fine descent that it cannot be corrupted. The power of the good to stage a come-back is unparalleled. Nothing else can. The most dangerous loss of faith a man can sustain is to lose his faith in the unrivaled endurance of the morally good and the inevitable response of his race to it, when it calls deeply."

❦ ❦ ❦

"One thing that does not look well in America," ***said a Massachusetts Man,*** "is the prosperity-in-spots which is noticeable here. That means adversity-in-spots. Go through the South and the industrial opportunities are few, the agricultural opportunities numerous but hard. Go into New England and the factory chimneys are cold, the gates closed. They tell us that industry is shifting—cotton to the South, shoes to the Middle West. But it would seem that this great country has sufficient internal need to keep each district normally busy in supplying itself. All parts of the country should be busy and happy. Of course, in a sense, retribution has fallen upon New England. It never was able to see anything in industry but low wages and high dividends. This brought labor unions in, and in the fight between unfair unions and unfair bosses, industry was killed. Industry was always a means to a private end with its owners. And now 'Ichabod' has been written over the once leading industrial section of the country—'the glory has departed.' The most completely unionized part of the country is now deprived of industry. It need not have departed; it could have spread—had management been better and labor been fairer. Rule or ruin was the motto of both sides, and ruin threatens both."

❦ ❦ ❦

"I used to know old John Burroughs," said ***the Man from Virginia,*** "and it was an unceasing delight to watch his ways. The impression he made on me was one of insatiable curiosity. He wanted to know about everything. He quickly got through the superficial facts and came to the shore of mystery, in every simple thing. He found as much mystery in a chicken as in a man. It was rather amusing the way he would admit that an old hen baffled him. The first time I met the old philosopher-naturalist I was driving an air-cooled motor car—one of the old type. Mr. Burroughs noticed the difference in the shape of the thing and immediately began to ask questions. Then he made me lift the hood and describe the internal anatomy of the thing. It was not like an expert machinist asking questions, but an alert mind trying to find its way through the unfamiliar field of machinery. Once on the track he never let go. We went for a ride and crossed a bridge which ran above a railroad track. A freight train was coming. The smoke curled up through the interstices of the boards in the bridge. 'Stop!' said John Burroughs, 'I always count the freight cars.'

"I think that typifies the spirit of youth which he maintained so long—he always counted the freight cars."

# Will Palestine Ever Pay Its Board?

(*Concluded from page 13*)

came her people, their God should be her God. The Jews believed that when they were in Egypt Jehovah heard a language which He understood not, and they asked "How can we sing Jehovah's song in a strange land?" The god went with the land.

The disruption which followed Solomon's reign of glory found for the first time in the history of mankind two nations worshiping the same God. And later, when Palestine overflowed and swarmed, the Jews found that their religion was portable. In Babylon they devised the Synagogue, an institution not provided for in the Law of Moses, and, in spite of all the partially successful efforts of the authorities to centralize the Jewish religion, at Jerusalem, the local places of worship prevailed not only in Palestine but wherever there was a considerable number of Jews. The God of the Old Testament could be worshiped in any land. The *Book of Jonah*, is some noble soul's testimony to a faith that God had a right to be heard in Nineveh, and that Nineveh, which had already gone down to doom before this book was written, and had died in its gross polytheism, might have been saved to a nobler life if Israel had done its duty. The God of the Jews could be found anywhere. A Jew might take the wings of the morning and dwell in the uttermost parts of the sea and yet find God. That was a great and late discovery.

*A Wilderness That Will Not Blossom*

But while this faith had its important bearing on the continuity of the Jewish race or races, for they are by no means unmixed, it did not tend to give them a land; and cruel persecution has kept them sighing for a national home, which very few of them have cared to occupy! While Baron Rothschild was securing, with lavish gifts, an increase of 30,000 Jews in Palestine in 30 years, the Jews in the United States have increased in 40 years from about 200,000 to at least three million. There is not the slightest probability that the migration of Jews to Palestine will begin to be as great as it is to the United States. I know no reason why we should not be glad to see every Jew resident in Palestine who cares to go there especially if he will work when he gets there.

Palestine has no iron, no coal, no navigable streams, no harbors. It has a limited area of tillable soil. The Valley of Esdraelon, or Meggiddo, is as rich as the land in an American prairie. The Jews have bought great patches of it. They will till it somewhat better than the Arabs have done, but not very much better. That land is now cultivated and has been cultivated for thousands of years. If the Jews bring more scientific methods, as they probably will, they will somewhat increase the productivity of even the fertile portions of Palestine. And, if they draw water from the Sea of Galilee and the Jordan and irrigate land that is now sterile, as they propose to do, that will be almost net gain. But neither the Jews nor anyone else will till the wilderness of Judea, nor produce paying crops on the denuded hills of Ephraim. There will not be increase of fertility proportionate to the increase of population.

And under the best of conditions what can Palestine export?

There is available for export, barley, in limited quantities, olive oil, and oranges, and not a very great amount of any of these. Jaffa oranges still are good. I ate them instead of drinking water between meals, when I rode horseback through Palestine twenty-five years ago, and it was good to get back and find them still juicy and appetizing. But they grow oranges in Florida and in California as well as on the coast plain near Jaffa. Can Palestine ever export anything that will somewhat nearly even the balance of trade? Money is there now, but it is not money which was dug out of the soil either as ore or as a crop. Can Palestine ever support itself with a much greater population than it has at the present time?

Here is where the American tourist is misled. He is shown a number of thrifty Jewish colonies, some of which are bringing sterile land under cultivation. He is shown a fine flour mill and a large cement factory at Haifa. But he is not shown any crop product proportionate to the money expended. It is too soon to expect that, perhaps; very well, he is not shown any real promise that there can be increase proportionate to the money spent, and that money is given by rich Jews, who prefer to live in New York and not in Jerusalem. Furthermore, this tourist is not shown any smoke emerging from the smokestacks of the cement factory or the flour m ll, and the longer he stays the less smoke he is likely to see. Both those institutions are bankrupt. They cannot run without coal, and every pound of coal must be imported. It is cheaper to import the flour and the cement.

Cement—there are shiploads of it. The roads are white with its leakage. It means sanitary construction, rat-proof construction. It is to be commended. But that cement was made in Germany. It can be laid down on the dock in Haifa very much cheaper than Haifa can ever produce it. Not every American tourist learns this fact. He sees the cement factory and sees the new cement construction; they are strangers to each other. What can Palestine produce that will support and construct and transport? It has automobiles, but it has to import every pint of gasoline. It has factories but they cannot afford to operate. Its industrial future would seem to depend upon its sheep-raising, its vineyards, and a very limited agricultural development. There will be no reaction for a good while. Money now is flowing in and will continue to flow in quantities still larger. But if Palestine ever has to pay for its board on the plan of its present bill of fare, it will have a sorry reckoning.

The second "Station of the Cross" is situated in this quaint old street.

The most conspicuous monument of the recent Jewish ascendancy is the new Hebrew University in Jerusalem. Lord Balfour, who snatched Palestine away from its possessors to present it to a small minority of its inhabitants, thereby to please the Jews of Europe and America, was present at its dedication. The Moslems did not love him, but refrained in general from hostile demonstrations. Feeling, however, is deep and bitter. The people of Syria and Palestine had reason to expect that the pledges of Great Britain and France would be fulfilled and that the end of the War would give them independence. Instead, France gobbled Syria, and the result already is bitter and bloody. Britain, that did not want Palestine for herself, gave it, without herself owning it, to the Jews. Some people think that was a glorious act, and that it fulfilled prophecy and wrought justice. But a large majority of those who live in Palestine and whose interests are affected by this gesture, the Moslems and the Christians, view the whole performance with displeasure and deep misgiving. So far as they can see, Great Britain might with equal justice have presented the United States to the descendants of the red tribes who once owned this country, and have called upon the world to applaud its act as one of long deferred justice. A fairly good case could be made for such a transfer.

*The Moslems Do Not Love Balfour*

Palestine is well policed by the British soldiery. I found myself admiring the courtesy and courage of the young soldier lads who were doing their duty.

There is no indication that the Jews will attempt any plan of governing Palestine. Such an undertaking would be too sanguinary for pleasant contemplation. I should be inclined to think that any gesture on the part of the Jews toward the setting up of a government of their own would be likely to result in a revolt that would wipe out the whole Jewish population. However, the leaders of the Zionist movement hope for the time when they will be in the majority and can do as they like.

There is no unified and accepted program of Zionism. There is hope of establishing a series of colonies, so many of them and so large, that the Jews who choose to make their home there can feel that the land is theirs. There is hope for a congenial, coherent, united population, whose support is based on agriculture. Beyond that there is very wide difference of opinion.

But however many Jews are persuaded to live in Palestine, the average Jew in Poland who seeks to migrate—and one cannot wonder if they all have that desire—thinks not of Jerusalem but of New York City as the city of his hope, and America as the land of promise.

# Galli-Curci Swayed by Swedish Mystic

(*Continued from page 8*)

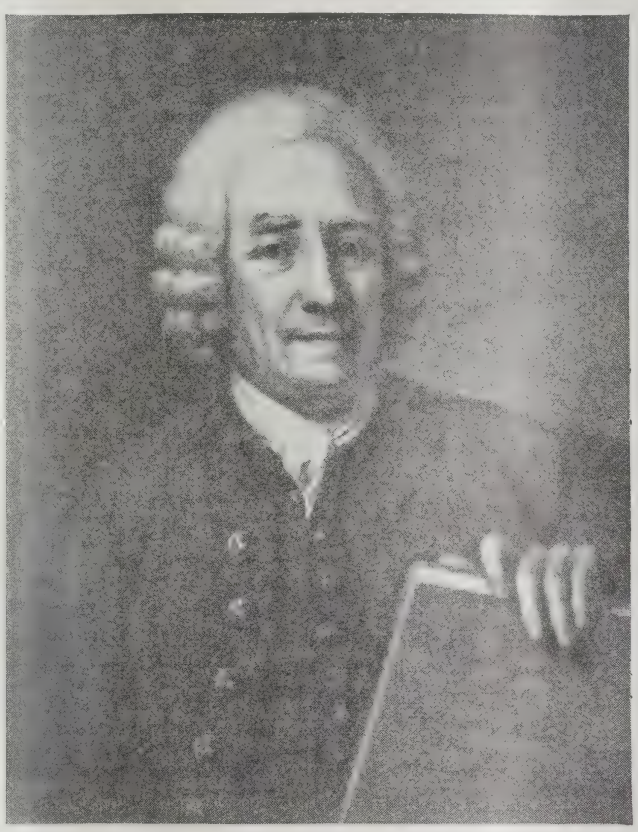
Ralph Waldo Emerson, poet and writer, educated for the church, delved into Swedenborg as he wrote his *Representative Men* and declared him one of the "missouriums and mastodons of literature," not to be measured by whole colleges of ordinary scholars, but whom only a few may read.

President Charles Eliot of Harvard University and Five Foot Book Shelf fame, in his youth, was a considerable reader of Swedenborg. One may see the reflex of it in his article entitled, *The New Religion*.

Can you believe that Galli-Curci, known as one of the great opera singers of the world, and all her life devoted to art and music, could take a summer's vacation, read those thirty-two volumes and master them with an understanding more vital than student or preacher?

About two years ago there appeared in a Cleveland paper a paragraph that, among her other accomplishments, Galli-Curci had read all the theological writings of Emanuel Swedenborg. The claim seemed so absurd that I thought it might be easily punctured by a simple inquiry as to the edition. I therefore wrote directly to Madame Galli-Curci and promptly came the reply:

Des Moines, Iowa.
Nov. 12th, 1923.
Dear Mr. Barron:



I have your letter of the 7th inst. Yes, I have read in the past year the complete Swedenborg Works, in fact it is the Rotch Edition of Houghton Mifflin & Co. that I have.

You ask me what my relation is today to his works. Now that is a "large order." I can say certainly that the Bible to me is a greater work than it was before. By that I mean it takes on a deeper meaning. I have a tremendous respect for the intellect of Swedenborg. His direct simplicity of style and sincerity of purpose together with the fact of his intensive study and accomplishment in other fields are enough for me to put the stamp of truth on his entire Works. I am certain that I shall continue to study them all my life.

Believe me Sincerely yours,
A. Galli-Curci.

My astonishment was intensified. I had caused the publication of the Rotch Edition of Swedenborg's works in 1907, the translation of which, for this edition, began thirty years before; and I have been for some years chairman of the Rotch Trustees.

Familiar over many years with Swedenborg's general theological writings, I had set out to read the entire thirty-two volumes preparatory to an advertising campaign for the sale of this edition. Reading a few pages each day—about all that an ordinary brain could daily digest—I finished my self-imposed task in fourteen years. I shall probably finish a second reading, at my present rate of progress, in perhaps ten years. Is it possible that a woman with no previous knowledge or relation to these books had really intelligently read them within a year?

Emanuel Swedenborg, scientist, theologian and thinker.

I therefore wrote again and received a reply from Los Angeles, of date June 5, 1924:

> It is quite surprising the number of letters I have had regarding my interest in Swedenborg—which leads me to believe that there are more people interested than we probably imagine.
>
> I note your expressed wish to have a chat with me, but owing to my foreign bookings I shall not be in Boston again for at least a year and a half.

I replied that I would travel quite a distance to meet her for a half-hour's chat as I was interested in advertising to the public the value that was in Swedenborg's works. I suggested that perhaps it might be arranged when she came east of the Rocky Mountains or was at her summer home in the Catskills. Appointment was made for September by letter in which Galli-Curci wrote as follows:

> I think I ought to tell you that I hardly feel competent to give very valuable advice. I do not claim to fully understand so gigantic a work as Swedenborg's, but I read it continuously and it has meant much to me. I wonder how the general public would receive it? Certainly there are some to whom it would mean much.
>
> In a previous letter, of March 3, 1924, to a friend of mine, she had written:
>
> I first became acquainted with the Swedenborg works last spring just a few weeks after I had lost my dear mother in April. I, of course, had known of Swedenborg as one of the greatest intellects of all time, and by a peculiar coincidence, just after the death of my mother, I received a circular describing the Rotch Edition of the works and lost no time in sending for the complete set which absorbed me during my entire summer vacation. They have meant and mean more to me than anything else I have ever read. It is a great experience to have one's intuitions corroborated by so eminent a mind as Swedenborg.

I motored up into the Catskills, and by a rough mountain road from Highmount to still greater heights at *Sul Monte*, the beautiful Galli-Curci home perched upon a mountain spur twenty-five hundred feet above sea level and commanding a magnificent panorama in the valley below, with fields and orchards; and lakes and mountains beyond. Here it is not Galli-Curci, but Mr. and Mrs. Homer Samuels at home in a perfect Italian villa and courtyard, the stone-wrought buildings most artistically arranged; the home beautifully furnished, everything having its position, its service and its beauty.

It looked as though this sun-kissed nest might have been perched here for many years. "We have been here only two years," she said, "but we did a lot of planning and studying before we built."

The large reception room and library looks out east and west. To the south is the beautiful music room in the form of a chapel and on the north side of the room is the wall of books in the center of which were the thirty-two volumes in the half-leather edition which Madame Galli-Curci describes in her writings as: "My admirable Swedenborg whom I love to read," and of which Houghton Mifflin people say: "It is the handsomest set of books we ever issued"—this, of course, pleasing to me, as I had selected the binding, the type and the paper with the cream tint that every newspaperman knows is most restful to the eye.

One volume was missing, but it lay upon

the table and Madame explained that she had recently been showing it to a friend. But the book showed that it had been thoroughly read.

Hours flew like minutes. I wasn't the questioner. Mr. and Mrs. Samuels were at me with the sharpest and deepest questions. They seemed in perfect harmony, mentally and spiritually, as in their work in music.

She wanted to know about the "Grand Man" that which had not seemed clear to her. Responding, I told her about the wonderful things in *The Apocalypse Explained,* which Swedenborg had left in manuscript and which was later published, but had not been included in the Rotch Edition, limited to the works (including *The Apocalypse Revealed*) that he had himself published and deposited in the libraries of the world. In this work she would find many wonderful things on this subject. But it would be easier to comprehend it if she would forego the idea of time and space and consider, as Swedenborg says in *The Apocalypse Explained,* that every society in the heavens connects with some organ of the human body and helps to sustain it. Therefore the heavens have the organization of the "Grand Man," but we need not think of it as shape or figure.

***Read Thirty-Two Volumes in One Season***

"Yes," exclaimed her husband, "I see it; it is organization." I explained, also, how the *Psalms* likewise connected with every society of the heavens, and how the world within and without was knit together in one grand poem and song of creation, man in the image of his Maker and knit into Him through the heavens, from which he has life in every organ of his body.

"Now I understand," she said, and asked me for explanation of other things. Her intelligent questions, as well as her statements, left no manner of doubt that Galli-Curci had performed the stupendous feat of reading the thirty-two volumes of Swedenborg in a single summer season. She declared *Heaven and Hell* and the other works are really taken from the *Arcana,* which is the greatest work of all, but it is very difficult reading and I do not think everybody can read it. *Heaven and Hell* is a very attractive and popular title and concerns that about which people are most eager to know; but it is not one of Swedenborg's great works; although it makes a good, popular and introductory work."

Galli-Curci understands the writings of Swedenborg even better than theologians, because she puts them into practice in the broadest life of loving helpfulness. Her speech was earnest and direct; her words well chosen and straight from the heart. No one could doubt the integrity of her statements.

***Swedenborg Helped in Her Work***

It was Galli-Curci's great love for her mother and the desire to know the world whence her mother had gone that had caused her to devour Swedenborg with avidity. She said that, propped up in pillows, she read it in bed until long after midnight. She could read it very rapidly because *arcana, proprium, conjugal,* and such Latin terms were to her Italian, but very difficult of translation into English. (*Arcana* carries the idea of box within a box and is often translated "secrets." *Proprium* involves all that is of man's own, whether good or evil, internal or external—his self-hood, *conjugal* or *conjugial* is the sex union that exists in all creation.)

Amelita's father was Italian, her mother Spanish, and she was educated at a German school in Milan where she was taught French and English, so that she early had mastery of five languages.

She said that Swedenborg had helped her in her work. She had no longer to think of herself but of her audiences, and let the music flow through her; regard herself just as a medium for life to pour through. She felt with and for her audiences, and singing was no effort for her.

"The more you do—the more you give forth—the more life and energy is poured into you, and you are stronger and not weaker for the doing, the working and the singing. I always feel stronger; I am not exhausted at all by my singing. Swedenborg shows the reason and how life comes in as you pour it forth usefully to others. You don't have to try or worry or fret. You know it is not you but that it is just being done through you."

Speaking further of the help Swedenborg had been to her in her work she said: "One gets so much more confidence. The other world and the one life, that comprehends all life, becomes reality and all fear and worry vanish."

I said to her: "I have recently determined that it is really faith acquired or inherited that does the big things in the world. John D. Rockefeller acquired faith from his Bible-reading mother, and borrowed all the money he could, to store oil when it was going to waste and considered of no value. He had faith in the Author of that oil. E. H. Harriman was the son of a clergyman who never earned more than $600 a year; but he was brought up in a religious atmosphere of faith and in faith he never faltered, whether rebuilding the Union Pacific when the men who preceded him said it never could be worth it, or filling in across the apparently bottomless Salt Lake to make a shorter rail route."

***Sir Basil's Opinion of the Star***

We talked of Emerson, Henry Ford, Sir Basil Zaharoff, and I read to her a letter I had recently received from the so-called "mystery man of Europe" who has been, for many years, a dear personal friend of mine and as open and frank as it is possible for one friend to be to another. Among other things Sir Basil wrote:

> Replying to the last paragraph of your letter of 8th instant, asking if it is true that Japan has ordered 140,000 machine guns from the British Vickers Company, I must tell you that Japan has not ordered one single machine gun, but it is evident that your papers keep the Japanese fire going by always using the bellows.
>
> What you tell me about Galli-Curci is very pleasant, because I am one of her greatest admirers, and consider her a big musical star, who is adored for her singing, and much appreciated for her learning.

We talked of many of the issues of life and death. I said: "I see so many people about me who are really dead because they are doing nothing and have no interest in their country or its future, or anything outside of themselves."

Madame replied: "Only by doing, by expressing, or letting life express itself through you do you live and get yet more life. The more you give out the more you have."

Her husband said: "One of the wonderful things to me about Swedenborg is his explanation of the difference between human life and animal life, and how man has a soul that cannot perish."

He thought that advertising Swedenborg's works might be helpful if it contained some little biography telling who Swedenborg was and what he had done. They both thought that his life and work and accomplishment had been so wonderful, and it seemed so little was generally known about him.

I suggested she should expand her four biographic articles in *The Ladies Home Journal* into a little book that would be helpful. She said that she could easily do that, and thought she would. She thought she might say something in the book that would be helpful to students, whom she wanted so much to help.

***How Galli-Curci Discovered She Could Sing***

She took me into her music room, built somewhat like a chapel, and which she called her church, showed me various photographs and asked me to select. I chose one, which she autographed, and one of herself and her husband, which they both autographed. She showed me photographs of her father and her mother, who must have been very strong personalities. Her mother's face, she said, was always like that—just breaking into a smile.

I noticed that her father's ear was the ear of Napoleon, and she said that he had a great resemblance to Napoleon, especially about the eyes. I said I could not understand how she could then have been brought up a poor girl. Certainly her parents had capacity to create and accumulate. She exclaimed: "Oh, I was brought up with luxury. But when I was sixteen my father's fortune was all swept away.

"I then said, 'Here is my opportunity to help.' And from sixteen to twenty I carried the family with my music and teaching. It was then I discovered my singing talent. I had always sung in my girlhood, but did not have ambitions as respects my voice. I had been trained to music on the piano. Then at sixteen I began to teach and to sing.

"It is probably true that if my father's fortune had not been swept away I should never have advanced as a singer. Father recovered his fortune later in Brazil, but I continued my career."

Don't think for a moment that Galli-Curci's life has been one triumphant upward flight to fortune and to fame. When a world-famous prima donna, she wrote: "Fame! O! magic word that lifted my tired feet over the hard, unyielding stones of the streets of Naples; that gave me the visions of the opium eater when I ached for food in those far-off and fugitive days when, with strength far spent, I strove to charm passersby on the other side of the street with my poor song."

***An Afternoon Never to Be Forgotten***

Galli-Curci showed me a wonderful photograph of Duse, so expressive of tragedy and the tragedies in her own life. It was given to her in Chicago not long before Duse's death. She had talked with Duse of Swedenborg and said, "Why don't you read him?" Duse had replied: "Perhaps we shall meet Over There. If so, will you give me just a little handshake?" And the reply was: "I will."

Discussing the difficulties of translation, I noted that it had taken 100 years to determine that *conjugial* and *conjugal* were but two ways of spelling the same Latin word and that it meant only marriage love, which begins in the divine union of love and wisdom and permeates all creation. "Yes," said Galli-Curci, "the book on *Marriage*

*Love* is a wonderful work. I read it with much interest. Do you know, I do not believe as some artists do, that to portray certain characters you have to go down into the slums and get bad association into yourself. I do not believe it at all. I find that people want a good woman on the stage, whatever she presents, and you can present evil without being evil. Do you know, audiences are repelled by an artist whose character they distrust, whatever the artist may attempt to represent, good or bad?"

I responded with a line from Emerson: "What you are speaks so loudly to me that I cannot hear the words you say." Both Madame and her husband thought that a wonderful line. Her husband is a great admirer of Emerson, and was very familiar with his essay on *Compensation*.

It was indeed an afternoon never to be forgotten. Every word is impressed upon my memory. Later came this letter:

"Sul Monte," Highmount, N. Y.
Sept. 23rd, 1924.

My dear Mr. Barron:

You have asked me to write you what the reading of Swedenborg's works has meant to me. I first became acquainted with these books shortly after the death of my mother about a year and a half ago. To me it is the most inspired and sound philosophy that I have ever encountered. It is an explanation of life—its meaning and purpose—which satisfies that something within us which we know is only appealed to by the truth. As fantastic as some of the "revelations" may seem on first acquaintance, one is fortified in the knowledge that it was written by a man whose thought had for years been trained in the strictest schools of science and sound reasoning and it is therefore impossible to believe that Swedenborg's personal experiences, unusual as they were, are otherwise than set forth. A man of his tremendous mentality and scholarly attainments cannot have been misled by phantasies of any sort. To believe that they are products of imagination does more violence to one's reason than to accept them as Swedenborg gives them—statements of fact falling within the limit of his personal experiences. The greatness of the work, however, lies in the soundness and comprehensive scope of the philosophy therein set forth. I wish that more people might come to know these inspired works. Believe me, with best wishes,

Sincerely yours,
Amelita Galli-Curci.

Writing later from Australia she says: "I have had a great joy out of the inspired works of Swedenborg, and I read them all the time."

Some day some one may write a volume about this most wonderful woman. If she could find the time she might write it herself, and better than anybody else, for her literary ability is second only to her musical talent.

I have here written only a chapter, with no ambition in authorship; but rather ambition to help others who, like Galli-Curci, may come to understand that happiness is in helpfulness—the simplest summary of the writings of Swedenborg and the life lesson of Amelita Galli-Curci Samuels.

the drastic regulations imposed by the government of Hongkong, China, against the importation of arms into that Colony are beginning to have a great effect in checking crime. No revolver, pistol, or other firearm may be brought into Hongkong without a special permit. Any infraction of this rule by either Europeans or Asiatics is punishable by a sentence of twenty-five years' imprisonment and *ten strokes of the lash*. That sentence means just what it says. The Hongkong government has not yet instituted a pardon board.

Robbery by armed Chinese has shown a marked decrease since the law became effective. Hongkong being the main port of entry into South China, the local regulations of the Colony are affecting the hinterland, as it is impossible for Chinese to get arms or ammunition through the Colony, the regulations giving the police authorities power to seize any arms or ammunition found on board any vessel in local waters which has not been declared.

---

"the profits in the liquor business are so great that men who might be earning a decent living otherwise are tempted into this nefarious traffic in brandy and rum, and, what is still worse, the example of so much drinking everywhere about the city is corrupting our public servants and our youth in a pernicious way." And then I discover that what I have been reading is not a news item of the day but an extract from an edict issued by the burgomaster of the city of New Amsterdam, now New York, some 250 years ago. The burgomaster was greatly concerned over the situation. "The common people and the city's servants," he continues, "are seriously debauched, and what is worse, the youth, seeing and following are drawn from the paths of virtue and into all sorts of irregularities. Hence also proceed cheating and smuggling and frauds and clandestine sales of beer and brandy to the Indians and natives as daily experience, God help us, shows, from which nothing but new difficulties between us and them ought to be apprehended." It is not until we come to this last sentence that we have any reason to suppose we are not reading a piece of contemporary criticism of modern life and morals. Truly the mark of the beast is always the same.

---

Dinshah P. Ghadiali, originator, lecturer and sales manager of Spectro-Chrome Therapy, who was recently sentenced to five years in prison and fined $5,000 by Judge Bean of the United States District Court at Portland, Oregon, for violating the Mann Act has appealed his case. Ghadiali, who styled himself "colonel," was the subject of an article in THE DEARBORN INDEPENDENT for March 15, 1924, in which his scheme for curing all the ills of humanity through "attuned color waves," emanating from his own machines, was discussed at some length. It was Ghadiali's custom to give lectures on his discovery in various cities, charging from $50 to $200 for the twelve-day course. Those who paid the sums and listened to his lectures were privileged to purchase one of his machines at a cost of $425, and to tack the letters, S.C.T., meaning Spectro-Chrome Therapist, after their names. They were then ready to treat that portion of suffering humanity which visited their offices.

---

the February criminal term of the circuit court at Lexington, Kentucky, probably established a world-record in 45 convictions, two hung-juries and three acquittals, out of 50 cases tried. Of the eight capital cases included in the above docket, three death sentences were inflicted, three life-terms, one 21-year sentence and one hung-jury. Then there were 13 felony convictions carrying 82½ years in penitentiary sentences and 24 misdemeanor convictions carrying six years, 165 days and one hour in jail sentences and $3,350 in fines. Judge Richard C. Stoll and Commonwealth's Attorney, Maury Kemper, says the Lexington *Leader*, deserve universal recognition for this clean-cut administration of justice of a sort that will make potential evil-doers avoid Fayette County Kentucky.

---

Frederick E. Keppel, president of the Carnegie Foundation, has been conducting an inquiry into so-called adult education in America with special reference to the opportunities afforded those who are either unable to qualify for regular college courses or to spare the time necessary for full collegiate work. None of the universities blessed with immense private endowment funds has drawn upon them to maintain "extension" work for the classes just mentioned. The largest endowed university indicates that in 1924 the receipts from students attending extension courses aggregated almost one million dollars as against expenditures of less than two-thirds as much. The stronger state universities demand about five-sevenths of the cost of such courses from the students and the smaller state institutions require that the full cost be paid. On the other hand none of these universities ask that the more fortunate full-time students pay anywhere near the cost of their education, the proportion of such payments in no case equaling that required from the extension course students.

Price: 25 cents each; set $1. The Dearborn Publishing Company, Dearborn, Michigan.

# Wilson Disliked Reporters

(Continued from page 5)

Governor Wilson's summer home, at Seagirt, New Jersey, known at the time as the "Little White House." It was here that Wilson received news of his nomination.

porters (particularly political writers) are in the habit of having public men go out of their way to be accommodating. Many public officials (whether of high or low degree) are "publicity hounds," who have made a close study of the game and play it to the limit. Mr. Wilson's attitude, therefore, was not understood. It mystified the newspapermen and, in the last tragic years of his life it may have lost him some journalistic attentions which probably would have been his if his earlier contacts could have been on the intimate, easy-going basis which the correspondents assumed was their due.

As a matter of fact there was an easily understood explanation of Mr. Wilson's attitude. Very early in his semi-public career as president of Princeton University, he had found himself so often misquoted or carelessly reported by the press, that he came to the conclusion that in their haste to get out today's edition the reporters gave little thought to accuracy and cared little for the judgments of the future. Accuracy was to him an obsession. The misquotation of a vital truth apparently did not disturb his ego. It did, however, fret him because he feared that it might add to the loose thinking and talking of the day that he had observed was so prevalent.

His publicity complex reached back into his early Princeton days. In October, 1908, he delivered an address before the American Bankers Association at Denver, Colorado, that caused considerable comment among the bankers and in the press. One of his startling sentences of that occasion was that "men had almost forgotten to féar the Government—but had fear only for the power of capital." To correct this state of mind among the business men he advocated a revitalizing of our governmental functions. In amplifying his recommendations he was led to discuss the point of view of the Socialist toward the Government, and to contrast the Socialists' program with that of the Democrats. The following morning one of the leading papers of Colorado, which was then a Democratic organ, but at that time not sure of Mr. Wilson's progressiveness, carried an editorial in which it both praised and condemned his speech. The editor had lifted a sentence from the context of Mr. Wilson's speech, and put it in quotes so that it had Mr. Wilson saying without any qualification that the principles of Socialism and those of Democracy were almost identical. This statement, as coming from a college president, was sure to arrest the attention of the thinking public.

The editor, having thrown aside entirely the setting from which the sentence had been lifted, then sought to pulverize the idea conveyed by his quotation. He said in substance that Socialism sought to reach its growth through plutocratic despotism, whereas the Democratic party sought to attain its ends by the route of the greatest possible liberty of individual action. With a closing "stinger" to the editorial, he said that "college presidents should be more careful not to add to the mental chaos already in existence."

The next morning as Mr. Wilson was reading his paper, his eye lighted upon this criticism of his speech. A shadow crossed his countenance as he read it.

There was no escaping the fact that this hasty piece of reportorial work upset his usual calm demeanor, though he gave little expression to it. However, at the station just before the train pulled out, he asked me if I would see that the statements were corrected. I did so by calling upon one of the other papers and comparing with its editor what Mr. Wilson actually had said and the language of the editorial. It is needless to say that the editor made a sufficient display of the corrected statements.

What Mr. Wilson had actually said was that the abstract principles of Socialism were not difficult to admire; that they were hardly distinguishable from the abstract principles of Democracy. He believed that the object of the thoughtful Socialist was to effect such an organization of society as would give the individual his best protection, and his best opportunity, and yet serve the interest of all rather than the interest of any one in particular. Socialism, in his understanding, contemplated an organization of mutual benefit, based upon the principles of the solidarity of all interests. *But, said he, the program of the Socialist was another matter. It was not unfair to say that the programs of Socialism so far put forth were either utterly vague or entirely impracticable.*

On receipt of a corrected statement of his address in the press, he expressed his relief in no uncertain terms by return mail.

This lack of strict accuracy on the part of the press made him extremely cautious. One night during his preliminary tryout for the presidency in 1911, Governor Wilson, after speaking to the Harvard students at Sanders Theater, Cambridge, addressed the Princeton alumni at a downtown Boston hotel. In the middle of his remarks some young men entered, sat down and pulled out paper and pencils.

"You are representatives of the press, I believe," said the Governor with a smile. "Now I will know how to govern myself. I have learned from bitter experience how necessary it is to measure one's statements when the press is present."

He said it with a smile, but with such emphasis that his meaning was not lost on any of those present.

It was the pyramiding of incidents similar to that which occurred at Denver that made Mr. Wilson skeptical and fearful of the work of the reporters and caused him to shrink within himself in their presence. This dread of being misinterpreted in regard to the ideals he believed in, or the policies he advocated, caused him to say more than once in the desperate days of the world conflict that he spent much of his time trying to keep from saying the right thing in a way that could possibly be misinterpreted.

President Wilson's attitude toward the press was also based to some degree on the fact that he had never mixed in the rough and tumble of local politics, but had lived, except for a very short period as governor, the life of a comparative recluse, so far as journalistic contacts were concerned.

The average public official usually reaches his goal by going into politics in his own town, running for the city council, serving there a few years, and then becoming mayor or district attorney, from which it is a logical progression to Congressman, Governor, Senator, and perhaps President.

Mr. Wilson had none of this background. It was due to this, in fact, that he and the newspaper correspondents got at cross purposes in their very first meeting after he was nominated for President. The story of that "conference," given to me by an experi-

Wilson's cabinet of newspapermen at the White House.

enced newspaperman who participated in it, and here related for the first time, explains an important, misunderstood phase of Mr. Wilson's subsequent, official activity as President of the United States. If some of the newspapermen had not got off on the wrong foot in that very first gathering Mr. Wilson would undoubtedly have met the Washington correspondents more openly when he entered the White House eight months later, given them his confidence, and been helped over some of the rough spots of his difficult administration by more friendly coöperation.

On the day that Mr. Wilson was nominated by the Baltimore Convention he was in the Governor's summer home at Seagirt, New Jersey, with Mrs. Wilson and his three daughters, Margaret, Jessie (now Mrs. Sayre) and Eleanor (now Mrs. McAdoo). He was living the quiet, secluded, happy life of a Southern gentleman, surrounded by his womenfolk—a view which Mr. Wilson always held of his home, whether it was in his modest cottage at Princeton or the Executive Mansion in Washington. With perfect freedom the family strolled about the grounds, took a dip in the surf, played tennis on the courts back of the house, hiked about the neighborhood, lounged on the broad verandas, read, sang or gossiped as they pleased, without interruption or restraint.

The next day, July 3, 1912, they were deluged. Everybody in New Jersey who could get there swooped down on Seagirt. In fact, it seemed that everybody in the United States within twenty-four hours of the little station ( which isn't even a town) had suddenly been seized with the same idea: To go to see Governor Wilson. The effect was stupendous. A literal swarm of humanity, of all ages, sorts, classes, nationalties, and persuasions, overran the Governor's cottage, drove the family to the upper floors and took possession of the premises. For twenty-four hours utter confusion reigned. There was no order or system about anything. When a member of the Wilson family showed his or her head he or she was dragged about and almost trampled underfoot by a surging, curious crowd of people who pushed and shoved themselves through the house as if it were a public hotel.

***The Fateful Session With Newspapermen***

Among the mob was every variety of journalist known to the craft, from the economic expert to the sob-sister. At every door, front, side, and back, was a crowd of news photographers and motion picture operators. If the charming, dignified Mrs. Wilson, a courteous, cultured Southern lady, or if one of the daughters, seeking to avoid the crush, bethought herself to slip through the kitchen, she was pounced upon the minute her face was seen, her hands were seized and she was dragged into the open and made to stand up and have her picture taken.

"Here, not that way! Turn around, so the light'll show your face."

"Look this way. That's right. Now, let's have some action! Smile!"

Such commands were rattled at them as they were shoved hither and thither at the bidding of utter strangers. In the meantime, Mr. Wilson was seized whenever he could be reached and pulled and hauled about while questions were hurled at him as if they came out of a Gatling gun. Every conceivable sort of inquiry was propounded, from a demand for his opinion on the length of golf trousers to what he thought of the Prince of Wales. Also there came letters and telegrams.

Without any office force whatever, and without any place in which to house such an organization if he had had one, Mr. Wilson found himself, the second day, with an even carload of mail to open and answer. A low rambling building was eventually requisitioned from the National Guard, which has a rifle range at Seagirt, and army tents were erected on the lawn for the accommodation of clerks, telegraph operators and reporters, but long before these orderly preparations had been made the historic first newspaper conference had been held and the seeds of trouble sown.

Woodrow Wilson and Secretary of State Bryan, at time of the first cabinet.

By sundown of the second day some one advised Mr. Wilson that it was customary for presidential nominees to see afternoon newspapermen at 11 a.m. and morning newspapermen about 7 or 8 p.m., so the word was passed about that a conference would be held immediately after dinner in the Governor's library.

By this time a set of guards in the person of family friends had been pressed into service. The crowd had been driven out of the house itself, and at each door a determined individual had been posted to prevent any further intrusion. The big galleries running around three sides of the house continued, however, to swarm with visitors, who peered into doors and windows in an effort to see the Governor. The hunted family imprisoned itself upstairs. Accustomed to quiet dignity in their home and given to the habit of courteous consideration of each other, they were thoroughly upset by the whirling events of those first two days.

At the hour appointed for the newspaper conference about thirty-five men and women trooped into Mr. Wilson's library, eager for the interview, avid for news. During the previous two days this comparatively secluded scholar had become the biggest news source in the country. Publications of all descriptions were hungry for "copy" about him and his family. The four big press associations, the larger daily papers, and numerous weekly and monthly magazines were represented. An unusual condition (which bears on the result) was that most of the newspaper correspondents were New York City reporters.

The two national conventions, at Chicago and Baltimore, held during a terrific heat wave, had worn out the political staffs from the Washington bureaus. For this reason only one Washington political writer was present. Ordinarily the press associations and the larger newspapers send experienced political reporters from their Washington offices to "cover" presidential candidates.

The correspondents ranged themselves in a half-moon on one side of the room and Mr. Wilson entered, striding rapidly with a springy step as was his custom, a kindly smile on his lips and a friendly welcome in his eyes. He wore a well-tailored blue serge coat, flannel trousers and white shoes. His whole attitude, manner and expression indicated that he was happy to see the correspondents and that he anticipated a cheerful, agreeable conference with them. He half sat and half leaned back on the edge of his desk, facing the group, his eye meeting theirs frankly. He was in a pleasant mood and radiated good-nature.

'Good evening, ladies and gentlemen," he said, "I am sorry I cannot provide better accommodations for this meeting but, as you have probably observed, our facilities here are limited. I hope you will overlook our shortcomings."

"That's all right, Governor," promptly exclaimed an unabashed reporter from one end of the semicircle, "we don't care how long we have to stand up if you'll give us some hot stuff."

Mr. Wilson turned his head quickly toward the voice and the least little bit of his happy expression faded from his face. It was only momentary, however. The reporter grinned and Mr. Wilson's smile came back. Just then a voice came from the other side of the group.

***"Wilson Feels Like a Frog"***

"You've got the first page now, Governor," it said, "and if you treat us right you can keep it. You want to do a lot of stunts, though, or Teddy'll take it away from you."

Again a slight shadow passed over Mr. Wilson's face. He turned toward the new speaker, but before he could say anything a third correspondent broke in, from the center of the crowd.

"We're all on space down here, Governor," he said, "so the more dope you hand out the fatter our strings will be."

At this observation the happy light faded almost entirely from Governor Wilson's countenance. His mouth came down at the corners, as was habitual with him when disturbed or worried. His eye ran quickly over the group, as if he were trying to figure out what sort of people these were who had been sent to confer with him over the serious business of the presidency. His cogitations, however, were interrupted, and

from that point the so-called conference moved rapidly, if strangely.

"What you been doing today, Governor?" one young man demanded.

"Really, I hardly know how to tell you," Mr. Wilson replied, running his hand over his eyes as if trying to brush away distracting thoughts. "It has been rather a kaleidoscopic day, I . . ."

"Some politicians came to see you, didn't they?" demanded a new interrogator.

"I believe there were a few visitors from Washington," the Governor replied. "I recall that one was Senator Reed . . ."

(The first member of Congress to call on the new party leader.)

"What's Reed's initials?" came from one end of the line.

Governor Wilson looked toward the speaker in surprise.

"James A." he replied quietly.

"Is Reed a state Senator or a United States Senator?" another journalist asked.

As Mr. Wilson turned to answer this query his face was set in firm, serious lines. His thoughts were as plain as if he had expressed them aloud, and he subsequently confirmed them by telling exactly what was in his mind on that occasion. It was this:

"To think that my destiny is in these hands!"

As the interview progressed Mr. Wilson drew more and more within himself. Every instinct of frank discussion of his candidacy was snuffed out by the lack of tact of a half-dozen "hard boiled" Manhattan Island reporters, to whom the conference was a gala event affording opportunity for them to shine. Only once did the Governor give a flash of his natural, amiable attitude toward what he used to call "the laying of minds alongside of each other." That was when a correspondent asked him what he was doing about his mail.

"Why," replied Mr. Wilson, with a smile, "I feel like the frog that fell in the well. Every time I jump up two feet I fall back three."

The next morning, as he looked over the newspapers, thinking to find some reflection of the seriousness with which he was entering upon the campaign, he was shocked to discover, from the headlines, that "Wilson feels like a frog."

This was typical of many things that happened early in the presidential canvass and served to create what would now be called an anti-newspaper complex, which exerted an influence upon Mr. Wilson's eight eventful years in the White House.

## "The Greatest Fool"

WHAT Benjamin Franklin would have thought of the assemblages of wise men held during these recent years may be found in one of Ben's letters of 1784.

"It is wonderful how preposterously the affairs of this world are managed.

"Naturally one would imagine that the interests of a few individuals should give way to general interest; but individuals manage their affairs with so much more application, industry, and address, than the public do theirs, that general interest most commonly gives way to particular.

"We assemble parliaments and councils to have the benefit of their collected wisdom; but we necessarily have, at the same time, the inconvenience of their collected passions, prejudices and private interest.

"And if we may judge by the acts, arrets and edicts, all the world over, *for regulating commerce, an assembly of great men is the greatest fool upon earth.*"

# Legislating in Secret Session

*Concluded from page 4*

program. *The present strength is not enough. We are already cut to a dangerous low limit in our foreign garrisons and these cannot be cut further.* On the other hand, the enlisted personnel in this country is unduly strained in the effort to maintain the various training camps and to operate them during the civilian training camps in summer. As a result the morale of the Regular Army, 'the force that should constitute our standard of military efficiency,' is below what we should demand of it."

In his annual report of 1923, after an enlisted strength of 86,000 for the Navy had been adopted as a compromise—a minimum below which it was not safe to go—the then Secretary of the Navy said:

"Economy has been enforced in every branch of the Naval establishment and it has been our continual effort to use funds appropriated so as to secure the fullest results possible for every dollar expended. Forces at the Navy yards, training stations, and other shore stations have been reduced to the minimum that is required for the maintenance and operation of these activities. Further reductions would be highly injudicious and inconsistent with efficiency and economy."

But Budget reduction in appropriations for the Navy continues, although by law in 1923 the strength of the Navy was supposed to be fixed at 86,000. In his report for the fiscal year 1925, Secretary Wilbur said:

"The appropriations in the pay for the Navy permitted enlisted strength to be maintained at 86,000 as intended by Congress until the three last months of the fiscal year 1925, when it became evident that unless the numbers were reduced a grave danger of overexpenditure would exist. Accordingly, recruiting was suspended and the enlisted strength allowed to decrease to 84,289, in June of 1925. The same appropriations for pay of the Navy having been made for 1926, as in 1925, *it is evident that a more serious shortage in funds appropriated for the pay of the Navy faces the department for the present year,* and as a result it has become necessary to reduce the average strength for the first several months to 82,000. The policy to be adopted during the second half of the present fiscal year will depend upon the funds remaining available during that period."

***Nibbling at the Vitals of Our Defenses***

Referring again to President Coolidge's first message when he said: *For several years we have been decreasing the personnel of the Army and Navy and reducing their powers to the danger point,* it should be stated that at that time the average strength of the Regular Army was 119,574. Its authorized strength was 125,000, *but that had not been maintained* and President Coolidge warned Congress of the dangers of making this reduction. He said that "both of these services should be strengthened, rather than weakened." *But they have both been weakened.* For, at present the enlisted strength of the Army averages 118,000, despite the fact that both former Secretary of War Weeks and Secretary Dwight Davis declared that 150,000 is demanded to carry out the provisions of the National Defense Act. No one knows how much further the strength of the Navy is to be reduced through the secret operations of the Budget.

This system of nibbling at the vitals of the nation's defenses through the operations of the Budget is illustrated in a striking way by the Army Appropriations Bill that was reported to the House at the beginning of this session. Two years ago, after extended hearings, a bill was reported out of the House Committee on Military Affairs providing for 1,800 additional noncommissioned officers for the Regular Army. The bill was passed upon the urgent request of the National Guard, reserve officers, and educational institutions which maintained military departments. Noncommissioned officers who have been the backbone of the Regular Army are now recognized as a vital part of the civilian training system. They are the backbone of the Army of the United States with its components of the Regular Army, National Guard, and organized reserves.

***Budget Officer Greater Power Than Congress***

But the appropriations bill as reported to the House which carries the Budget's estimates in effect repeals this noncommissioned officers' bill. It provides for the same number of enlisted men that are in the service now, but reduces the total pay for enlisted men by $938,000. Aside from the great injustice of taking this money out of the pockets of the enlisted men of the Regular Army, the reduction will make it necessary for the War Department to decrease the number of noncommissioned officers to the strength that it was before Congress passed the bill for the increase two years ago.

That is, the Budget officer is a greater power than Congress. Even the Supreme Court dare not reverse Congress *secretly.*

The wisdom and the correctness of the theory of a budget for the Government is not questioned here. It does, however, appear that the items of the budget of the Government should be discussed freely by those who are qualified to do it, not only before Congressional committees, but in public meetings. The people have a right to know whether the reductions called for in the Budget are crippling the machinery of the Government. Above all they should know whether the defenses of the nation are being maintained. *It is for Congress to decide what should be the strength of the Army and Navy,* but this decision should not be made without a free and open discussion of all the questions involved so that Congress can act intelligently and with full knowledge of the people of the country.

The present system of administering the Budget will not long endure. It is not in harmony with American institutions. Sooner or later the American people will insist upon knowing how the Government is being conducted and their money expended. They will not forever submit to secret bureaucratic domination of the affairs of the nation.

***Americans Will Demand a Change***

When they speak through Congress they are going to question the right of any one man—a Budget officer—to nullify their word. Dictatorship in the financial affairs of the nation is the most powerful form of dictatorship that could be imagined, as it controls the very forts of the nation's welfare.

# Manipulating the King's English

## Brevity and Lucidity Are Our Best Word-Soldiers When There Is a Dress Parade

By ALAN MOORE ROBINSON

UNLESS we are adept at "making signs" to those with whom we would communicate, we must make our thoughts known by the spoken word; and happy is he who

employs such shades of rhetoric as will dodge all colloquialisms as one would the shadows.

In case of the written word—"putting our word-soldiers on dress parade"—let us remember brevity and clearness:

"If I am ever obscure in my expression, do not fancy that therefore I am deep. If I were really deep, all the world would understand," says Charles Kingsley.

"Clear writers, like clear fountains," says Walter Savage Landor, "do not seem so deep as they are."

We are all familiar with the story of the editor who, in returning a long manuscript, enclosed the terse note:

"Boil it down, story of creation of the world told in 80 words."

The lovesick swain caught the spirit of this brevity when he poured out his soul in a note of two words:

"Dear Mary:

*Will you?*"

To which Mary replied with equal directness:

"Dear James:

*I will.*"

When there had been a mild mutiny in General Grant's army, and the soldiers were later assembled expecting a reprimand, in walked the General with boots and spurs, and a red bandana around his neck. The assembly was hushed in expectancy. Grant stepped forward on the platform:

"*Go to your quarters!*" he commanded, and his effective four-word speech was ended.

Arlo Bates, in his "*Talks on Writing English*," gives this illustration of the suppression of nonessentials:

"Water having been brought, Pilate, according to Miss Corelli (in *Barabbas*), thus proceeded:

"Slowly lowerin his hands, he dipped them in the shining bowl, rinsing them over and over again in the clear, cold element, which sparkled in its polished receptacle like an opal against the fire."

The Bible finds it possible to say all of this that is necessary in the words:

"Pilate took water, and washed his hands."

Why wander into the mazes of:

"This is the edifice that was erected and constructed by a gentleman commonly known by the name of Jack," where, "This is the house that Jack built" answers our purpose better and is far more direct?

As a former teacher of English, the writer has found it possible to speak correct English the year round without resort to slang or catch phrases for clarity or emphasis. There are, however, those who still maintain the latter of the following phrases is more effective:

"Mademoiselle, your charms are irresistible! I love you!"

"Gee! Kid! I'm stuck on you!"

The raw "aunt" and "bath" of the Middle West find strange contrast to the proper "äunt" and "bäth" of Boston.

The expression of the American cowboy on leaving a casual acquaintance:

"Good-bye, I hope I shall *strike* you again some time," recalls the friendly retort of a visitor in the city to the street car conductor who had gotten chummy with him:

"I hope I *run across* you again some time."

"*Not if I see you coming first!*"

"I *calculate* he won't *show up*," says the vernacular of the Southwest.

"I *presume* he will not *appear*," says the proper New Englander. We *stop* (come to a standstill) at a street crossing, but we *stay* (dwell) at a hotel. Why put a "chew" in con-grat-*u*-late, a "jew" in ed-*u*-cate, a "toot" in in-sti-*tute* (tewt), a "doo" in *dew*, when their *proper* pronunciations are more beautiful?

"That was a good *take off* we saw at the theater," you say, meaning, of course, "a good *imitation*." The sophisticated "I will give your proposition a *write up*" is relieved by the unsophisticated "I will write a *description* of your proposition."

Let us not give the *lie* to civ-il-i-za-tion, and let us en-*u*-mer-ate and never "en-*oo*-merate": and leave the *high* out of hi-poc-ri-sy, and not forget there are *four* syllables in temp-er-a-ment and temp-er-a-ture.

To be correct we say:

"She was en-rap-tured (*tewred* not

*choord*) with the scene." "His fa-mil-iar (*yar*-i-ty was obnoxious." "He was cov-et-ous (*tus* not *chus*) of the cou-pons (*koo* not *kew*), but was too cour-te-ous (*kur* not *core*) to ask for them."

Have you ever tried eliminating the modifying adverbs, "very, very," leaving your sentence stand out clearly alone, "That was good"? Similarly, have you familiarized yourself with the meaning of the words, "wonderful" and "grand," and do you use these with caution born of a desire to give just the right shade of meaning?

The most ungrammatical sentence ever uttered, "*Is them sheeps yourn?*" is euphoniously substituted by the correct, "Are those sheep yours?"

Col'-umn (kol'-um, never *kolyum* nor *kolume*) does not find a comparison in volume, which is properly "ume" at the end.

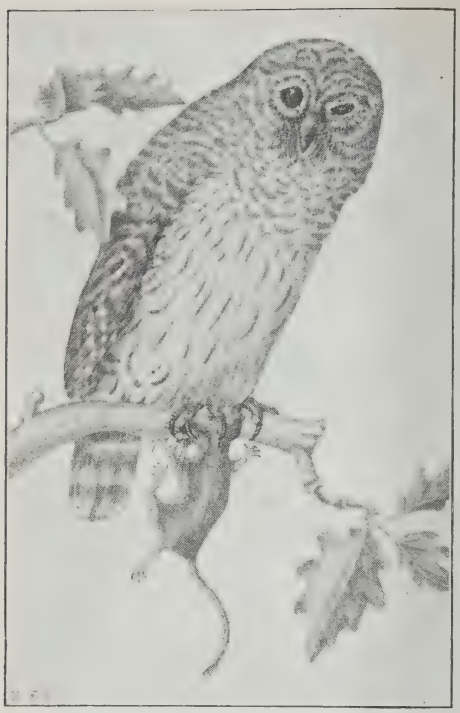
Learn to place every word where it belongs in a sentence:

"She was going *only* to the store," means she was going to the store and nowhere else.

"She *only* went to the store," means she and no one else went to the store.

"She went to the store *only*," has the same meaning as the first sentence.

"My *only* object is to warn you," means the object I have is to warn you.



"My object is to warn you *only*," means to warn you alone, and not some one else.

To return to directness of expression:

"I prefer the kaleidoscopic aggressiveness of this metropolitan city to the somewhat soporific influence of a somnolent town," is far more clearly expressed in:

"I like this city. Its industry and progress appeal to me. Small towns are too quiet."

Barred owl clutching half-grown wood rat.

# The Killers' Struggle to Exist

(Continued from page 2)

emerged from its silken pupal case within the body of a luckless caterpillar and winging its way across a sunny stretch to seek victims, in turn, is taken into the wide mouth of a whippoorwill. Is there so much difference between these acts and the no more sanguinary captures of the falcon or eagle?

Size is regarded with more interest in nature tragedies; bulk counts. The peregrine falcon striking down a duck cannot elicit the interest given to a puma alighting on the back of a deer. Compared to both, the robber fly overcoming a wasp seems a trifling incident, though as a matter of fact more reckless bravery and a harder struggle is witnessed in the latter contest than is ever enacted by the feathered or furred killers. The insect world is full of encounters for life and death that far surpass in fury anything that the vertebrate creatures know, which hints that a coat of mail is more conducive to daring than the fabled backbone. Witness the contests—not always one-sided—between the steel-blue pepsis wasp and the giant tarantula, a black carpenter ant and an ambush bug, a cone-nose assassin bug and a big bumblebee, an under-stone dwelling centipede and a carabid beetle, a tiger beetle and a robber fly, the larva of a ladybird beetle and that of the vicious golden-eyed fly, both bent upon a diet of plant lice.

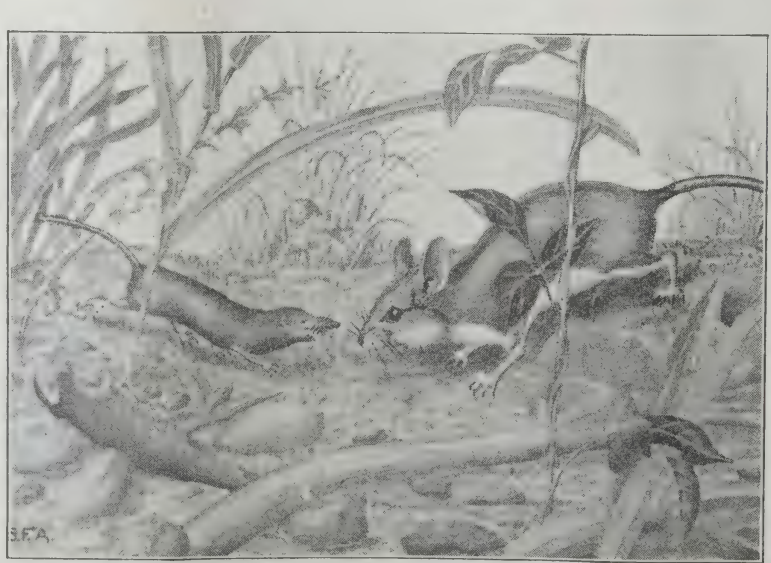
However, the bloody deeds of the creatures that more commonly come to our attention, because more easily if not nearly so often observed, are sufficient to satisfy that interest in savagery inherent in the most gentle minds. No matter what may be our somewhat enforced and surely meritorious opinions of prize fights, bull fights and the like, most of us cannot break away altogether from an admiration of superior strength and the heroism of the conqueror. And with this comes a persistent gloating over a brave and effective defense.

The sanguinary successes of the puma upon deer fully the size and weight of the big cat, the attack of a giant bear on young cattle with the horns of the leader threatening bruin, the forays of a lone bobcat into a bunch of sheep, an eagle's like-mindedness with regard to lambs or its daring to invade the congregation of strong-winged geese, the wolf and the jack rabbit, the fox and molly cottontail, the mink and the muskrat, the pekan and the porcupine, the weasel and the squirrel, the shrew and the mouse, are all, proportionately, nuts to our mental crackers.

However lacking in interest these instances may be as they come down the scale, it must be confessed that as the size of the blood seekers is reduced the sanguinary tendencies are increased, so that with the weasel and the shrew the fighting insects are almost equaled.

Few of the birds—always excepting the great horned owl which may be likened to the bobcat among feathered folk, and the shrike, winged representative of the weasel—show exceeding bravery in attacking creatures greater or equal in size and strength. Some hawks are very bold.

The before-mentioned peregrine falcon must get an advantage over equally powerful wings when it rips open the back of a waterfowl. There is on record, probably authentic, an instance of a great horned owl evidently mistaking a mink digging in the snow for a rabbit, seizing and wounding it, but being in turn quickly dragged down and killed.

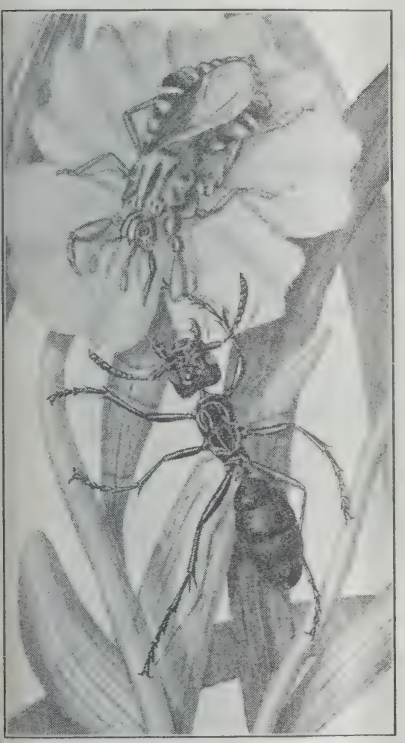


Less credit for daring should be given to those creatures especially endowed by Nature for capturing and killing their prey. The claws and fangs of the cats, the talons of the rapacious birds, the bill of the shrike give superiority over those animals possessed only with the desire to kill. Many of the killers are endowed with blood lust alone. Thus the mink, except being a little larger, should have small advantage over a rabbit, and the largest weasel none; though the cottontail is so timid that when seized by stealth he can only struggle to get away. If he dared to use his pincerlike incisors, applying to such an effort all his strength and agility, the killers would respect him. The weasel has a similar but less marked advantage over the gray and fox squirrels, and there have been incidents where the latter, cornered, have defended themselves so well as to drive the would-be assassin away. There is little credit given among experienced woodsmen to the stories of bobcats attacking deer; if such instances occur they mark the greatest evidences of bravery on the part of a predatory creature attempting to prey upon an animal very much larger. But cases are cited of the lynx attempting to reach a fawn and being defeated by the agile and sharp-footed doe.

There seems to have arisen within the valiant breast of the Cooper's hawk a bitter animosity toward the chanticleer, especially if the latter be white or brightly colored and decidedly alert in the defense of his harem. I have heard of many cases of this winged assassin passing over a flock of chickens out of which it could easily have picked a delectable victim, and making a direct dash to close with the feathered boss of the barnyard. This nearly always resulted in the quick death of the corn-fed fellow.

I know of one case, however, almost the reverse: the falcon attacked a pit game rooster, and as the terrible talons found their hold in the neck and breast of the defender, the blow of the long spurs disabled and brought the aggressor to earth where it was dying beside its expiring victim when picked up by the farmer's boy.

The winged attacks of swift hawks upon larger and by no means defenseless herons, bitterns and giant grouse—often intended and witnessed in the days of falconry—show no small degree of courage, although for the most part the attacks are made from above, the quarry being unable to make an adequate defense. It is well known that no lone hawk, nor even eagle, will attack one of the larger herons on the ground, fearing a blow from the sharp lance-like beak.



Owls are not second to the hawks in boldness, although they have the night to cover

Deer mouse, about to enter its burrow, attacked by a long-tailed shrew.

their assassinations, generally attacking diurnal creatures at rest. The great horned, the barn, the snowy and, perhaps most notably, the barred owls, are abroad as much in daylight as at night, although they make their forays on the hen roosts mostly after dark. The killing of large chickens, ducks, guinea hens, young geese and turkeys, and wild birds of equal size, is not uncommon among the larger species, while the little screech owl, bravest of its race, may attack partridges, rats, squirrels and even poultry.

The weasel's bloodthirstiness and daring surpass that of all the true Carnivora; the little creature will not only seek to attack the timid hare and pursue the fleeing squirrel, but it will sometimes succeed in cutting the throat of a wild goose, a fair blow from the wings of which would disable the quadruped. When very hungry, weasels have been known to seize and hold

A blood-sucking ambush bug has seized a carpenter ant, but there is an even chance that the bug will be killed before its lance-like probosis can be used effectively.

for a time young woodchucks. Even the fox and the raccoon respect full-grown woodchucks.

Bravest of all the backboned animals are the smallest quadrupeds: the shrews. Here is a degree of daring that may be partly the result of ignorance, for these tiny creatures at times expose themselves to the possible attack of numerous foes, such as owls, hawks, shrikes, weasels and minks. Shrews seem to know nothing of retreat, unless receiving a hurt from the teeth or claws of a cat, or the sharp bill of a grouse. Not unfrequently, aided by their deterrent odor, they will bite the feet or lips of a cat so as to cause it to retire a little; they will bite a person's shoe, refusing to retreat to cover close at hand, and probably having no sense of the size or prowess of an aggressor. A shrew would nip an elephant's toes if placed beside it.

Into the burrows of mice twice its size and strength the smallest shrew will boldly crawl, and without hesitation, as proved when the two have been caged together, will attack and often kill the rodent.

# The Fallacies of Philanthropy

(*Concluded from page 7*)

lief that a man can write a check and give it to an official of a philanthropic organization, and that then the interest of the contributor will be effectively expressed to, and understood by, the beneficiaries.

If all the philanthropic organizations had succeeded, there would be in this country today few hungry people, less illiteracy, virtually no underdeveloped bodies, few defectives, no homeless orphans, no indigent widows, no preventable accidents or disease, no unhappy homes, and no war. In place of this ideal condition, we find that the poor are still with us, many of them ignorant and diseased, and the crime wave has become such a deluge that three billions of dollars are stolen yearly in America. Philanthropy increases, but the conditions it tries to eliminate seem to increase faster.

***Organization Does Not Express Ideals***

Philanthropy has given America some of her noblest institutions, but in most of these there are fallacies. One of these is the false idea that the machinery of organization can express the ideals of the man who provides the funds.

Organizations come to depend upon printed matter, lectures and other impersonal contacts with the beneficiaries. If printed matter could solve the problems of humanity, they would have disappeared long ago.

In the Y. M. C. A., it is assumed that boys are kept off the street and that they absorb the ideals that the organization represents. Records kept in one of the best of these organizations revealed that both assumptions were fallacies. Only ten per cent of the members used the building as often as three times a week. Ten per cent never came at all after paying their membership fees. The pool tables developed a group of youthful "sharks" who introduced every gambling practice known to the public billiard parlors. Only constant vigilance kept them from gambling openly, and money changed hands outside. The strong athletes yielded the gymnasium floor unwillingly, if at all, to boys who needed exercise. Instead of absorbing the philanthropic ideals of the founders and contributors, some beneficiaries exhibited every form of selfishness.

The director had too many boys to handle, as all of his kind did. It is futile to suppose that one man can make the ideals of any organization effective in the lives of 400, 200 or even 100 boys, under such conditions. Charlie Chaplin and Bill Hart seem to have more influence on boys, such as it is, than all the welfare workers combined. It may be because they are given the opportunity to put thirty days of work, if necessary, into thirty seconds of a photoplay as seen on the screen. Incidentally, they seem to make about as much money as all the welfare workers combined.

***Inconsistencies in Organized Philanthropy***

The public holds to some fallacies in a way that hinders intelligent philanthropic work. One is that, because it is more blessed to give than to receive, a lot of small change should be dropped into the tin cups of street beggars. A man who investigated 36,000 cases reported that he did not find one in which the beggar needed the alms. Another illusion is that persons who beg from door to door must need help or they would not descend to that method to secure it. Most of these beggars are professionals, according to investigators, and they have all their donors carefully classified.

Philanthropy finds it difficult to adjust itself to some situations. No sympathy can be aroused for the children of the rich, though many of them are among the neediest of our little ones. The poor we have always with us, but we do not like them to be too near. We cheerfully resign them to professional charity workers. The people of the slums avoid some of the institutions that they might use with profit. Only those who have lived among them know how certain of the poorer class shrink from a marble building and from the hearts of the same material that sometimes are found there.

There are some glaring inconsistencies in organized philanthropy. The Y. M. C. A's main argument in soliciting money has been that it aims to develop Christian character. Psychologists pointed out long ago that the time to shape character is when the boy is just coming into manhood, yet it was a long and at times almost disheartening struggle to induce the Association officials to give adequate space or leadership to boys. Even yet the best parts of some Association buildings are used by men far beyond the impressionable, character-forming years, and the boys have only what is left after the men are provided for.

***Where the Boy Scouts Fall Short***

The Boy Scouts of America has as its major aim the preparation of boys for participating in citizenship, yet it has concentrated so strongly on activities for boys from twelve to fifteen years of age that ninety per cent or more of the Scouts escape from its influence before they reach voting age.

If strong and virtuous civic leaders do not usher boys into constructive, participating citizenship between sixteen and twenty-one, the crooked politicians will. None can avoid participation, for neglect of civic duty has a strong effect upon the affairs of every community, state and the nation.

It is difficult to measure the results of philanthropy, especially when depending upon the reports of interested persons. Statistics may be impressive and worthless; or they may be full of errors and still show results of the highest value. One thing we can be sure of, however: intelligent neighborliness that radiates warmth and good cheer is as certain to produce results as the fire that burns beneath the boilers of industry.

A check written to get rid of an importunate official of a philanthropic organization may dissipate its energy in turning the wheels of the organization. Investigators are finding a good deal of duplication and lost motion in philanthropies that have stood high in the public esteem. But the encouragement of one man by another in whom he is able to find an example worthy of emulation always helps both.

This glimpse of the seamy side of philanthropy is given in the hope that the genuineness, the common sense and the thoroughness with which small-town neighbors take care of real needs as they arise may be applied to the work of organized philanthropy and drive out the fallacies.

# Kodiak Legend

IN KODIAK legends, Shliam Shoa was the one supreme god who created the heavens and earth; but of light there was none.

From among his innumerable attendants and subjects were two creatures of singular beauty and loveliness. These two, a human boy and girl, he placed in the choicest of his dominions, with the single reservation that they should not eat of the grass with which their new domain was so richly carpeted.

From the first the girl was consumed with curiosity, and said to the boy, "Let us eat of the grass. What harm can follow our act? Shliam Shoa will never miss what we eat from the abundance around us."

But the boy demurred and urged her to desist, saying they should be satisfied. The girl, however, grew restless and dispirited and would not talk.

Her unhappiness made the boy miserable but he stoutly maintained the wrongfulness of disobedience, until she told him she would never sing or even speak again unless he joined her in eating of the grass. Then he submitted and they both plucked of the grass and did eat thereof.

And at once the first dawn broke in the eastern sky, flooding the whole land with its radiance and exposing to them their complete nakedness. Much ashamed, they quickly fashioned garments of the feathers of the eider duck to clothe themselves.

When Shliam Shoa came to visit them he was so enraged that he drove them out into a region where they could have nothing except at the price of hard labor. They tried to get back but the door was bolted and barred.

At length a baby was born and then another until five had come. Then the five died suddenly and the parents were wild with grief. Shliam Shoa appeared and asked: "Why do you grieve?"

They replied: "All children born to us die."

"Grieve no more," said Shliam Shoa, "for I will sing you a song and all your children thereafter will grow strong and multiply and cover the whole earth. And they shall pay me tribute of one skin of the fur seal each season, and shall live long and find good hunting, and there shall be continuous joy in all the igloos and barabaras of your children."

And thus the children of Kyktag, the first man, peopled the earth.

But after a time the payment of seal skins to Shliam Shoa began to be neglected and finally were entirely refused by all save Kyktag and four of his sons who lived with him; the delinquent children asking: "Why should we pay tribute for that which is ours?"

Shliam Shoa was much enraged and told Kyktag that he would send the waters of the sea to cover the whole land and drown every living thing dwelling upon it. Thereupon Kyktag built a huge bidarka and stocked it with meat for a year. When Kyktag and his wife, Unalakleet, and the four obedient sons and their wives had embarked in the bidarka, the tides rose above all former levels, drowning all but Kyktag and those with him.

After many days the aliak (flood) subsided and the bidarka grounded on Kodiak Island. Then Kyktag sent off his four sons, one to each of the four points of the compass, to multiply that the earth might again be populated.

# A Dance A Week

## THE RIPPLE

This dance is a smooth, gliding movement. It is composed of two slides to the left side and a step backward with the left foot; and two slides to the right side and a step forward with the right foot. Count, 1 and 2 and 3—1 and 2 and 3. In first movement, gentleman makes backward step with left foot, lady makes forward step with right foot. When gentleman makes forward step, lady makes backward step. The movement is that of a rhythmic ripple.

### THE DANCE

Waltz position.

Left foot to left side—*slide*, and *slide*, and *step backward:* count 1 *and* 2 *and* 3 (1 bar).

Right foot to right side—*slide* and *slide*, and *step*, forward: count 4 *and* 5 *and* 6 (1 bar).

Repeat all, until the dance is ended. These same steps may be danced forward in a straight line if desired.

### ANOTHER VERSION OF THE RIPPLE

Execute the *step* first, and the *two slides* last. The count is the same.

Step back upon left foot; count 1.

Take two slides with the right foot to the right side; count *and* 2 *and* 3 (1 bar).

Step forward on right foot; count 4.

Take two slides with the left foot, to the left side; count *and* 5 *and* 6 (1 bar).

Repeat all. In this version start the turn on the first and fourth counts.

## THE NEWPORT

Metronome 92 ¾ Mazurka

Waltz position.

Gentleman step back on left foot, count 1.

Point right toe to right side, and close left foot to right (weight on left), count AND 2.

Point right toe to right side, and again close left foot to right (weight on left), count AND 3.

Repeat with right foot forward.

Step forward on right, count 1.

Point left toe to left side, and close right foot to left (weight on right), count AND 2.

Point left foot to left side, and again close right foot to left (weight on right), count AND 3.

Repeat all.

NOTE. The difference in the steps of the Ripple and Newport. The former dance is *two* slides and *one* step. The Newport is *one* step and *two* point close movements. The count is the same. The transfer of weight in the Newport is made only on the first count of the measure. In the Ripple there is a transfer of weight on each beat in the measure. The same music may be used for both dances, but should be played a little faster for the Newport.

## THE THREE STEP

Waltz position.

The dance is a slow, smooth, gliding movement, with a step to each beat.

The step is *slide, close, step*. There are many combinations of steps used in the dance. The following is a popular version of the *Three Step*.

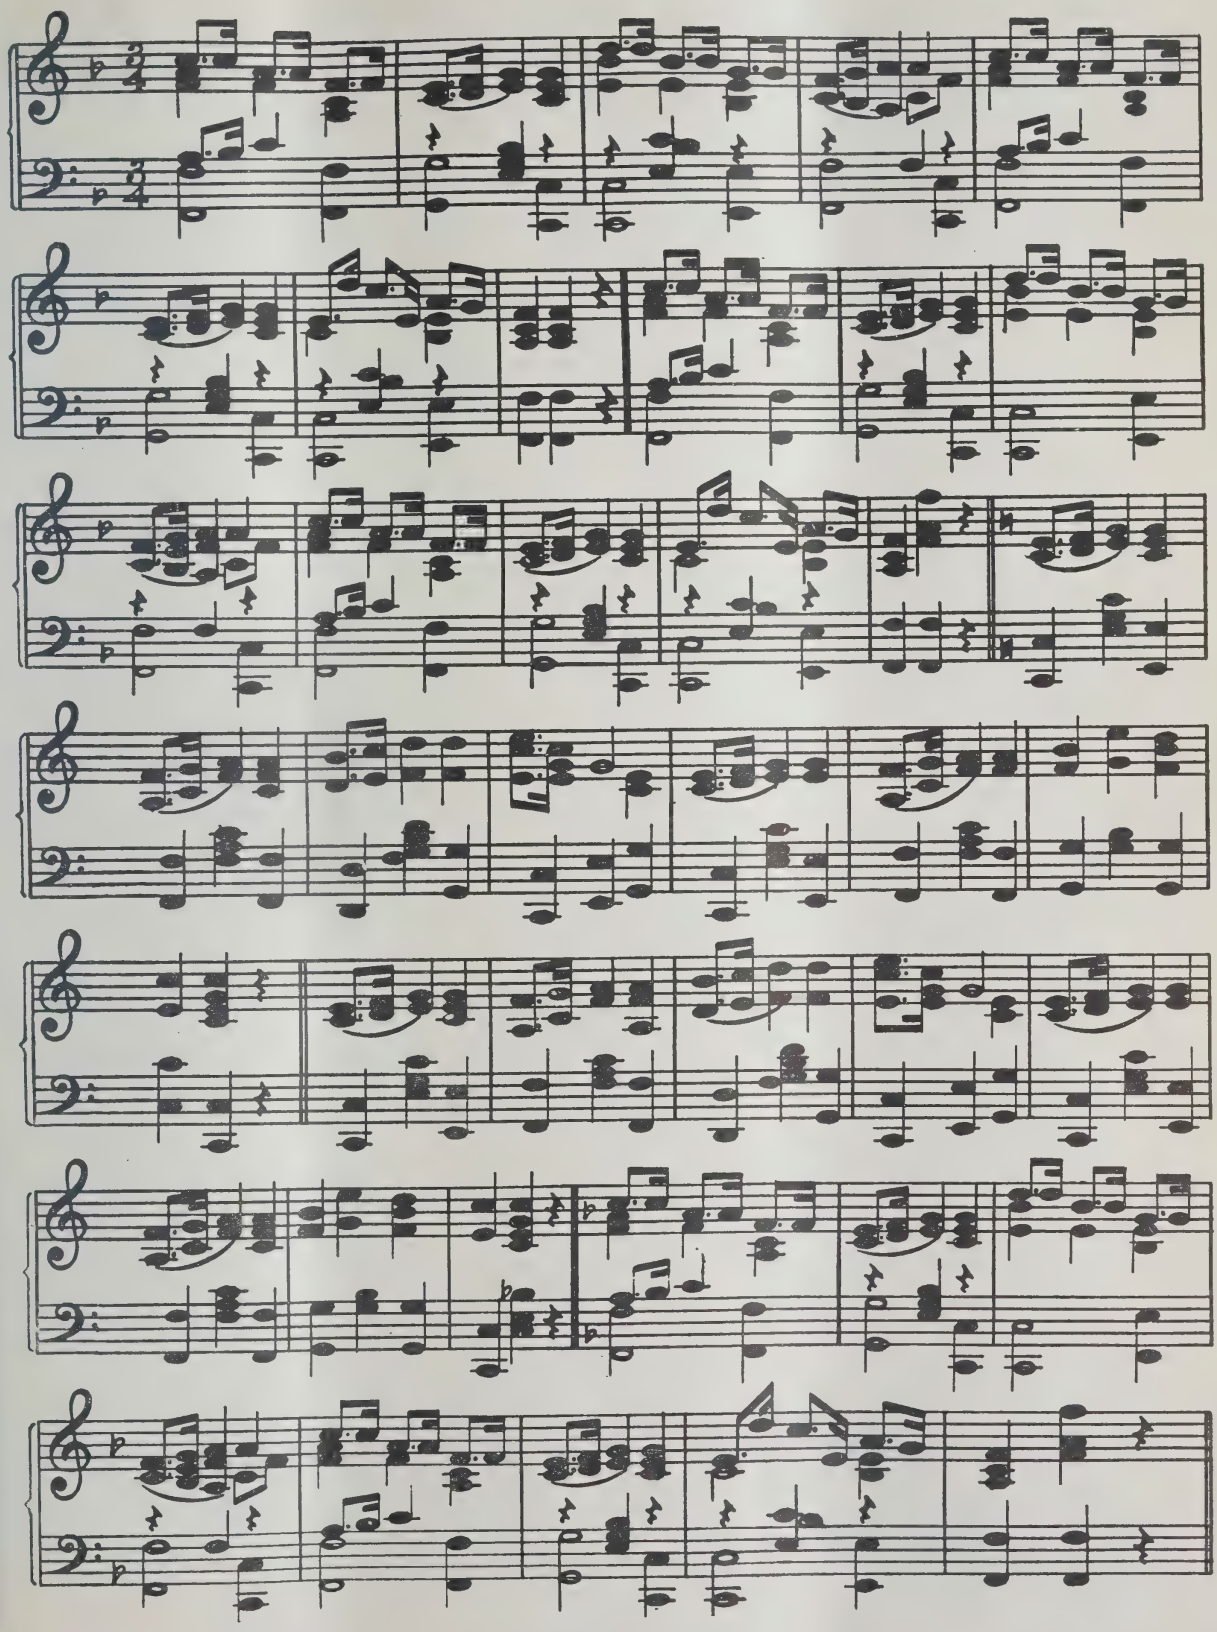
Slide left foot to the left side; count 1

Close right foot to left; count 2

Step back on left foot; count 4

Step back on left foot; count 3 (1 bar)

Slide right foot to right side; count 4



Close left foot to right; count 5

Step forward on right foot; count 6 (1 bar)

IN the end of the Sabbath, as it began to dawn toward the first day of the week, came Mary Magdalene and the other Mary to see the sepulchre.

And, behold, there was a great earthquake: for the angel of the Lord descended from Heaven, and came and rolled back the stone from the door and sat upon it.

His countenance was like lightning, and his raiment white as snow.

And for fear of him the keepers did shake, and became as dead men.

And the angel answered and said unto the women, Fear not ye: for I know that ye seek Jesus, which was crucified.

He is not here: for He is risen, as He said.

—Matt. 28:1-6

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week discusses the great assistance which the "wets" are giving to the "dry" cause.

This generation of youth is no worse than its predecessors—nor as bad. It knows more—it should. "Why she knows more than her mother did at her age!" Mighty good thing she does. Knowledge is protection. We older ones think of some kinds of knowledge as a stain—probably because ours came that way. Some people have a knack with bad boys and can bring them around. Other people, lacking the knack, should keep hands off. Surprising how things right themselves when the nagging ceases. Nagging begets irritation and resistance. Here is the story of a bad boy. (p. 8)

You heard the common slander on your Government, but did you resent it? No—because you did not know how. They said your Government was cruelly keeping immigrant families apart. They told you sob stories of poor people separated by our cruel immigration laws. Our laws are known beforehand by every immigrant who comes and *he separates himself from his own family—he* does it, *we* do not. And his family can come in their quota. We resent the lying slanders heaped without rebuke upon the considered laws of the United States. Read the truth about it. (p. 22)

Everybody used to "eat with his knife," that is, convey food from plate to mouth by means of the knife. An "Office Chat" tells you why. (p. 21)

Most of us have seen enough pictures of mountains and castles and cathedrals; we want to know how to live when we get to London and Paris. Notice the "we." Even school-kids go abroad now. Student tours, 36 days, $365, put foreign travel within everyone's reach. You remember Mr. Dillon's article, "I Rented a House in England," in our March 13 number. Here is another of the same kind—"Housekeeping in a Paris Flat"—with everything you want to know, very entertainingly told. (p. 3)

PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer; C. B. Longley, Secretary; W. J. Cameron, Editor.

Wilson and Roosevelt were bitter enemies, but Wilson had himself better in control. What each man said in private of the other never bore printing. But Wilson's rapier was more than a match for the Rooseveltian Big Stick, and the Colonel never got the open fight with the Governor which he sought. Here is some inside information as to how the two men handled each other behind the scenes. (p. 2)

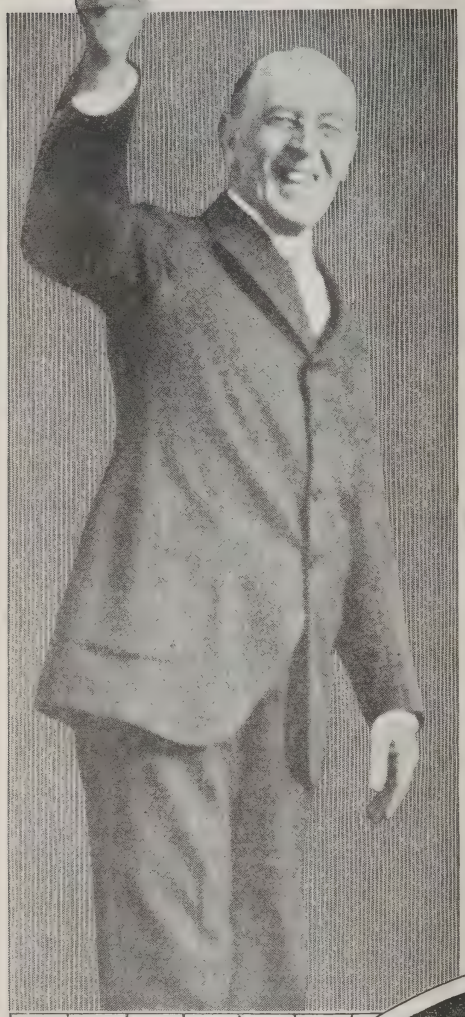
There is one item in the high cost of living from which we are exempt; but they have it heavy in China—the cost of ancestor worship. Of course, we owe all to our ancestors, but in China they *pay it*. Funerals are as fatal as famines in sweeping away the resources of whole families, so great and costly is the esteem that must be given to the dead. This is an article direct from China by a woman who knows the country and loves the people. (p. 16)

An Irishman asks, "Why this union of Jews and Irish in *Abie's Irish Rose, Kosher Kitty Kelly* and *Hogan's Alley?*" Read his remarks in "Office Chats." (p. 21)

As an interlude in the prohibition squabble, Dirk P. DeYoung rises to inquire "Are We a Nation of Coffee-Bibbers?" We here in the United States consume half the coffee output of the world. At that we average only one cup per capita, per diem. If all the world had a cup a day, there would be an enormous coffee shortage—90 per cent of the world would go coffee dry. Our forty-million cups of coffee may be Mocha or Java or something else by name, but it is mostly all South American. There is no coffee publicity in the writer's statement that coffee moderately used is not injurious to health. We let the statement stand because the exception is probably one in half a million. There may be immoderate coffee drinkers, but a cup a day for each American hardly proves us to be immoderate as a nation. (p. 19)

Out of every great career, little careers trickle on their way, each with its own interest. What, for example, was the later life of the man charged with complicity in the assassination of Lincoln, John H. Surratt? His mother was hanged for the crime, but he escaped. What befell him between that time and his death in 1916, would make the most thrilling fiction were it not the unadorned truth. The author is F. L. Black, whose research into the myth of John Wilkes Booth's escape and survival is so well known. (p. 14)

Golf—what a wallop that imported word is coming to have in America! It sounds like the first breath of spring and carries in it the magic of summer and the golden light of long fragrant autumn days. It seems that American golfers are challenging the world. (p. 12)



Is President Coolidge changing his mind about European affairs? It looks like it. Events are now proving the arguments of those who said that the World Court was a League bait. Read the Editorial—"The President Sees and Speaks." (p. 10)

## His Passion for Accuracy Conflicted With Newspapermen Who Ignored Serious Things to Ask Him "What He Ate for Breakfast"

PART III.

By HUSTON THOMPSON

UPON more than one occasion in the 1912 campaign, Woodrow Wilson labored under an unsuspected strain which taxed his wonderful reserve of patience and forbearance to the limit. Like the mythical hero of Rudyard Kipling's *If* he restored his fighting nerves with the thought in the two lines:

"If you can wait and not be tired by waiting,
Or being lied about, don't deal in lies."

Mr. Wilson was shocked at the newspaper interpretation of his candidacy. As the campaign got under way his feeling grew from surprise and disappointment to indignation and disgust. His whole life had been studious and methodical. He was also distinctly thorough. Instead of his passion for accuracy, especially for accuracy in statement, decreasing as he entered political life it grew more meticulous. Confronted by any new problem he devoted himself to it conscientiously, got together all the facts pertaining to it, and then thought it out to a logical conclusion. Such was his attitude toward his duty as a candidate for President. He was tremendously serious about it. He felt the weight of a great responsibility and did everything in his power to treat it as such.

But the newspaper correspondents wanted to know what he ate for breakfast!

He believed that the country was preparing for a "solemn referendum," and his disgust was immeasurable when, after delivering what he considered an important address on some vital, economic issue, he would pick up a newspaper and read that: "Wilson rides in seat thirteen."

Above—President Wilson snapped in a moment of action at St. Louis on his trip around the country. Oval—Inauguration of President Wilson, surrounded by the familar faces of a number of governmental notables.

In an address in New York on one occasion he was discussing public opinion. He said it did not originate in large cities but in the small towns, on the farms, in the valleys and mountains where people had time to think. Turning aside playfully from his theme he humorously said:

"Public opinion in America comes from the crossroad store, where men sit around the stove on a winter evening and spit into a sawdust box; and whatever else may be said of the habit of chewing tobacco, this much must be said in its favor: It makes men think because they have to stop between sentences to spit."

He was horrified to discover, the next morning, that the newspaper reports practically ignored the serious part of his address but proclaimed to the world in headlines that "Chewing tobacco makes men think, says Wilson."

But despite his attitude toward the press, he had a dramatic, impressionistic way of presenting a situation that compelled recognition. In the 1916 campaign he produced a remarkable contrast with Mr. Roosevelt, whose name he refused to mention throughout the campaign, despite the latter's frantic references and utterances to draw him into doing so. His impersonal, unnamed rejoinders to Mr. Roosevelt's attacks put the former "Bull Moose" leader in a position similar to a pugilist who shadow-boxes with an invisible opponent.

This method of President Wilson's almost drove Roosevelt to despair. At the same time the reading public, through the press pictures of the situation, was having unconsciously etched upon its mind the picture of an adroit personality that was very persuasive.

It was a rare sight on those beautiful October afternoons in 1916 at charming "Shadow Lawn" when President Wilson, speaking from the front porch of his summer residence to tens of thousands of Democratic pilgrims, would lift that accusing index finger of his right hand, and pointing at an imaginary Roosevelt, answer his latest attack by always smilingly addressing him as "the articulate part of the Republican party."

Apartment on the short rue des Eaux, in Passy, where the author lived.

# Housekeeping in Our Paris Flat

## How Two Americans Fared in the French Capital and "Got to Love Passy"

By PHILIP ROBERT DILLON

I SAID to my wife, one day in London:

"I would advise you to take Mrs. Bindle with us to Paris. I know she would like to keep house for us there, and everyone says that they speak English everywhere in Paris. I feel she could get along in English with the household shopping."

Mrs. Bindle was our English housekeeper, an elderly woman of Devonshire, with all the conservatism of the West-of-England people, who still hold their tradition of superiority to the French that has been handed down from past centuries, particularly from the time of the Napoleonic Wars. She was a competent cook and manager in the English way, and had managed our house in Somerset three months and our flat in London two months with thorough efficiency. She had voyaged to America but never to France. She knew not one word of the French language.

Mrs. Bindle agreed to undertake the adventure, and indeed it was a great adventure for the three of us, to plunge into housekeeping in Paris for a six-month stay, not knowing the city nor the language. My own French was of the theoretical sort learned in school years ago. But our traveled American friends had said: "English is spoken everywhere in the world, now," and we had swallowed that comforting statement.

So we three arrived at the *Gare du Nord* in Paris, one sunny day in November, and went to a small hotel near the Madeleine, temporarily; and four days later installed ourselves in a flat in the rue des Eaux, in the section called Passy.

Our English friends in London had said to us: "Don't go to the Latin Quarter to live. It is not nice. Go to Passy. You will love Passy!"

These English friends were successful business people who lived in a large handsome house at Sydenham, London. It is essential that successful business people of London should live only in certain sections of London which are recognized by society leaders as proper residence sections. We found out later that "successful" business people of Paris live anywhere they like, many of them in unfashionable sections, and the place of residence in Paris doesn't make nearly so much difference, socially, as it does in London, or even New York.

It is generally true that a river running through a city divides the inhabitants socially. This is true of London; the people north of the Thames patronize and poke fun at the people on the south side. New Yorkers in Manhattan for a century have assumed airs of superiority over the people of Brooklyn across the East River. The rule holds good in Chicago. Paris is an exception.

The river Seine flows through the city in an arc from east to west, about two-thirds of the territory being on the right bank. The Latin Quarter is on the left bank. Also on the left bank is the old St. Germain quarter, the most aristocratic city quarter in the world for two centuries. Here lived the old noblesse of France. Their palaces are still standing, and many of their descendants still live in that quarter. The land is low along the riverside.

About fifty years ago began the movement of the rich nobles and the *nouveau riche* to the heights at the western side of the city; to Passy, Auteuil, Neuilly, on the right bank adjoining the great park called Bois de Boulogne.

Yet the left bank still holds on socially. Myron T. Herrick, the American ambassador, lived there, near the tomb of Napoleon, until this year when he moved to the new American embassy in Passy on the right bank.

And it must not be forgotten that the University of Paris is on the left bank, and also the Luxembourg Gardens, one of the beauty spots of the world, and the parliament of France —both the Chamber of Deputies and the Senate.

But, when one does not know a city, it is well to take the advice of eminent *bourgeois* friends. It is always safe. Only the sophisticated may move at once into a bohemian environment, such as the Latin Quarter. So we went to Passy, and it is true that we did get to "love" Passy.

I went first to an English real estate agent, the best known in the city. "I want a furnished flat in Passy," I said, "three bedrooms, drawing-room, dining room, kitchen, and bath; central heating and elevator."

"How much do you want to pay?"

"Twelve hundred to fourteen hundred francs a month for six months" ($60 to $70 a month).

He looked at me scornfully and closed the book, saying: "We have nothing less than 2,500 francs a month."

I went to a French agency in Avenue Champs Elysées, a large concern where not one of the personnel spoke English.

Yes, they had furnished apartments, "four pieces" for as low as 1,600 francs on the left bank, and three such in Passy for 1,800 francs a month.

Mrs. Bindle came in from her marketing with her face beaming.

The obvious thing to do was to go and look at the rooms.

I paid fifty francs registration fee and signed a paper agreeing to pay in addition ten per cent of the first month's rent if I completed the lease. The landlord would also pay the agency a commission on his part. Then they gave me the addresses of three apartments in Passy.

The second one I visited was in rue des Eaux. Here I made the pleasing discovery that a "four piece" apartment in Paris means actually six rooms and sometimes seven. The kitchen and small bedroom for a domestic servant are not counted as "pieces," nor is the hall which may be bigger than the kitchen, nor the butler's pantry if there be one.

This apartment in rue des Eaux was on the ground floor in a six-story building with elevator. It had a large entrance hall, large *salon* (drawing-room), dining room, kitchen, two large bedrooms and one small bedroom, large bathroom, and many closets. There was steam heat and a fireplace in each of the "pieces." There was electric lighting, and in the kitchen was a combination stove for both gas and coal

The *salon* was handsomely paneled in mauve. The furnishings of the entire apartment were sparingly elegant, though worn. The china was sufficient, with a slight tendency to elegance. Only the cutlery was inferior, being of commonplace steel and showing that it had been sharpened by the grinder for many years. I again regretted, as in England, that I had not brought our own table silver with us from New York.

Blankets and quilts were upon the beds, but no linen, nor was there any table linen. We found that it is the rule in Paris that the tenant shall furnish the linen and silver, but exceptions are increasing and probably landlords will eventually furnish linen, and perhaps silver. We hired our linen by the week from a concern which specializes in that business.

I accepted the flat and so informed the *concierge* (the superintendent or janitor who has charge of a building and who is almost always a woman). She spoke not a word of English, nor did the landlord.

Next day I returned and signed the lease, which the landlord's lawyer had prepared. I found that the price of the flat was 1,825 francs a month. I asked the *concierge:* "What is the extra 25 francs for?"

"It is for the renting agency," she said.

So the landlord made me pay his part of the agency commission, as well as my own, and two months' rent in advance.

Then we took the inventory, the *concierge* and myself, noting every crack in every dish, and every spot in each curtain, carpet and rug. On the day we left, six months later, we again took the inventory, and I had to pay for every additional crack and spot and bruise on the furniture. These extra cracks and spots cost me about fifteen dollars.

Thus the rent and charges, not including the *concierge's* monthly tip nor the breakages of china, amounted to approximately $100 a month.

We had paid Mrs. Bindle in England 18 shillings a week (about $4.00) which was higher than the prevailing wages. We translated this into French money and continued her wages at 85 francs a week; the prevailing rate at Paris a year ago for what is called a "general" in England and is called a "maid to do all" (*bonne a tout faire*) in France, was 240 francs a month ($12.00).

It was borne in upon us crushingly from the first day that if you want to keep house in Passy without any knowledge of French, you must be prepared for misery. We hunted the neighborhood to a distance of half a mile for any grocery, butcher shop, bakery, vegetable shop where they spoke English. Not one could we find. Several drug stores displayed the sign "English spoken." Later we found out that one ought to take such signs with a grain of salt.

Mrs. Bindle was panic-stricken. At first I went with her to buy our groceries, and gave her lessons in French money. Later she would go alone to the nearest shops and would manage to get things by pointing her finger at them as they lay or hung in the shop. I gave her a small book in which the shopkeepers would write the names of the articles purchased, the quantity and the price, all in French.

After a couple of weeks she had mastered the rudiments: That a kilogram ("kilo" for short) is 2 pounds, that a litre is about a quart. She never grasped the hectogram ("hecto" for short) which is one-fifth of a pound, nor the metre nor any other French unit of lineal measure. Fortunately, the French still use the term "livre" (pound) and mark the price of meats and vegetables very often by the "livre." Mrs. Bindle pronounced it liver, just like the liver of "liver and bacon," and got to know it was a pound. The French pronounce it almost like the last syllable in "believe."

One day Mrs. Bindle came in from her marketing with her face beaming and she burst out in delight, "I have found a lovely American lady. She lives near here."

She related how she was in a grocery shop trying to buy spices and things that were not in sight while the shopkeeper was shaking his head hopelessly, not understanding her, when a lady who was waiting to be served, spoke in English and vol-

# Never Separated a Single Family

## Open-Door Immigration Strategists Slander the United States Government

By KENNETH WATSON
DRAWING BY W. W. CLARKE

THE "melting pot" of the United States is perilously near boiling over again!

Up to March 1, a total of 67 bills designed to modify the immigration law had been introduced in the House of Representatives alone, and many more in the Senate. With two exceptions all seek to amend the act of 1924 so that various classes of aliens may enter.

An idea of the enormous increase that would follow if all the "open door" policy bills were enacted into law is gained from often repeated statements of Representative Albert Johnson, of Washington, chairman of the House Immigration Committee, and one of the leading authorities on that subject in the world.

"If all the various proposals intended to modify the law were to be adopted, five million aliens could enter," is Johnson's startling announcement.

Not all this tremendous influx would come at once—the governmental machinery could not handle it. But passage of the various bills would result in a million aliens entering annually.

"The United States would then again be confronted with the same conditions which led to the passage of the 1924 law," Johnson says.

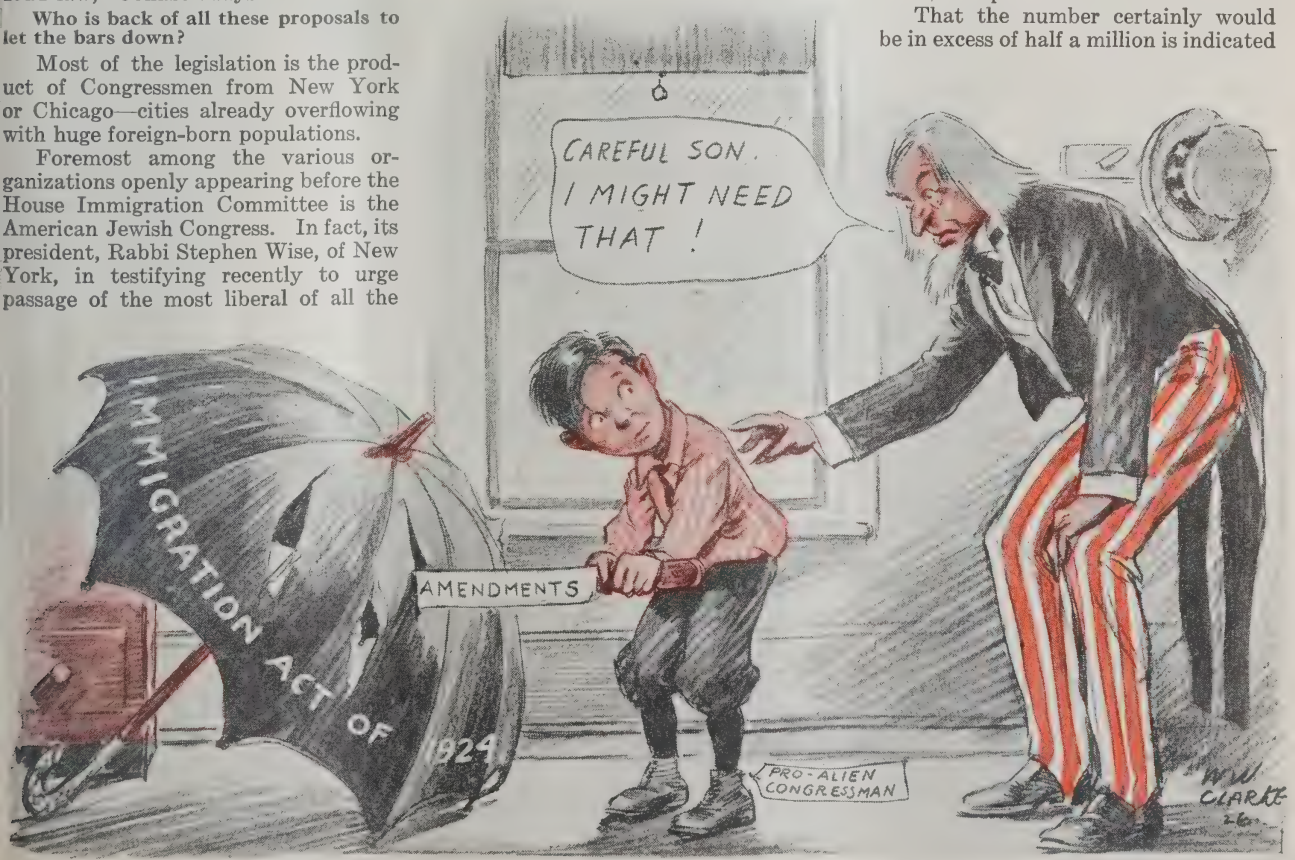
**Who is back of all these proposals to let the bars down?**

Most of the legislation is the product of Congressmen from New York or Chicago—cities already overflowing with huge foreign-born populations.

Foremost among the various organizations openly appearing before the House Immigration Committee is the American Jewish Congress. In fact, its president, Rabbi Stephen Wise, of New York, in testifying recently to urge passage of the most liberal of all the liberalizing measures—the Perlman bill—boldly accused Congress of being a divorce court which is keeping thousands of aliens from joining relatives in the United States through its action in passing the 1924 law.

"Whom God hath joined together, let no Congressional enactment rend asunder and keep asunder. After all that is exactly what has been done," Rabbi Wise dramatically exclaimed.

The Rabbi and other witnesses, including Carl Sherman, chairman of the legislative committee of the American Jewish Congress, and Rowland Mahany, former solicitor in the Department of Labor, asserted that the quota provisions, which they claim are preventing the uniting of families in the United States, are inhuman.



Sweeping changes which would liberalize the immigration law to a greater extent than even under the conditions immediately following the World War are contemplated by the Perlman bill, introduced by Representative Nathan Perlman, of New York City.

At present *wives of American citizens* and *alien children under 18 years of age* are exempted from the quota provisions of the law. Representative Perlman is endeavoring to *raise the age limit to 21 years* and to provide further that not only *wives* of citizens, but their *fathers and mothers* as well may enter outside the quota provisions.

Perlman further urges that the same privilege of entering beyond the quota be extended to the same category of relatives of any honorably discharged veteran of the American military or naval forces in the World War. Not content with thus liberalizing the law, Perlman also stipulates in his bill that all aliens legally admitted to the United States prior to July 1, 1924, who have declared their intentions even of trying to become American citizens, shall be entitled to bring in the same class of relatives outside the quota.

Just how many aliens would be added annually to our alien influx if the Perlman bill passes is problematical. Supporters of the measure place the number as low as 40,000 to 50,000 annually, but many Congressmen contend the migration would reach more than a million aliens a year in addition to the 164,667 permitted to come in under the quota.

That the number certainly would be in excess of half a million is indicated

by incomplete, but official, estimates prepared by American consuls abroad and telegraphed to the Department of State in response to a request made by Representative Johnson.

The Immigration Committee chairman had asked Secretary of State Kellogg to have the consuls in countries affected by the quota law prepare estimates on the number of relatives in their districts who would be admissible to the United States if the Perlman bill were enacted.

On February 24, after partial returns had reached the State Department, Assistant Secretary Wilbur J. Carr advised Johnson that the number of such relatives was already officially estimated at 577,450. More than half of this number, or 350,000, it was estimated, would be able to emigrate from Italy alone.

Other large numbers were reported from most other Southern European nations whose tremendous influx into the United States after the war prompted Congress to "clamp down the lid." These estimates include 60,000 for Czecho-Slovakia; 20,000 from Jugo-Slavia; 15,000 from Hungary; 10,000 from Syria; 8,700 from Russia; 5,100 from Lithuania; 5,000 from Rumania; 1,700 from Greece and 1,000 from Palestine.

Great Britain's total was estimated at 42,700, including Ireland. Other Northern European countries were placed as follows: Germany, 8,500; Norway, 4,500; and the Netherlands, 600.

On March 1, the State Department advised Johnson that estimates just received from other consulates had increased the total number of relatives of our alien population eligible to enter the United States under the Perlman bill to 622,000. Even this estimate is incomplete as numerous consuls have not had sufficient time to prepare accurate estimates.

While this total of 622,000 admissible aliens may not exactly reflect the result of passage of the Perlman bill, it is at least accurate enough to reveal that the number of relatives permitted to enter would be ten or twelve times greater than the maximum estimates given by proponents of the Perlman bill.

### *Congress Is Not a Divorce Court*

The attack made on the present immigration law by Rabbi Wise aroused considerable resentment during one of the hearings on the Perlman bill and precipitated a clash between him and Representative Johnson.

Rabbi Wise had commented on the fact that Perlman has made the claim that $80,000 has been paid into the United States Treasury by aliens for consular visé fees, but that still they were not permitted to enter.

"Let me ask you right now. Congress is accused of acting as a divorce court in putting asunder 'those whom God hath joined together.' Have you any knowledge as to whether parts of families are coming to the United States now within the quotas as advance agents for their families?" Representative Johnson asked.

Rabbi Wise replied that he had no such information.

"You who are expert in the problem of immigration and European history, knowing as you do the economic state of Jews in Russia and Poland and Rumania today, I wonder whether it is quite accurate to describe the immigrant, driven by economic necessity, by social oppression, by racial discrimination, by religious antagonism—that is, driven to this country or to seek admittance to this country, whether it is quite fair to speak of him as the advance agent of his family," he said with considerable feeling.

> *"Don't you know, as a matter of fact, that the immigration law of the United States has never separated a single family?"* asked Representative Holaday.
>
> "I do not know that," Representative Perlman replied.
>
> *"That they all came here voluntarily; that they can return at any time. I notice in this morning's paper that there are 10 ships sailing from New York to Europe. The statement that is generally made, that the immigration law separates families, I seriously object to,"* Representative Holaday declared in no uncertain tone.

"Just exactly as fair as to stand there where you stand and charge that the Congress of the United States is acting as a divorce court," Johnson retorted.

A few minutes later another clash developed. It ensued when Johnson picked up a book written by a French author which described alleged activities of an organization known as the *Alliance Israelites Universale* in inducing persecuted peoples of Europe to migrate to the United States.

"I suppose the public will have to admit that the legislation spoken of (immigration laws) became necessary because of the activities of such organizations, including one called the *Alliance Israelites Universale* from 1860 to 1910 to promote this immigration?" Johnson asked.

Rabbi Wise declared with emphasis that this particular organization had not sought to induce Jews to leave Europe and emigrate to the United States.

Previous to the occasion that Rabbi Wise appeared in support of the Perlman bill the author of the measure also aroused some of the committee members by his denunciation of the present quota law.

Representative William P. Holaday, one of the restrictionists on the Committee, asked Representative Perlman to state in what manner he considered the present law inhuman.

"Because it separates families; because a husband who is here cannot have his children come and join him; because the wife as a citizen of the United States cannot bring her husband here," Perlman replied.

This claim, which is so frequently advanced by persons contending the law is unjust, has been so frequently shattered that Representative Holaday was not long in doing so again.

But quite apart from the perfectly logical argument advanced by the Illinois Congressman that there is nothing to stop reuniting of familes abroad, the fact remains that unless physically, mentally or morally disqualified, *relatives of citizens can join them in the United States.* Possibly the uniting cannot take place this year, but in no admissible cases will the delay be much longer than that period.

Strangely enough one of the other especially determined onslaughts to batter down the immigration barriers came during hearings on one of the two bills which provides for strengthening the present law. This is the so-called Box bill to place Mexico, Canada, and the countries of South and Central America on the same quota basis as European nations. It was introduced by Representative John C. Box, of Texas, another strict restrictionist on the House Immigration Committee, and has a companion bill known as the Bacon bill, drafted by Representative Robert Bacon, of New York, which would apply the quota to Mexico only of the above nations.

Opposition to the Box bill, however, took an entirely different tact than the humanitarian appeal stressed by proponents of the Perlman bill. Here interests seeking a supply of "cheap" labor came forward with the song and dance that "agriculture in the West and Middle West is doomed" unless more labor can be obtained.

The hearings developed the startling fact that beet sugar manufacturers are seeking to break down the strict contract-labor laws, which have been in effect for forty-odd years, in order to bring in thousands of Mexican peons to work in beet fields of Colorado, Montana, Michigan, Ohio, Minnesota, Nebraska, and other Western and Middle Western states.

### *The Matter of the Mexican Peons*

The admission was drawn reluctantly from C. V. Maddux, labor commissioner of the Great Western Sugar Company, of Denver, during the last few minutes of most extensive hearings. Maddux acted as chairman and principal spokesman for a group of the sugar manufacturers and western Chamber of Commerce officials styling themselves as a "group of farmer delegates."

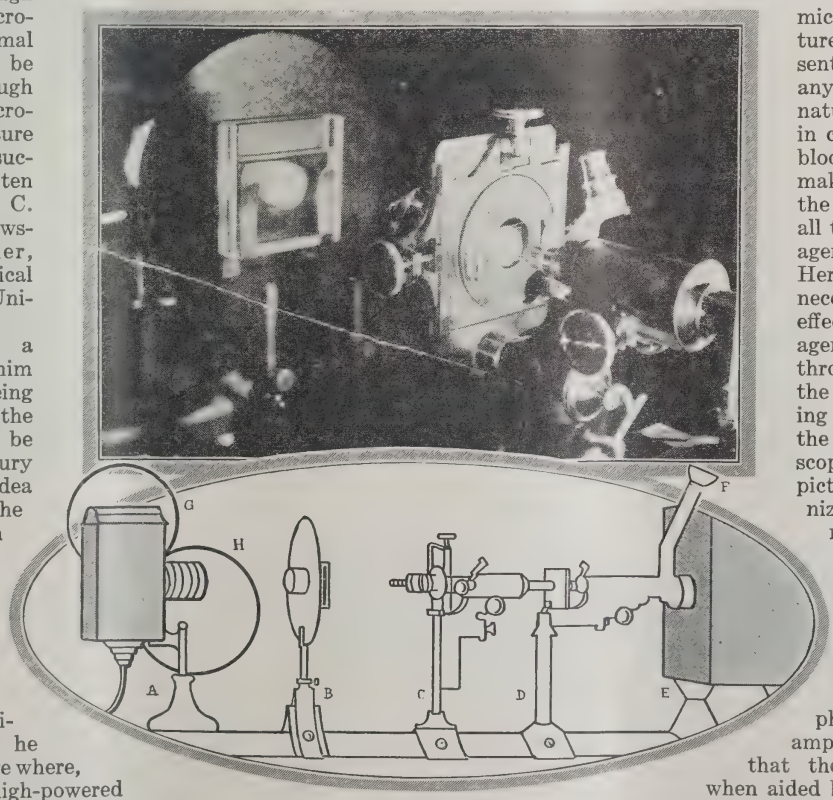
In stressing the needs for agricultural labor, Maddux and every other one of the 30-odd witnesses had been careful not to mention contract-labor. Most of them had been content merely to urge repeal of the $10 visé fee and $8 head tax, which *(Concluded on page 22)*

Sections from the first microscopic motion picture made, showing process of fertilization of a flower by pollen grains. First two panels show pollen grains sending out tubes of protoplasm under influence of the liquid content of the stigma of a flower. The second pair of views shows these tubes well developed, and the third group shows them fully extended.

# Life and Death Act on the Screen

## A. C. Pillsbury Films Bacteria and Pollen in Action; Motion Pictures of Flower Fertilization

By H. H. DUNN



ON A thin glass stage, not more than two inches long by half an inch wide, the tiny germs that produce life, and the even smaller bacteria whose unchecked activities result in death, have at last been compelled to reveal their secrets to man.

Too small to be seen by the unaided eye, many of them moving with such rapidity that the eye wearies and the brain tires after a few seconds of watching them through the strongest of microscopes, these infinitesimal creatures now may be studied at leisure through a combination of microscopes and motion picture cameras brought to success in 1926 after ten years of effort, by A. C. Pillsbury, a former newspaper photographer, working in the botanical department of the University of California.

Men called him a dreamer, warned him that his time was being wasted, and declared the result he sought to be unattainable. Pillsbury doggedly held to the idea that the lens of the microscope, which never tires, and the eye of the motion picture camera, which never wearies, could be brought together to the aid of man in his battle with communicable disease. Now, he has arrived at the stage where, out of a line of high-powered microscopes, the lens of the camera under his direction picks the protoplasm of the pollen grain as it fertilizes the ovary of the flower—in other words, the beginning of life in the vegetable kingdom, an activity never before seen by man.

Through the same lenses, the same camera views and records the movements of the bacilli of typhoid, pneumonia, and other communicable diseases, slowing down their motions, raising their size to that of footballs or yardsticks, as their shapes may be, and it permits the bacteriologist to sit hours at a time watching these emissaries of death, just as you and I watch actors and actresses on the motion-picture screen.

Magnified 110,000 times, these bacteria go through their processes of reproduction, growth, destruction of tissues, contact with blood corpuscles, and, finally and most important, reveal the effect upon themselves of bacteriophages, or hostile bacteria introduced into the glass slide which makes the stage on which they perform.

Above—The stage on which minute living creatures are photographed. It consists of a glass slide in front of the microscope. Oval—Working arrangement of instruments, *A* being a light, *C* the primary microscope and *E* the motion picture camera.

In the making of these microscopic motion pictures it is possible to present the bacteria under any and all conditions, natural and unnatural, in cultures and in actual blood or tissue, and to make lasting records of the effects upon them of all the disease-combating agencies known to man. Heretofore, it has been necessary to study the effect of these remedial agencies with the eye through the microscope, the resulting records being open to error. But the eyes of the microscope and the motion-picture camera, synchronized in this new process, never err. What the bacteria do, that the camera records, literally picking the picture out of the eyepiece of the double-microscope. The bacillus of typhoid fever, for example, moves so rapidly that the human eye, even when aided by the best of microscopes, is unable to endure the strain of watching it for more than a few minutes at a time, and it is claimed that accurate pic-

# What's the Matter With Jim?

## The Story of a Boy Who Would Only Work When He Thought It Play

By JUDGE HENRY NEIL

ILLUSTRATED BY W. W. CLARKE

JIM wants to drive me in an automobile from Philadelphia to Los Angeles in forty hours. "Do it? Sure I can do it," he says. "We'll cross the plains at a hundred miles an hour; we'll go over the mountains at eighty."

Jim really means what he says. And he might do it, too. Jim is likely to wind up famous—or else as a convict for life. It all depends on the way society treats him. Jim has the physique of a boy of nineteen, but a spirit that has never grown up. He interests me intensely just because I have met thousands of boys like him. They are in jails or institutions for delinquents, and the only reason they are there is because they haven't found a harmless game to play, the way Jim has, with his speed mania and his rebuilt autos.

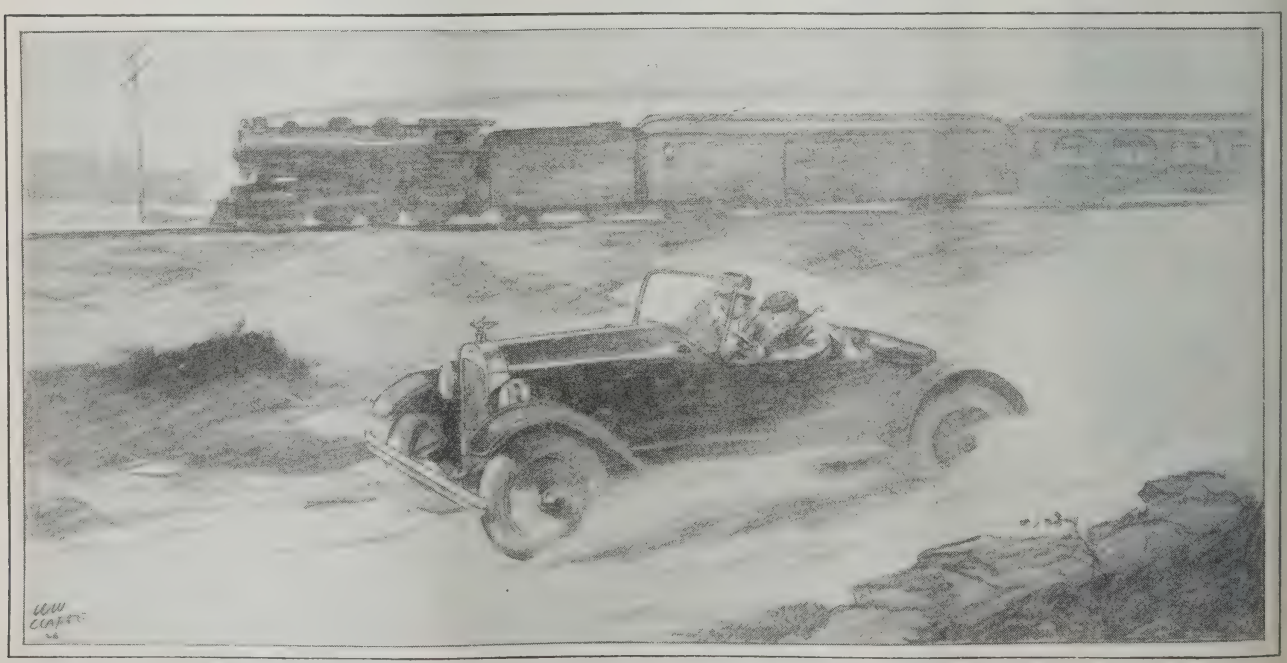
Nobody ever noticed anything out of the ordinary about Jim, as a small boy, except that his school-teachers said they could never make him take any study seriously. All boys like to play, but Jim never liked to do anything else. Finally the grammar school promoted him into the high school just to get rid of him. His eternal spirit of play had upset the decorum of the whole school.

Jim really learned something in high school. He did well in mathematics, because he found it was something like a game that he could play with himself. But after awhile mathematics began to bore him. He had discovered a more exciting game.

The first his parents knew of it was when they were called into a neighbor's to take a phone call from a Philadelphia hospital: "Your boy will live," they were told, "but his nose will never look the same again."

Jim's parents didn't even know he was in danger of dying. They thought he was in school. But he hadn't been going to school for weeks. He had been breaking the speed laws in "borrowed" cars. Here's what Jim confessed when they were allowed to see him in the hospital:

"I met Sam Slawson in the park this morning, and he said, 'Let's go to Jonesville to see the auto races.' He didn't have the carfare, though, and I didn't; so he said he'd borrow old man Heinie's delivery truck from back of the grocery store, and come back and pick me up in the park.



"He came along with the truck in a few minutes, and said he'd driven out through the alley, and nobody had seen him, and that we'd have the old bus back in its place again before anybody missed it. So we drove to Jonesville, and we had a bully time. Cripes! but those races were fine. One fellow ran away from all the others. The fellow in the third car couldn't see because of the dust, and he ran into the fence and a plank went straight through his body. His wife was in the grand stand and saw him killed."

Since I have come to know him, Jim has frequently told me that most automobile racers are killed sooner or later. Jim wants to be an automobile racer.

He isn't cold-blooded; but imagination was left out of his make-up and its place is filled by a vast boyish craving for excitement. He is a perfectly normal youth, but has carried over beyond adolescence the play-spirit of a boy of twelve years.

On the way back from the Jonesville races, Jim took the wheel and stepped on the gas. He was on fire with the excitement of what he had seen. But he emulated those racers too well. At a sharp turn in the road he went through the fence at forty miles an hour, and turned over in a ditch; and he came to in the hospital with the bridge of his nose smashed in. Twice since then a bit of bone from his shin has been grafted into his nose, but it doesn't look natural yet.

Jim's father paid the groceryman $200 for the smashed car, and put the boy to work with him in the factory. He developed a passion for machinery, and worked so hard the foreman said he'd wear himself out at that rate in a year. But it didn't last. One Sunday (Concluded on page 27)

Jim wants to be an automobile racer; he tries to beat all the trains if we are running parallel to the tracks.

# MR. FORD'S PAGE

WHEN we speak of studying history we usually mean studying books. History is being made all the time, is passing before men's eyes, and the opportunity to study its pre-library phase should not be lost. We do not get very far with history in the books unless we have a sense of it in present events.

It is instructive to observe the present phases of movements that march along together in this most interesting age. Inevitably we are participants, even partisans, in these movements, but that should not prevent us from that occasional detachment of mind which enables us to view these movements as outsiders.

Some people write and speak as if great movements were dependent solely on the pro-partisans and not at all on the con-partisans. Take, for example, prohibition. Many think that the movement for a dealcoholized humanity depends solely on the efforts of those who favor prohibition. This is surely a partial view. All life is movement, but that special movement which we particularly see, and on which we focus our interest, is like the column of dust-motes which a shaft of sunlight reveals. All the air of the room is like that, but the shaft of light illumines a strip that we may see. And there the dust-motes dance together, in unison and opposition, no one of them hindering the movement more than the other helps it, but all together parts of the movement.

*THE "wets" must be given large credit for making the country "dry." They furnished the excesses and stupidities which aroused public opinion to action. And they will yet complete what they have begun. All that is needed to enforce prohibition is for the "wets" to pursue their campaigns a little farther; goad public opinion to the level of imperial demand and invincible action, and the thing will be done. The "wet" has never received the credit due his great part in making booze an outlaw. However unfortunate Prohibition may have been in its friends, it has always been most fortunate in its enemies. Opposition puts good causes across.*

The "wets," so-called, are as much a part of the prohibition movement as the "drys," and it will be the "wets" that shall at last make the country "dry."

Is this a paradox? Not at all. Only the exaggerations and excesses of the "wets" can put across a "dry" campaign. If this had been a sober country, we should never have had prohibition. If the liquor business had been fortunate enough to have had brainy leadership, the question would probably have been settled in a different manner. But the liquor business did not have brains in its leadership, and has none now, which, together with an increase in "wet" gullibility, makes the finest kind of support for the "dry" program.

In the movement for a liquorless country you cannot minimize the immense aid given by the "wet" forces; they furnish the resistance which enables the movement to gather speed and power The country could not go "dry" without them. And it is becoming "drier" all the time becauseof them.

Here is history before our eyes, with one of its most obvious lessons, namely, that movements are composed of opposing forces, and that the negative force is not to be despised. Without it there is no victory.

See how the saloon created this great tide of prohibition sentiment in the first place. For 100 years, America asked the public house to be a good community neighbor. It refused. America asked it to exclude little children from the bar. It refused. The refusal goaded public sentiment into passing ordinances. The saloon refused to obey. This refusal caused the level of public sentiment to rise high enough for enforcement. Reform after reform was suggested, each refused by the saloon. Each refusal added height to the head of public sentiment, and year after year it rose higher and higher, lifted by the assininity of saloon leadership. Higher and higher, year by year, until at length it leaped the dam and swept away the whole business. Prohibition was born in the stupidity of the liquor leaders.

And that stupidity still favors the movement. Just now tremendous efforts are being made to lift prohibition to the status of the big issue in the next campaign. The "wets" are financing those efforts, just as the poor saloon-keeper of other days financed the very campaigns that sealed the doom of his business. The last liquor dollars are going now for a campaign whose only possible issue is to *make possible* the enforcement of prohibition. If, as they say, enforcement is impossible now, their further efforts against it are the only thing needed to make it possible.

This is the way history is made. *The opposition brings the thing to pass.*

To know history is to have no fear whatever of the fate of good causes. However unfortunate they may be in their friends, they are always most fortunate in their enemies.

It is a great historical movement we are witnessing, the spectacle of a nation acting after a century of deliberation to administer self-discipline, to enforce a self-imposed reform. All are caught up into that movement; all are assisting that movement whether they vote "for" or "against." No argument can deprive the "wets" of the lion's share in crystallizing the public opinion that has made and will keep the country out of partnership with booze.

# EDITORIALS

## *The President Sees and Speaks!*

IT WOULD now appear that the march of events is to accomplish what the voice of the American people would have done had it been permitted to be heard. The League of Nations and its subsidiary, the World Court, are steadily shedding their disguises and are being seen of all the world for just what they are—unworthy of the high names they have borne, mere agencies for the unregenerated political prejudices of Europe.

Events are proving the truth and sincerity of the arguments lately urged in this country against our participation in the World Court. Its proponents falsely preached that the Court was no part of the League. Now the League itself gives them the lie by assembling the members of the League to say whether the United States can enter the World Court under the terms we have made. If the League is honest it will not permit us to enter because our so-called "reservations" make the Court something less than a Court, and make us something less than a member.

However, the evil spirit of Europe is not dead. That which wrecked Europe is still active. In two months it destroyed Locarno, threw the League into its true place, and thoroughly exposed the humbug of the proposed disarmament conferences. The League and all its political appendages is now seen not to be the savior of Europe but its cat's-paw. Events have disclosed what argument expressed and wisdom foresaw.

There can be no partisan satisfaction in this, no satisfaction at all except that the broken reed on which the world was invited to rest its weight is now proved to be broken. It is not the idea of a League of Nations that we oppose, but the insufficiency of this *League* which is a sham and a delusion and a snare. It is not the idea of a World Court which we oppose, but the present World Court as the legal agent of the sham League of Nations. It is a great day for the World when shams are shown to be shams. It will throw the world back upon the realities, among which are sincere good will and a wise comprehension of the bases of peace.

No blame attaches to the statesmen of Europe. With the utmost good will they cannot make bricks without straw.

There is satisfaction, however, that our own Country was spared the deception. One nation high and dry is of more aid to the world than if it too were floundering in the upset of Europe's incorrigible passions. No thanks to anyone for this, but to the Providence that has signal purposes for this Republic.

It is of the greatest importance, as well as the highest gratification, that the Washington authorities, and the President especially, give evidence that they see things as they are. We quote here a Washington dispatch from the political correspondent of the Detroit *News* (March 18), which indicates our Government's attitude at present:

> American return to more active participation in international councils, presaged in the resolution of adhesion to the World Court and President Coolidge's tentative acceptance of a place in the proposed League of Nations disarmament conference, has been set very far in the future by the recent developments at Geneva in the opinion of our ablest European representatives.
>
> Alanson B. Houghton, ambassador to Great Britain, and Hugh S. Gibson, minister to Switzerland, who advised with the President and Frank B. Kellogg, Secretary of State, have painted the gloomiest sort of picture of the situation, as affecting international accord. They have said in effect that the nations of Europe have learned nothing from the World War and that the condition today is only less dangerous than in the years before 1914 in the respect that the powers are so impoverished as to make it difficult for them to carry on war.
>
> There is no present hope of a successful conference for reduction of armaments, either on land or sea, the President has been told, and the Locarno pacts, so hopefully hailed as the beginning of general European accord, actually are working to accentuate the division of the Continent into two antagonistic camps.
>
> The main points of the report of the ambassadors are substantially as follows:
>
> > The League of Nations no longer is a world league. It is a European council which is engaged in splitting into two camps . . .
> >
> > The European powers do not want to disarm and do not relish participation of the United States in their councils. Each side is merely using this country in an effort to pull its particular chestnuts out of the fire . . .
>
> The President has been told that the proposal of the disarmament conference in its beginning did not spring from any sincere desires of the European powers to disarm. Rather, Messrs. Houghton and Gibson have said, it was forced on them by considerations of the provisions of the Versailles Treaty in the course of the conference at Locarno.

In a second dispatch, the Detroit *News* (March 19) said further:

> The exceedingly pessimistic views of American Government officials with regard to the European situation constitute the most amazing turn in the tortuous course of American foreign policy that has occurred in many a day.
>
> It is not so much that President Calvin Coolidge and Secretary of State Frank B. Kellogg are discouraged with the outlook for settlement of the manifold disputes existing between the European powers, as that they have suddenly adopted a policy of frankly revealing this state

of mind. The statement as to the situation, while it was blanketed with the anonymity always applied to American governmental disclosures regarding foreign affairs, came from such a highly official source and it was so definite in tone as to startle all those who heard it . . .

On the side of future developments the whole statement pointed to an early withdrawal of American acceptance of the disarmament invitation as the first step in return to a policy of strict isolation from all matters political in Europe. The inference was unmistakable that from now on we will keep hands off in all respects, at least until there is a distinct change of heart on the part of the European nations . . .

There is reason to believe that the real design of the American Government in its outgiving was to indicate to Great Britain that she must get out of the internal intanglements of European politics if she is to expect further American support in adjustment of the economic difficulties of the continent . . .

## *If It's Pagan, It's Harmless*

WHEN GitcheManito, the Good Mystery, created the earth it was bare, without trees or shrubs. Then he created two Indians, a man and a woman. This, in Indian Mythology, represents the Creation. Long ago a great storm came. The Indians baked a great earthen pot and in this pot two of them saved themselves. Also two rattlesnakes were saved in a like manner. When the waters sank a dove was sent to find land. It came back with a grain of sand which immediately stretched becoming dry land. This is the Indian version of the Flood. Thunder has a nest where a very small bird sits upon her eggs during fair weather. When an egg hatches, the skies are rent with bolts of thunder. Such is Indian mythology which is to be taught to the young people of the Cheyenne high school by Chief Brave Hawk, a full-blooded Sioux chieftain from the Rosebud reservation in South Dakota. Fifty years ago Sheridan sent Custer to the Little Big Horn to teach the Indians the power of the Great White Father. Today the grandnephew of Chief Rain-in-The-Face teaches the descendants of the white soldiers the beauties of Indian lore as told to the dusky boys and girls who knelt at the knees of some old Nokomis hundreds of years ago.

And it is all permissible. No one objects. Why should they? For this is not the forbidden Biblical cosmology, it is only a pagan cosmology, and therefore wholly unobjectionable.

## *How the U. S. Can Boost the Air-Mail*

THE air-mail is in a peculiar position so far as public use goes. When railroads came in the Government did not advertise "Send Your Letters by Rail," thus leaving the people a choice between the stagecoaches and the locomotive; the Government simply lifted the mail onto the steam cars and that was the end of that. The Government made the change. Now, however, the airplane has come in and the Government is satisfied with advertising "Use the Air Mail," giving the citizen his choice between mail train and airplane. Why not make the air-mail an integral part of United States Postal Service by lifting all long-jump mail off the trains and sending it by plane, not at the choice of the sender, but as part of improved Government service. There will still be local mail enough for the trains to carry.

On some of the mail routes only a few ounces of mail are carried every day. The reason for this is that it is left to the sender to decide, and the public impression is that a lot of red tape surrounds the sending of a letter by air-mail. Air-mail could cease being a selective *de luxe* service with a great deal of benefit to itself. It could carry tons where it now carries ounces if the Government itself would use the air routes for the regular transportation of mail where air routes are established.

Air-mail does not promise to become much of a factor in American business until the Government hooks it up with the regular mail service. At present it is largely a matter of romantic interest. We write about air-mail as the melodramatists used to write about "The Night Mail." And most people have in it only a postage stamp interest. The air-mail will grow as it becomes less of a *de luxe* service depending on the selective interest of the public and becomes more the Government's usual method of forwarding our letters.

## *Pensions for Criminals*

FORTY-FIVE years ago, on March 13, Alexander II, Emperor of All the Russians, was assassinated. Nine of the assassins are still alive—although the ferocity of monarchical Russia has been represented as of so vicious a degree that such a fact would be considered impossible. Nevertheless, according to the Soviet officials, nine of the assassins are still living—eight women and one man. To commemorate the event, to encourage the cult of assassination, the enlightened Soviet government has pensioned each of the surviving participants with $112 a month, an enormous sum in Russia these days, equal to the highest salaries in the government. This is not at all out of the ordinary. In the sand dunes of Michigan, when the United States Government swooped down upon a most secret conclave of the Soviet secret propaganda in America, a list was found of a number of Americans marked for assassination. The reward of past crimes furnishes a very clear proof of the policy which would be followed in the event of future crimes.

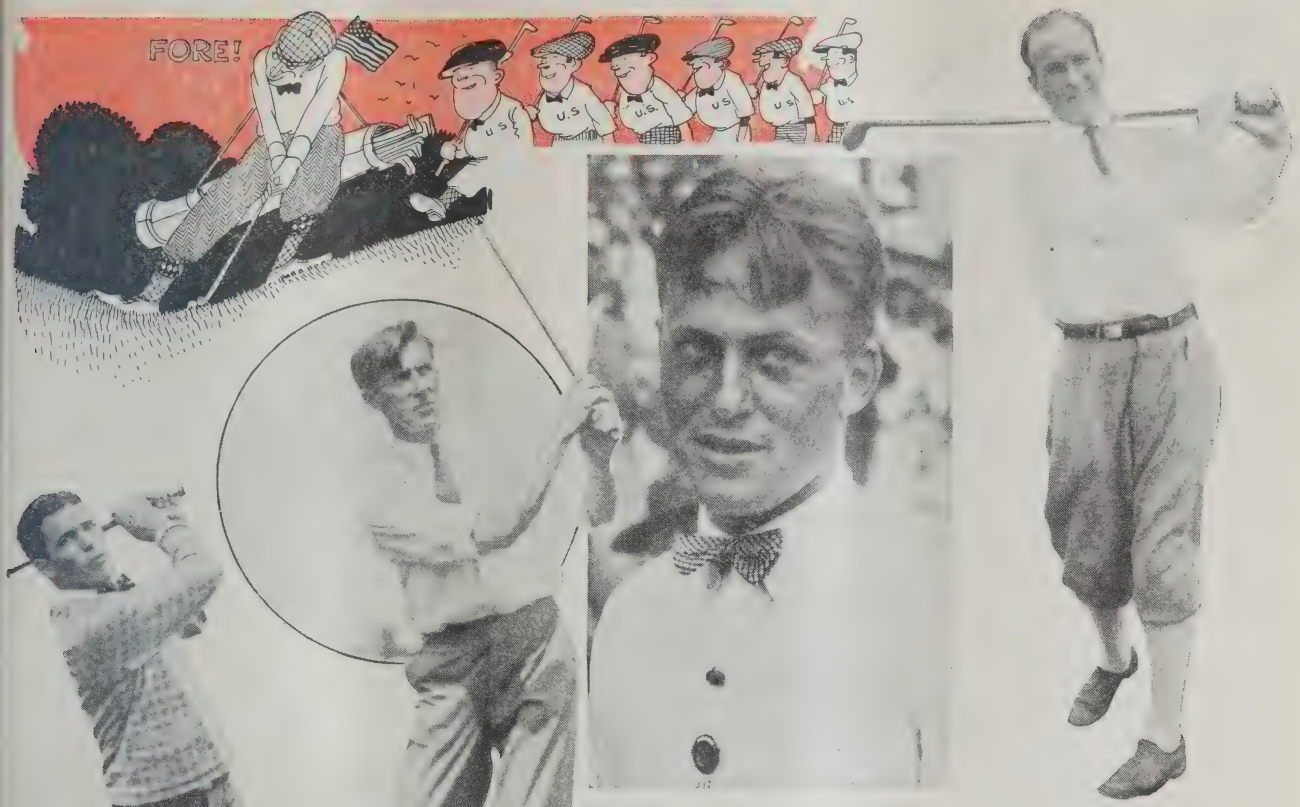
## Americans Will Attempt to Capture Leading British Honors

By PAUL MacDONALD

DRAWINGS BY W. O. FITZGERALD



THIS spring America is launching the strongest offense against Great Britain that she has yet produced. Before the United States again celebrates the anniversary of her independence on July 4, her home-bred golfers will have attempted to capture the leading four golfing honors that will be competed for in the British Isles this year, namely, the British amateur championship, the British open championship, the Walker Cup and the British women's championship.

In her attempt to take from Great Britain the choicest of her golf prizes, the United States has marshaled together the finest array of golfing talent procurable on this side of the Atlantic. She is sending eight amateurs to Great Britain to lift the British amateur championship and again win the Walker Cup, emblematic of international supremacy at golf. She is sending the pick of her professionals to retain the British open title and the best of American women golfers will make her second attempt this year to lift the women's championship.

If the United States fails to win at least two of the four championships it will not be the result of careless selection and lack of preparation. The group of amateurs that will try first for the British amateur crown and then for the Walker Cup is headed by the brilliant Bobby Jones, probably the best golfer in the world, amateur or professional. Supporting him will be Robert Gardner, Francis Ouimet, Jesse Sweetser, Jesse Guilford, Watts Gunn, George Von Elm and Roland Mackenzie. Nearly all of them have helped make amateur golf history for their native land and it is doubtful if at any time a group of amateurs as talented as this octet has been assembled.

In the British open tournament will be found the best professional golfer the United States has produced, Walter C. Hagen. His reputation is as powerful on the other side as it is in America, for in three years he twice won the British open title and in the other year he was runner-up, missing the championship by a single stroke. Hagen won at Sandwich in 1922, finished second to Arthur G. Havers at Troon in 1923 and landed first again at Hoylake in 1924. He did not compete last year. "Long Jim" Barnes, present holder of the British open crown, and Macdonald Smith, will also go from these shores and try for Great Britain's open honors.

Smith might have won last year but for the crowds that swarmed the fairways, jostling him and so interfering with his play that the handicap beat him, an occurrence that has since caused British golfing authorities to decide upon an admission price for her big tournaments in the future.

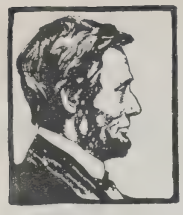
Left to right—Watts Gunn, "Long Jim" Barnes, Bobby Jones and Robert Gardner.

There was no admission in the past and the countryside declared a holiday, people swarming over the links and making play at times impossible.

Miss Glenna Collett will try for the second time to lift the British women's crown, and since Miss Joyce Wethered has announced that she does not intend to compete, the chances of the American girl are excellent. With Miss Wethered engaging in the tournament Miss Collett would be up against a better golfer. Miss Wethered was undoubtedly the best of her sex, but Miss Collett may be ranked second. She failed to win the British title last year, but went to France and captured the French championship. Later in the year she won the United States Women's National. She averaged 78 in her major tournaments in 1925 and turned in a card of 71 in her match with Cyril Tolley, the crack English amateur. The 71 defeated Tolley and stands as one of the finest performances ever delivered by a woman golfer.

The British press seems considerably excited over the American invasion this year. English writers point out that America is confident not only of winning one of Great Britain's golf crowns but expects to make a clean sweep, and that her golfers will return to the United States possessing the Walker Cup, British amateur, British open and British women's titles. And the British press incidentally takes a pessimistic view on England's chances of preventing America from winning two or three of these honors, if not all.

There has naturally been much criticism, and this is directed at the men in control of organized golf in Great Britain. Why, asks the British press, have not steps been taken to defend against this invasion?



While the United States has, with its usual careful planning and foresight in such matters, been engaged on details of organization and arrangement, the golfing officials on the other side have done nothing. They have always gone about international competition in sports in a haphazard way. As an instance: England does not name her Walker Cup team until after the British amateur is played, and then the golf authorities select the eight men that did the best work in the tournament. This places a severe handicap upon the men selected. The Walker Cup is decided by team play and it is impossible for men, matched a day or so before team play starts, to do their best. The pairings are generally a strange mixture of golfing temperaments and the men paired more often than not show strangely dissimilar styles. Cyril Tolley, one of England's crack amateurs, has had four different partners in four Walker Cup matches, and in only one of them did he and his partner win. On this occasion, in 1923, he was paired with the brilliant Roger Wethered at St. Andrews.

The United States gives particular care to her pairings. In each bracket are found men suitable to one another's style. They train hard and systematically, observe diet, regular hours and, in brief, live up to the same training program that is followed by college athletes during their season of activity. They use every possible safeguard to prevent defeat.

England has never done this. England has taken a stand something like this:

"It is all right for Americans to do that sort of thing but not for us British. We do not make a business of golf; it is a sport with us; therefore there is no need of going into training and intensive practice. If we lose we shall lose gracefully."

But this attitude is not to the liking of all Britishers. They ruled for many years in golf and in polo. Their supremacy in golf exists no longer while in polo they have fallen completely before the American assault. *(Concluded on page 32)*

# Lincoln's Murder—Amazing Man Hunt

## John Surratt, Papal Zouave, Accused of the Crime, Who Leaped for Liberty Over a Hundred-Foot Precipice

By F. L. BLACK

"WHOSO sheddeth man's blood, by man shall his blood be shed," ominously quoted the judge in his charge to the jury in the case of John Harrison Surratt, accused of the murder of Abraham Lincoln. Surratt had escaped to Canada and been concealed for five months by friendly priests; he then fled to Liverpool, London, Paris, Rome; was discovered in the Papal Zouaves and arrested by order of the Pope; he later escaped to Egypt; was arrested again, to be brought in chains on a gunboat to Washington; tried for his life, released, and then deserted by the Genius of Adventure.

This sounds like the synopsis of the strangest fiction, but it is what actually happened to Surratt, Confederate dispatch-bearer and spy, who was a party to the Lincoln abduction plots, and whose mother, Mary Surratt, paid the extreme penalty for her participation in these crimes.

The assassination of President Lincoln occurred sixty-one years ago this week. Testimony was offered at the trial of the conspirators in May, June, and July, 1865, to show that John Surratt had been in Washington on the morning of Friday, April 14, the fatal day, but in his lengthy and highly sensational trial, two years later, he established that he had been in Elmira, New York, arranging for a prison delivery of Confederate captives when John Wilkes Booth played his last tragic act in Ford's Theatre, Washington.

"At the breaking out of the war," said Surratt in telling his story to a Rockville, Maryland, audience in 1868, *"I was a student at St. Charles College, in Maryland, but did not remain long there after that important event. I left in July, 1861, and, returning home, commenced to take an active part in the stirring events of that period. I was not more than eighteen years of age, and mostly engaged in sending information regarding the movements of the United States Army stationed in Washington and elsewhere, and carrying dispatches to the Confederate boats on the Potomac. We ran a regularly established line from Washington to the Potomac, and I being the only unmarried man on the route had most of the hard riding to do."

John Surratt in his Zouave uniform.

He then told of his meetings with John Wilkes Booth and the latter's proposition to kidnap President Lincoln and take him to Richmond. Surratt claims that although at first "amazed, thunderstruck, and in fact, I might say, frightened at the unparalleled audacity of the scheme," yet after two days' reflection, he concluded it to be practicable and "led on by a sincere desire to assist the South in gaining her independence," he told Booth that he was willing to try it. Then followed months of plotting to capture the President, plotting which failed.

In Surratt's own words: "One day we received information that the President would visit the Seventh Street Hospital for the purpose of being present at an entertainment to be given for the benefit of the wounded soldiers. The report reached us only about three-quarters of an hour before the appointed time, but so perfect was our communication that we were instantly in our saddles on the way to the hospital. This was between one and two o'clock in the afternoon. It was our intention to seize the carriage, which was drawn by a splendid pair of horses, and to have one of our men mount the box and drive direct for Southern Maryland via Benning's bridge. We felt confident that all the cavalry in the city could never overhaul us. We were all mounted on swift horses besides having a thorough knowledge of the country, it being determined to abandon the carriage after passing the city limits. Upon the suddenness of the blow and the celerity of our movements we depended for success. By the time the alarm could have been given and horses saddled, we would have been on our way through Southern Maryland

*(Printed in the Washington *Evening Star*, December 8, 1870. Reprinted April 12, 1908.)

toward the Potomac River.

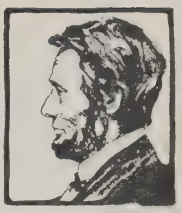
"To our great disappointment, however, the President was not there, but one of the Government officials—Mr. Chase, if I mistake not . . . It was our last attempt."

Surratt stated further that the enterprise was then abandoned, and that soon afterward he was given Confederate dispatches to carry from Washington to Richmond, where he arrived on "Friday evening before the evacuation of that city." He left the next morning and again reached Washington "the following Monday," at four o'clock p.m., April 3, 1865. He claims that he left for New York the next day without having seen Booth, and that this was his last time in Washington "until brought there by the United States Government a captive in chains."

He attempted to see Booth in New York but was informed that the actor was in Boston. Surratt then proceeded to Montreal, and after remaining a week was instructed to proceed to Elmira, New York, to make sketches of the military prison and gather information that would aid in the release of the Confederates confined there. Surratt testified that he registered as "John Harrison" in Elmira on the Wednesday before the assassination, palmed himself off as a Canadian in an "Oxford cut jacket and a round-top hat, peculiar to Canada at that time," and remained there until Saturday, when he learned of the assassination and that it was rumored John Wilkes Booth was the assassin.

On the following Monday, after spending the week-end in Canandaigua, a village near Elmira, with the intention of going back to Baltimore, he bought some New York papers and was startled with: "The assassin of Secretary Seward is said to be John H. Surratt, a notorious secessionist of Southern Maryland. His name, with that of J. Wilkes Booth, will forever lead the infamous roll of assassins."

Montreal, not Baltimore, suddenly became his destination. Arriving in Montreal, which had become the home



Mrs. Mary Surratt, the only woman the United States Government ever hanged.

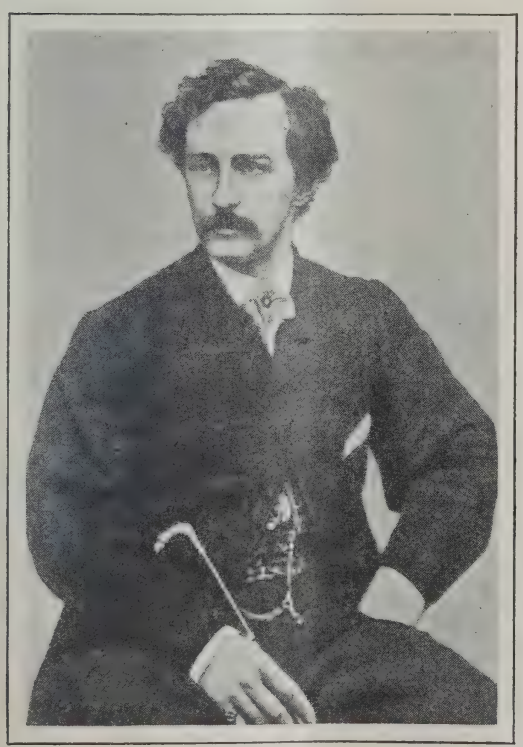
of many Southerners, Surratt was secreted in the house of a friend where he remained until advised that his hiding place was suspected and the house was to be searched. He left immediately, but after the authorities had satisfied themselves that he was not there, he returned and remained until he left Montreal about a week later. Then as Charles Armstrong and disguised as a huntsman he hid in the home of Father Charles Bouchers, a priest in St. Liboire, a small town lying about 45 miles south of Montreal in a thinly settled territory.

During these days he naturally became greatly worried about the possible fate of his mother, who had been arrested and was being tried as one of the assassination conspirators. He was assured by friends, however, that there was no cause for uneasiness and that any action on his part would only make matters worse.

These friends, he says, became frightened at the prospect of breaking the news of his mother's death sentence, and it was only by accident that, several hours after the death trap had been sprung, he procured a paper containing the news of her execution.

Surratt told his Rockville audience that after partly recovering from the effect of the shock he went to his room and remained there until dark; then signified his intention to leave the place immediately. "I felt reckless," he said, "as to what should become of me. After visiting Quebec and other places, with the reward of $25,000 hanging over my head, I did not think it safe to remain there, and so I concluded to seek an asylum in foreign lands."

Father LaPierre (Surratt Trial Records—p. 908), a priest of Montreal, cared for Surratt from late in July until early in September, and then accompanied him to Quebec, where, disguised and under the pseudonym of McCarty, he placed him on board the *Peruvian*, bound for Liverpool. Convinced that there was an American detective on board, and bewildered by his own imagination, Surratt confessed to Dr. McMillan, the ship's physician, his true identity in an effort to obtain protection and advice.



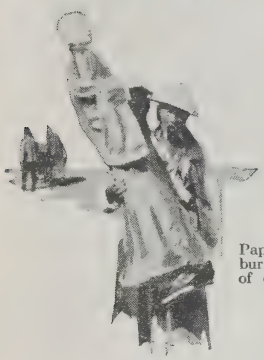
Either feeling it was his duty or with a desire to collect the reward still offered for Surratt, the doctor, on September 26, informed the United States Consulate at Liverpool of the presence of the fugitive. The vice-consul conveyed this intelligence to Washington, but to his surprise, on October 13, received the following from the Acting Secretary of State:

"I have to inform you that, upon a consultation with the Secretary of War and Judge Advocate General, it is thought advisable that no action be taken in regard to the arrest of the supposed John Surratt at present."

The only explanation that has ever been given for this action, and the subsequent delays in apprehending Surratt, is that official Washington began to doubt whether the execution of Mrs. Surratt had been advisable and was not anxious to reawaken the storm that resulted from what many termed her "official murder."

After waiting until early in November for funds expected from Canadian friends, Surratt made his way to London and then to Rome by way of Paris, where after a few months, under the name of John Watson, he enlisted in the Papal Zouaves. This was during the war between Pope Pious IX and Garibaldi, and recruits were welcome in either camp.

By a strange coincidence, Henri St. Marie, a Canadian who had known Surratt three years before in Washington, had also become a Zouave and recognized him. Surratt appealed to St. Marie to keep his secret, but the latter succumbed to the temptation of the large reward. He (Continued on page 30)



John Wilkes Booth.

# What It Costs the Chines

## Cathay Expends Tremendous Sum in Doing Reverence to Its Departed

By INEZ MARKS LOWDERMILK

Paper wife to be burned in honor of departed husband.

CHINA is a land of ancestors. The silent population greatly outnumbers the teeming, struggling millions of both city and countryside. The land of China must support a double population and supply food for the living as well as space for the innumerable host of ancestors who have gone before. Yet the living are now estimated at four hundred and thirty-six million.

The most conservative medical statistics say that seven out of ten children born in China die before the age of five. The present population represents only about three-tenths of those born. Thus during the life span, which, in China, the available statistics say is about twenty years, the born population of China approximates one and a half billion persons and is almost equivalent to the entire living population of the world.

An attempt to count the graves in China today would be more difficult than to count the stars in the Milky Way. In past history, all graves were razed to the ground at the beginning of each dynasty. However, the Manchu dynasty did not destroy the Ming tombs, and when the monarchy turned into a republic, the Chinese were too democratic to do this to their ancestors, and so the graves have not been razed for about seven hundred years. The life span in China is short. Religion and custom demand a proper burial. Imagine, if possible, the grave-strewn appearance of every landscape where graves are protected and worshiped and never intentionally destroyed. The landscape often seems to grow nothing else.

This overcrowding by the dead is largely the result of the ancestor worship taught by China's ancient sages. Three things are unfilial and having no sons is the worst, says Mencius. Confucius requires a man to cleave to his father and mother and compels his wife to do the same. He taught that the happiness of the soul in the next world was dependent upon having sons in continuous line to worship the departed spirit. This man-made idea has made China go sonmad.

Ancestor worship with its obsession for sons and more sons is responsible for a long train of ills in China today. It compels the adoption of sons in a family already overflowing with daughters, even though there is no provision for their support. It is the cause of polygamy and concubinage, with its resulting heartaches and tragedies. It leads to early dependent marriages, and this brings into existence millions of human beings, who, by reason of the excessive poverty, can scarcely keep soul and body togeth

It causes infanticide among the po Daughters are too much of a luxury to brought up when the mouths to feed already too many. Three surveys, each one thousand rural homes, showed th there were almost a third more bo than girls. Every city has its home unwanted babies, in which there seldom, if ever, a boy.

Ancestor worship, when interpret in its results, is one of the heavi yokes which ever a people was co pelled to bear. The generation of tod is chained to the generation of the pa Ancestor worship makes dead men in gods who require more space a reverence than that accorded to t living. This backward look for ce turies produced the leaden conservatis from whose shackles the n China is now trying to extrica itself. China may cast away idols, but ancestor worship tenacious persists among all classes.

Overpopulation in most countries sults in new conquests and colonizatio People in China are dependent for fo supply from the surrounding soil becau transportation is slow and primitiv They never leave their homes except du ing severe famines. Thus the increa

# to Worship Their Ancestors

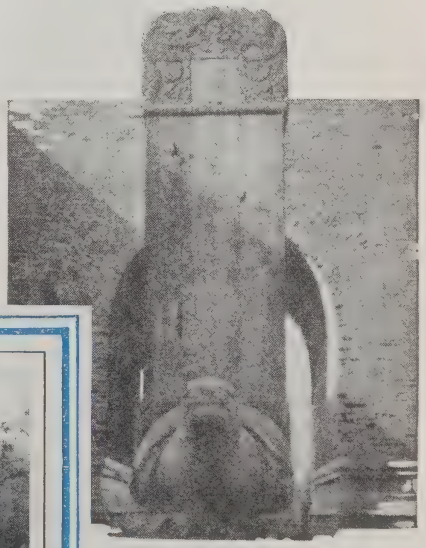
re—Nearly all Chinese funeral processions have bands playing on native instruments. Only the rich can afford s which play foreign instruments and tunes. Left—Giant men and animals take part in funeral processions to frighten evil spirits.

ing population attempts to live on the former food supply and a frightful condition of poverty results, especially in North China.

China needs more land in and around her densely populated centers. If she *ld*, she could increase her acreage re from ten to thirty per cent by level- all graves to the ground, and thus vide space and food for the living. A n is honored after death by the size of grave and the space allotted him with- he surrounding earth wall. Sometimes n a hundred square feet to an acre is s reserved for the grave of some in- ential ancestor.

While the living are deprived of this d for producing food supply, grave ds do have some economic value. rly the grass is literally shaved off grave lands and carried into nearby ns to be used for fuel. Even the roots dug up. And all this in a land under- l with some of the richest coal deposits he world, lack of transportation making products of nearby regions unavail- e. But need for food from the soil is great essential. If the number of are miles devoted to graves in China ld be computed, it would, without bt, bring into service many millions cres of tillable lands, and always in the st densely populated regions where the ggle for bare existence is the keenest. The worship of the dead is a tremen- s financial burden to the people of na. For nothing else does custom de- nd such a lavish expenditure of money, regardless of one's financial condition. People of all nations desire a decent burial for their dead, but ancestor worship requires that the Chinese spend a far greater sum in proportion to income than that expended by other races. Elaborate display and ceremony assure the departed spirit of an easy time in Hades and a speedy rebirth into a high estate on earth.

Considerable information has been obtained on the cost of funerals. The money and display are in accordance with one's age and status in the family. It is thought inconsiderate and unfilial for a child to die, and up to the age of fifteen no rites are observed at its burial.



The very rich will spend $100,000 or more on a funeral. The rich spend from $1,000 up, according to their available resources. The middle class spend approximately an entire year's income, which, of course, is the savings of many years.

Imperious custom demands that the poor, in spite of their poverty, have funerals far beyond their means. As a result, the poor man very frequently has to mortgage all his possessions, borrow money, and saddle himself with a lifetime debt, for this one display.

Borrowing money is one of the curses of China. The average rate on absolutely safe property is 24 to 36 per cent yearly. On unsecured short loans the poor man has to pay from 50 to even 100 per cent interest.

Fifty to eighty dollars, Mexican, is the amount usually spent by poor families on the funeral of a head of a household. The appalling amount of this sum is not realized until one considers that the average income may be only $80 to $250 a year, and that every cent is needed for bare essentials. There is seldom an opportunity for the accumulation of savings. Funerals act like famines in sweeping away all savings and usually plunging the family into debt.

Since custom requires that even the poor bury a parent on a scale which the family resources do not warrant, most rural towns have coöperative burying associations. These are composed of a given number of families. Upon the death of the head of a household, each family gives a stated sum of eighty cents or a dollar, Chinese money. This assessment supplies some ready cash that can be paid back in small amounts as other deaths occur. The custom which requires that

Above, right—Turtle, significant of longevity. Lower—Approach to the Ming tombs at Nanking. One who can throw a stone which remains on top of an elephant will have a son within a year, it is said.

huge wooden caskets be provided for parents was instituted centuries ago when extensive portions of China were covered with forests. It is now one of the heavy economic burdens of ancestor worship. Chinese caskets are made of thick pieces of the best woods, varying in weight from eighty to a thousand pounds. *Lan mu* is considered the best because of its lasting qualities.

Some years ago, *Lan mu* slabs of a casket, buried for two thousand years, were unearthed at the University of Nanking. They were in such good condition that furniture has been made of them. A man's financial status usually can be rated by the size and thickness of his casket. Coffins cost from $15 to $8,000. The former are thin, knotty boards. The expensive ones are made of rare woods.

If a son wishes to please and comfort his father, he will present him with a large and expensive casket while his father is still in good health. It is stored in the home or nearby temple until needed. This gift proves that he is a faithful son and will attend to all the proper rites and ceremonies when the father departs. Although China

***Making Precious Trees Into Burial Caskets***

is almost treeless in many regions as a result of man's destructiveness, this extravagance of wood in caskets persists, even though the people live in mud houses with only the barest necessities. It is no doubt true that more of China's precious remaining trees are made into caskets than are used in making homes and furniture and comforts for the living.

China now yearly imports millions of dollars' worth of Oregon pine from the United States for her present industrial needs, and she is taking no steps to provide lumber to meet the great industrial development which is sure to come to China in the next few years.

In China, the lack of expense connected with birth is more than made up for in the expense and rites connec ed with death. Everything is prescribed by custom. The corpse must wear clothes of certain materials. These must be of an uneven number. Usually five, seven, nine or eleven gowns. Should the corpse accidentally wear an even number of garments, another death in the family would speedily result. The garments must not have buttons, for these would weigh down the soul in its upward flight. Fur garments must not be worn, for this would cause the soul to be reborn into the animal whose skin was in the casket.

At death, each soul separates into three souls. One soul remains with the body, one goes to Hades and the third enters the ancestral tablet and is worshiped daily. The tablet is made of wood and occupies the central place on a table next to the inner wall of the guest room.

When death is imminent, firecrackers are set off to clear the air of evil spirits in order that the soul may have an unmolested journey to the next world.

***The Geomancer's Strange and Weird Work***

In China, one cannot be buried except on days that have been decreed by the almanac as propitious for burial. Should an unlucky day be chosen, the corpse would be uncomfortable and ill at ease in its resting place, and take revenge upon the family by causing some calamity. A professor of magic or a geomancer is, therefore, invited to set the day and site for burial. On no account must one be buried in the same spot where years previously another had been buried. This would result in a disastrous mixing of souls. The geomancer is able to detect this by means of forked sticks. In choosing sites, he has no regard for the economic values of land. The result is that graves are located promiscuously, and often on the most fertile and productive parts of the farmer's fields.

This geomancer has a very remunerative position and muc'i influence. The owners of land must be generous or their lands will be condemned. The purchaser must be generous or an unlucky site will be chosen and disaster befall the living. All graves, except those of the poor which are huddled together, must be located satisfactory to the *feng swei* or "wind water" good luck of the grave. This produces the most difficult problem of the foreigner buying land in China. One family owns the land, while the graves are owned by an equal number of families. These graves are not included in the deed and are only with great difficulty and patience removed.

Last year our neighbor had the basement excavated and foundations in for a new home. The geomancer decreed that the obstacle of a foreign house would destroy the *feng swei* of an important ancestor nearby. The Chinese were obdurate, and there was nothing the American could do except dig up the foundations and build his house on a different place. Our success was a trifle better. The scaffolding had been put up for the first story when the relatives of several ancestors in our yard came to life. They tore down the scaffolding, and for seven months, all operations ceased while middlemen discussed pro and con. Ultimately permission was given to proceed with the building.

The reluctance of the Chinese to move graves is better understood when one knows that there are two courts in hell reserved for those who dig up or remove graves except under certain conditions. However, the Chinese are finding that some of their ancestors bear removal if sufficient money is offered.

***Living in Hades With the Comforts of Home***

The Chinese do not seem to know whether the path of the soul lies by way of the Buddhist or Taoist religion, and if funds permit, both are called in to chant prayers for the dead and secure his speedy release from Hades.

A funeral in China is not a solemn occasion as for the westerner; instead, it is a period of lively celebration. The chanting of priests, the pounding of drums and gongs continues from early morning until far into the night. The relatives and friends of the deceased take up a partial abode in the home. Several feasts are given.

The courtyard is hung with rented embroideries of bright red. The rooms of the house are covered with scrolls sent by friends, which enumerate the merits of the deceased. In an important funeral, there may be several hundred of these, representing a large expenditure of money. The celebrations usually last seven days, and if funds permit, every seventh day following until the forty-ninth day, when the casket is buried.

The Chinese arrange for the departed one to live in Hades with all the comforts of home. All art cles burned are supposed to enter the spirit world and so the family prepares quantities of imitation money, houses, servants, paper clothes, rickshaw, jewels and other things. Recently paper automobiles and a driver have been added to the list. Since modern invention has introduced safes with combination locks, these also have been imitated in paper and thus sent to the dead, so that they may keep

***Burning His Paper Spirit Wife***

their valuables in safety. Sometimes a paper wife or concubine will be burned at the grave so that the man will not be lonesome, but I never heard of burning a paper husband at the grave of a wife.

The catafalque is a large rectangular frame, covered with red embroidery and placed over the casket. An even number of coolies, usually from eight to thirty-two, carry the coffin. The procession starts with a volley of firecrackers to ward off the evil spirits. Also quantities of paper punched with holes is thrown into the air from time to time. Evil spirits must pass through every hole they encounter, and this process delays them until the corpse can reach the grave in safety. There is always a Chinese band and if means permit, another one which plays foreign music. Their favorite tunes in our city are "Yankee Doodle," "Over There," "When Johnny Comes Marching Home," and "Massa's in the Cold, Cold Ground."

Every funeral procession contains numerous banners and embroidered parasols, and giant men and animals to scare off the evil influences. Beggars rejoice in a funeral, for they are employed, sometimes by the dozen, to carry the various articles in the parade. The procession may be more than a mile in length.

The nearest male relatives of the deceased walk just ahead and carry streamers attached to the casket. They are dressed in white sackcloth, and are bent over in abject sorrow as they walk. Following

***Must Worship Dead for Sixty Years***

the casket are the women relatives. Numerous rites are performed at the grave amid the noise of firecrackers and the calls of the coolies as they lower the heavy coffin into its shallow receptacle. The deceased at last is laid to rest, even though it may have been months since his death. But the family must continue their worship of the departed one at the grave every autumn and spring festival for a minimum of sixty years, and by offering food and incense in the home before his tablet.

Every funeral produces a new ancestor. His going depletes the family savings and very likely plunges them into debt. His thick heavy coffin has used up a portion of China's much-needed timber. Quantities of paper have been burned or thrown into the air. His final resting place, unless he belongs to the very poor, will be much larger than that accorded graves in other lands. It will withdraw another plot of ground from the production of food, and China is worse off, in spite of her overpopulation, than if he had never died.

## Napoleon as a Cook

MARIE LOUISE, the second wife of Napoleon I, used to enjoy relating how her husband discovered her in the act of preparing an omelet secretly in her apartment.

"Bah! You don't know how to do it at all!" he exclaimed, taking up the utensils. When the moment came to toss the omelet, Napoleon wanted to do it himself. He tried to perform this important operation, but had no more success than the great Condé, who pitched his omelet into the fire. Napoleon's fell to the ground and he was then obliged to confess his want of experience, and let the Empress continue her cooking alone.

# Is America a Nation of Coffee-Bibbers?

## Its People Drink Upward of Forty Billions of Cups of This Seductive Beverage Each Year, Consuming More Than Half of World's Production

By DIRK P. DE YOUNG

(C) E. M. Newman.
Coffee pickers at Santos, Brazil.

Cup-testing coffee.

TWELVE and one-half pounds of coffee, three hundred and seventy-five cups of the aromatic liquid for each subject of Uncle Sam a year—more than forty billion cups of the refreshing drink—consuming more than half of the world's supply of the little green bean, is the coffee-bibbing record of this United States of America.

Most of the coffee consumed here comes from Brazil, which produces more than half of the world's crop. Stationed at Santos, the great Brazilian coffee port, as a consular official, some time ago, I got a whiff of this tremendous coffee business, as well as of the berry itself in its native state.

Santos is only a small city, but it handles many million bags of coffee, exported from there to all the ports of the seven seas. The great coffee warehouses there extend along the entire water front of a well-dredged river which accommodates ocean-going steamers of any depth, while the docking and loading facilities of the port are unexcelled.

Every steamer which stops there, and thousands do, takes on a cargo of coffee for somewhere. Santos is all coffee, coffee, coffee. Wherever you look, whithersoever you go, you hear about coffee, see coffee, and smell coffee, nothing but coffee. Furthermore, as you approach the city from the ocean, winding your way slowly up the little river by steamer, the aroma of the green beans greets you. Indeed, there is only one thing in Santos which overshadows coffee—mosquitoes. They have a breed there which is a little larger than the coffee bean itself, with a stinger like a bumblebee—a species of the bug far superior in all points of nuisance value to the famous New Jersey breed. It is furthermore no exaggeration to state that for every bean of coffee in the port there are at least two mosquitoes, while compared to the rest of the world in the production of such insects Santos no doubt holds a record there, too, producing more than half of the world's supply of anopheles. But those pests are in Santos, the seaport of the great coffee-producing region of Brazil, not in the fine area where the plant itself is cultivated.

Coffee comes to Santos by rail from São Paulo, the capital city of a Brazilian state of that name, a very wealthy city, and the real headquarters of the world's coffee industry. The port of Santos, a few hours' ride below, is connected to the metropolis on the mountain tops above by a cable railway, one of the great engineering feats of the world. The route winds upward along the edge of deep ravines, while the track is worked with terraces all along it. Rock-carved ditches, with clear streams of water trickling down from the wooded mountain tops higher up flowing through them, form only a part of the beautiful landscape along the roadbed.

In São Paulo, the commercial center of Brazil, the hustle of New York and the fashions of Paris meet. It consists of an old and a new town, the new embracing the latest and most up-to-date of modern civilization, while the old is typical of Spanish America. The opera house there—the Municipal Theater—which eclipses anything of its kind either in North or South America, is a work of architectural art. The New York Metropolitan Opera is not even second class as compared to the one in Buenos Aires, while this one at São Paulo—where the coffee barons of the world live—with its fountain and geometrical parkway, built on the edge of a high slope overlooking the city, far excels the one in the gay capital of Argentina.

The coffee tree grows in that region which lies gradually south of the city of São Paulo, where the soil and climate of that section is peculiarly adapted to the staple. Indeed, it thrives so well there, that preventive measures are taken from time to time to stop overproduction. The coffee tree is not native to Brazil, having been brought from Arabia, where the coffee habit originated.

Although authentic records go back only about five hundred years, it is thought that coffee-drinking is of a much older period. It is not reported that coffee beans were found in the tomb of King Tut, but we read of public places for coffee-drinking and amusement in Egypt, Syria, and Turkey, long ages ago. Coffee-drinking was popular in Venice as early as 1616, and was highly popular in Paris during the reign of Louis the XIV, spreading to Berlin and Vienna in the seventeenth century, and to Holland, where for many generations the Dutch housewife never allowed the coffee pot to get cold.

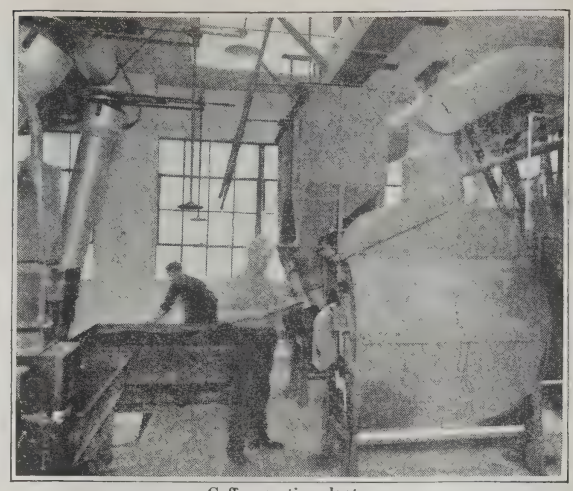
For a long time the world's supply of coffee came from Abyssinia and Arabia, but the demand for the delicious cup caused the cultivation of the berry to spread to other parts of the world, and finally to Brazil, where three-quarters of the earth's production now takes place.

For a long time Germany and Holland held the world's consumption record, but now those people cannot hold a candle to the coffee-bibbing proclivities of Uncle Sam, where more than a billion pounds are required for our annual brew, used regularly in at least 95 out of every 100 families.

The coffee bean is constructed of fibrous tissues formed into tiny cells, visible only under the microscope. These cells contain the aromatic oils to which coffee owes its delicious flavor. Those oils quickly lose strength when exposed to air, which makes it necessary to keep ground coffee in a tightly closed container. Coming to the housewife in roasted form it is already cooked, needing only to be mixed with boiling water to get instantaneous solution, and a cup which cheers but does not intoxicate. The aromatic properties of the bean, and a substance known as caffeine which mildly stimulates, give the brew its distinction and its popular following.

When the fruit of the coffee tree ripens it is red, resembling cherries or cranberries.

The coffee bean, which we use, is the seed of the fruit. When the berry dries it turns brown. Normally each berry contains two seeds, flat on one side and rounded on the other, with the two flat sides snuggled up together, protected by a covering of parchment. Some of the berries contain but one bean, rounded in shape, and called a "peaberry." The bean has two coverings, the outside one like thin paper called the "parchment," and the inside one fine and soft as silk called "silver skin." Both of these coverings have to be removed before the coffee is roasted.



Coffee trees are planted in rows like an apple or peach orchard, and the fertile soil between the rows is kept clean by careful cultivation. The coffee harvest extends from May to September. The picking is done by men, women, and children, who strip the fruit from the branches into baskets, stripping off at the same time leaves and twigs, which are afterward sifted and winnowed out. After picking it is piled in heaps to dry, and later hulled and washed by various interesting processes.

Large two-wheeled carts, drawn by mules or horses, coming in from the plantation to the sheds, empty their cargo into a V-shaped trough, where the water from a reservoir mingles with them. After the berries have been thoroughly submerged, they rise to the surface in the next trough just below, which acts as a settling basin for material heavier than the fruit. From there the flow of water carries the coffee through concrete conduits to a hopper in the drying flats, which latter are tiled basins several acres in extent where the berries are laid out to dry in layers of from two to three inches in depth. It takes seven days of such process to prepare the berry for the final operation, hulling.

In those seven days the berries are raked together and spread out again several times, while covered by a canvas occasionally to heat them thoroughly. When completely dry they are taken in cars to the separator where the husks are blown off, and the green bean is sacked, ready for roasting, which is generally done in other countries than Brazil, for export uses. It is an interesting sight to see the great coffee flats filled with brown berries, and the laborers sweeping, piling, and mixing them under the blazing sun of São Paulo's clear blue skies. And it is a far cry from those large South American coffee plantations to the millions of American breakfast tables, from which the steaming brew is sipped.

A little journey through the fields of these large Brazilian coffee plantations, where the forty billion cups of American-drunk coffee originate annually, is of unusual interest. You will find there also a coffee-plant nursery, where the small plants are raised for transplanting in the orchards later on. As the sun is very hot there, the tender shrubs are first set in small baskets, kept in the shade of large trees until they grow strong enough to withstand the scorching sun. Thus the nursery there serves almost a directly opposite purpose of nurseries here, where young plants are perforce shielded in hothouses from the cold.

Coffee-picking, also interesting to observe, is done mostly by white pickers, instead of colored ones as in the cotton fields of the South, even though Brazil has its quoto of ex-slaves, too. Pickers on ladders can be seen for mile after mile along regular columns of coffee trees planted in a red-clay soil. Many hands are engaged in the picking process, stripping the twigs, and shaking the little pods to the ground from trees sometimes nine feet in height, even though the coffee plant is classed as a species of shrubbery rather than as a stately tree. After being shaken from the bushes to the ground by men, the berries are gathered up by women and children, to be screened of sand, earth, and other extraneous matter.

Coffee roasting plant.

There is a government experiment station at Campania, some distance to the south of São Paulo, in the heart of the coffee-growing region of Brazil. Not far from there is one of the largest coffee plantations in the world, with 6,000,000 plants on its broad acres. On the road from the government experiment station to that plantation is a bamboo-lined avenue, about five miles in length, a solid tunnel of bamboo trees, through which the sunlight filters in spots of golden light and green shadows. After entering the plantation itself, we pass through several miles of coffee trees before we arrive at the *estancia* and plantation sheds, where the invited guest is entertained with a free hand. The hospitality of the Brazilian is world-famed; in this coffee region, where the lord-proprietors are more opulent than the kings of Europe, the favored visitor is lavishly wined and dined.

But coffee is not served, generally speaking, in Brazil, where it is abundantly grown, as we serve it here, with a weak mixture of the bean diluted with rich cream. There

Coffee beans in their first operation after being brought from the plantation.

the morning cup consists of a little portion of strong, black coffee, and three or four times as much milk—not cream, which is scarce in that country. The rest of the day, it is served in the coffee houses of Brazilian cities in its pure and unadulterated state, without milk or cream, in a small cup, just a trifle larger than a good-sized thimble, strong enough to walk alone. Those coffee parlors are as numerous in São Paulo, Rio de Janeiro, and Santos, as ice cream and candy kitchens in the United States, where, for a few *mil-reis*, a person can coffee-bib the whole day.

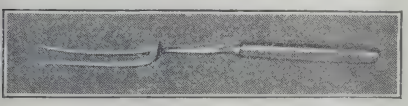
Most of these coffee plantations are financed in São Paulo, a city of more than 300,000 inhabitants. Foreign capital, of course, is heavily interested in the industry. There is a coffee exchange and all the other paraphernalia necessary to the conduct of such a large national business in several Brazilian cities, including Rio de Janeiro, which was formerly itself the great coffee port of the world before Santos took first honors from it. But much of the roasting of coffee is done in the United States.

Again, when the green coffee beans come into the roasting establishments of America, they receive another thorough cleaning before they are roasted in revolving perforated cylinders over a hot fire. This roasting process is necessary to develop the aromatic oils which determine the characteristic flavor of coffee. It calls for elaborate machinery and expert skill in judging when the beans have reached the proper degree of roast, after which process is completed the coffee is dumped from the oven into perforated coolers, where a blast of air passes over it. Before roasting, green coffee is graded by roasting small samples, ground fine in small electric mills, and "drawn" in the cup by pouring in boiling water. The tester places each cup of coffee on a round revolving table opposite the sample of roasted beans from which it is brewed, and tests the brew by both smell and taste.

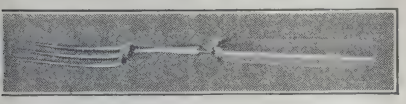
Coffee used moderately is not considered injurious to health, while in general the consumption of the product is the greatest in countries where civilization is most advanced. The Department of Biology and Public Health of the Massachusetts Institute of Technology, after two years of experimental work, has declared that coffee should never be boiled, recommending the "drip" or "filter" method. The container or serving pot, for the best results, for the brewed coffee, should be glazed earthenware, china, glass or agateware. And it should be served at once. It is not necessary to boil, even in using the old-fashioned coffeepot. The water in the pot can first be brought to a hard boil, after which the grounds are put in, removing the pot from the fire first. After standing two or three minutes, it should be separated again from the grounds into a serving pot and kept hot but not boiled until it is served.

Adding fresh coffee to old grounds spoils the taste. Used coffee grounds are of no more use in making coffee than ashes are in building a fire. Coffeepots should be kept clean, not only for the sake of cleanliness but to enhance the flavor of the brew. If these suggestions are followed those forty billion cups of the "universal drink" consumed in the United States annually will contain a distinctive aroma and delicious flavor, while wives will have no difficulty keeping their husbands at home.

# Chats with Office Callers

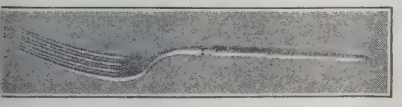


***The Crowd*** was discussing a certain man; when "he eats with his knife," said one—"he's a sword-swallower."



Said another: "It is not so long ago that most people were doing that."

There was consternation. "And *you* did it too," he said. The challenged party looked startled, thought, made to speak, hesitated, and finally said: "Well, of course, in poor families where they didn't know—"



"No, I don't mean poor families nor those where manners were not taught," said the author of the general indictment. "I know you came of poor family and I shouldn't wonder if your manners were just as poor, but you conveyed food to your mouth with your knife simply because you couldn't do it with the old forks they used to have. Do you remember the old straight two-tined affairs? They were intended only to pinion the piece of food to the plate. I can show you one now.

"Then there came the three-tined variety just as straight, and just as awkward as a means for conveying food. Here is one of those.

"Last of all the present curved, four-tined variety which is perfectly adapted to the uses described in the most meticulous book of etiquette.

"We have all kinds of forks now, sensibly made to fulfill their intended uses: salad forks, and the like. Our friend who eats with his knife is still under the spell of the forks of his boyhood days, that's all. He hasn't noticed the improved styles in table silver.

"Old-time knives were meant to be eaten with. You can see that by the spatulate tips they carried—regular shovel-like ends that could lift a hefty load."

❦ ❦ ❦

"Irish though I am," said ***the Man from New Jersey,*** "and all the generations before me, and my children after me, thank heaven, for I married an Irish girl, I cannot see the meaning of the way they link the Irishman and the Jew on the stage these days. Hang me if I can! First we had 'Abie's Irish Rose,' and it was very sweet and human-like and everybody liked it, and why not? It was clean. It was such a change from most of the things that were going on the stage just then. The critics were there with the water bucket, of course, saying that it wasn't much in the way of drama, and maybe it wasn't, but it had the elements of drama, which are life and love and clean ways, and so all the folks liked it. Then came 'Kosher Kitty Kelly'—and there you get it again, the Jew and the Irish girl. And then comes 'Hogan's Alley' along with them. I don't understand it, I don't. A friend gave me a list of plays and movies which he told me to look up—here's the names in my pocketbook—and he said it would be worth while seeing them, for they were all the Irish-and-Jew variety.

"Now, thinks I, once or twice is natural, but why the flood of these things? You can't fool the Irish and the Jews about each other by means of stage-plays. No siree. Ask anybody in New Jersey. So I asks my friend, and he says that there has been some kind of a hook-up between the authorities, whoever they are, but I don't believe it, unless it's a union against the K. K. K. in which case I'm with them, but not on the 'Abie's Irish Rose' or the 'Kosher Kitty Kelly' plan. My own idea is that they ought to lay off that stuff. Once in a while it happens. But not enough to fill a whole theatrical circuit and all the movie houses."

❦ ❦ ❦

"The truth is," said ***the Man in the Library,*** when the above was called to his attention, "I had given only passing attention to the union of Irish and Jews in recent plays. But I have been struck by the number of Jewish propaganda plays which have come out. 'Abie's Irish Rose' and 'Kosher Kitty Kelly' are doubtless approved by the theatrical overlords because these plays recommend the Jews, and do it very skillfully. But there are other more direct pieces of Jewish theatrical propaganda such as 'Humoresque,' 'Welcome Stranger,' 'The Immigrant,' 'The Wanderer,' and several others. Whatever the Jews are holding mass meetings about and bombarding Congress for, you will soon discover in certain plays. It is one way of getting the idea across to the public. 'The Immigrant,' for instance, simply dramatizes the arguments of the American Jewish Committee in their efforts to undo the American immigration law. As some one has remarked, you have to take off your hats to the cleverness which makes Americans pay at the box office for un American propaganda."

❦ ❦ ❦

"Do you notice," said ***The Man about Town,*** "how they are slipping women into the cigaret advertisements now? Just keep your eyes peeled as you turn over the magazines, and see how the young woman is appearing in the ads of various brands. The tobacco companies are deliberately fostering the use of tobacco by women. It is bad enough to have their press agents use the radio to tell us that cigarets are the most harmless form of tobacco, but when they portray girls of high school age and young débutantes as natural parts of their cigaret ads alongside the young smoker of the male species, I have a feeling that they are raising something against themselves which may prove very embarrassing. It will be interesting to watch how far this goes. I am curious to know whether the tobacco business is going to display the same brand of brains that the liquor business used."

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of THE DEARBORN INDEPENDENT, The Ford International Weekly, published weekly at Dearborn, Michigan, for April 1, 1926, State of Michigan, County of Wayne, ss.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of THE DEARBORN INDEPENDENT, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher, The Dearborn Publishing Company, Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, none; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding one per cent or more of the stock are:

The Ford Motor Company of Delaware; Henry Ford, Dearborn, Michigan: E. G. Liebold, Detroit, Michigan; Clifford B. Longley, Royal Oak, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: none.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders, who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRED L. BLACK,
Business Manager.

Sworn to and subscribed before me this 17th day of March, 1926.

[SEAL] EDGAR J. MATZ
(My Commission expires April 18, 1928.)

# Never Separated a Single Family

(Concluded from page 6)

they claimed was acting as a deterrent to a sufficient supply of Mexican labor.

Mexico, like Canada, is not on a quota basis, but the various witnesses insisted that this $18 charge, which is $10 more than under the old act, has been the prevailing factor in reducing Mexican immigration from 89,000 in the fiscal year 1924 to slightly more than 32,000 last year.

Five years ago the beet sugar interests had urged Congress to remove the then $8 tax; waive the literacy test and permit their labor representatives to enter Mexico and contract for peon labor.

The admission that these interests are still seeking to nullify the contract labor laws was drawn from Maddux when Representative Box pinned down that witness to tell the committee exactly what the sugar interests desired.

"Are you acquainted with the fact that they then asked for the remission of the head tax—the visé fee was not then in existence—and for a waiving of the literacy test, and a waiving of the contract-labor provision," Box asked Maddux, referring to the demands of 1921.

"I am," Maddux replied.

"Those were the three things that the people in the industry wanted then. They wanted the literacy test waived, the contract-labor provision of the law waived, and the $8 head tax waived. A great many gentlemen at that time told the committee they could not get the necessary labor with the literacy tests and the contract labor law barring their efforts to do so. Now, I want to know what circumstances have intervened to make you believe that you can get labor out of Mexico that is literate and that you can get it without violating the contract-labor law. In other words, why did you drop those two points in your liberalization?" Box asked.

Then, for the first time was disclosed the carefully guarded secret that the beet sugar interests never have abandoned their attitude toward the contract-labor laws. Several days previously Maddux had submitted a proposal that Congress create a board of three Cabinet members to "determine from time to time the necessity of importing a sufficient number of agricultural laborers into the United States to meet existing or pending needs."

After first stating that the beet sugar men do not now want illiterate Mexican laborers admitted, Maddux finally allowed that they still do want the privilege of entering Mexico and shipping out thousands of Mexican peons to the United States.

"In the memorandum of recommendations that we submitted to your committee several days ago, we included the word 'import,' which we thought embraced the right to contract for laborers on the other side," Maddux said.

Dangers of permitting such a practice or of Congress yielding to any other demands that would liberalize Mexican immigration were stressed during the hearings by Congressmen opposed to such influx. Representative Box showed how the average Mexican peon, accustomed to a frugal mode of living, menaces the standards of American farm labor and told of instances where Americans have been driven from their jobs because Mexicans would do the work so much cheaper.

The Texas member submitted statistics prepared by California municipalities which disclosed that the bulk of charitable budgets in many of the cities are being expended on Mexicans. For example, in Los Angeles, where only seven per cent of the population is of that race, the Bureau of Catholic Churches reports that Mexican families require at least 50 per cent of its budget, while 73 per cent of the city maternity funds are expended on Mexicans. Also that 43 per cent of all the city hospital cases there are Mexicans.

Various witnesses representing the beet sugar manufacturers testified that few Mexicans remain in the United States after their seasonal labor in the beet fields is completed.

This testimony was refuted in an emphatic manner by official figures from the Department of Labor disclosing that only 3,000 of the 32,000 Mexicans who entered the United States during the fiscal year ended June 30, 1925, have returned to Mexico.

Representative Box also submitted Census Bureau statistics showing that the number of foreign-born Mexicans residing in the United States has increased from 103,339 in 1900 to 486,418 in 1920.

Since the hearings on the Box bill were concluded, Representative Bird J. Vincent, of Michigan, has introduced a bill designed to carry out the requests of the beet sugar interests.

Outstanding among the numerous other bills seeking to modify our immigration laws are: The Jacobstein bill, patterned along the lines of the Perlman measure, but much less drastic; the Dyer bill to permit American-born Chinese to bring in wives from China; and a bill introduced by Representative Royal Johnson, of South Dakota, to permit aliens now living abroad who served in the American forces during the World War to enter the United States outside the quota provisions.

Numerous other bills are designed to correct alleged discriminations practiced against aliens by American consuls abroad or to permit entrance of certain small classes peculiarly affected by the law.

What the effect of all the pressure being brought upon Congress to modify the law will be is a difficult question to answer at this time. When Congress on May 26, 1924, adopted the law the sentiment was overwhelmingly in favor of a strict immigration policy.

So far this year, however, the only active stand in favor of a continuance of the present policy, other than that taken by some of the Congressmen on the House Immigration Committee, has been by the American Federation of Labor.

## Great Writers Who Have Failed as Novelists

IT MAY seem a solecism to declare such great writers as Carlyle, Froude, Shelley, Charles Lamb, Tom Hood, Henry Ward Beecher, and Walt Whitman were not successful as novelists—yet it is a fact that every one of these attempted novel writing, only to produce, in nearly every instance, a work outdone by far less gifted pens.

Usually the effort, as in the case of Carlyle, was but a single one.

The title of Carlyle's early novel was *Wotton Reinfred*. It recalls the *Sorrows of Werther* in its sentimentalism. Carlyle was learning to write, and the lesson seemed to come hard. Certainly it was not an auspicious beginning. The hero is plunged into a philosophy of despair through no cause, it would seem, save that he had been jilted by a lovely girl. The novel was never completed, the author seeming to have awakened to the futility of it when it was about three-quarters finished.

It would not be fair to call the *Two Chiefs of Dunboy*, by James Anthony Froude, historian, and biographer of Carlyle, a failure, for it is far from that. The work is full of action, and contains clever character delineation. But it does not measure up to his work in other lines.

Charles Lamb wrote a story, hardly long enough to be called a novel, entitled *Rosamund Gray*. It is hard to believe that this is not another of Lamb's whimsicalities, but its internal evidence forbids any such belief. It must have been a very early effort, but it is scarcely a credit even to adolescence.

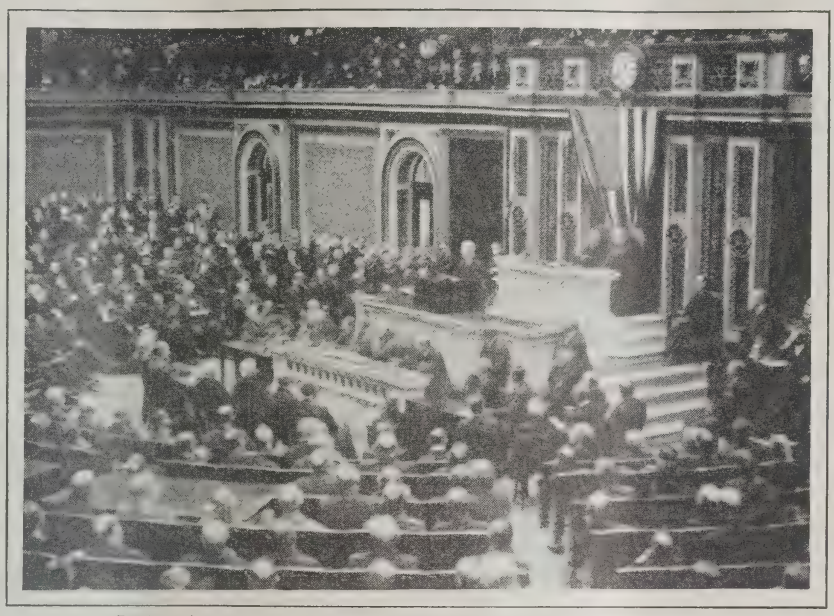
An unpleasantly melodramatic effort, yet with here and there certain blended qualities of humor and pathos is *Tylney Hall*, by Tom Hood. On the whole it is well that Hood never repeated the attempt. Posterity will remember him as the author of the *Bridge of Sighs* and the *Song of the Shirt*.

It is seldom that we think of Henry Ward Beecher as a novelist. Yet he wrote a passable achievement in *Norwood*. Mr. Beecher tells of his perplexity when called upon to write a continued story for a newspaper. He says that he was wholly unacquainted with the mechanism of novel writing and essayed the task required of him with some apprehension. *Norwood* has some grace of style and the flexibility that characterized Beecher's orations, but the story moves too leisurely for modern readers, and the incidents are approached by paths which readers of today would find somewhat tortuous.

There are two romances in prose by the poet Shelley—it is fortunate there are no more. One, *Saint Irvyne, or the Rosicrucian*, has all the faults of youth and inexperience. Some of the descriptions of natural scenery reveal the nascent genius of the poet, but some portions are very crudely written and it is a trifle ridiculous as a whole. *Zastrozzi* is quite as bad. These youthful performances excited the laughter of Browning, Swinburne and Rossetti, all Shelley disciples and Shelley enthusiasts.

James Hogg, known as "the Ettrick Shepherd," wrote verse a century ago which attracted much attention. Some of this verse is included in most anthologies. That he also wrote a novel will be news to many.

There are also Francis Parkman's forgotten novel, *Vassal Morton*, and Walt Whitman's first attempt at writing, *The Inebriate*, which lovers of Whitman would rather forget.



Many instances could be added to those given of eminent writers who have unsuccessfully essayed the art of novel writing. The search for these would probably reveal other instances equally interesting.

# Wilson Was Best and Worst Copy

(*Continued from page 2*)

Mr. Wilson knew that Colonel Roosevelt was seeking to engage him in a controversy, and had observed President Taft's failure to cope with Mr. Roosevelt's tactics in 1912. When urged to make rejoinders to Mr. Roosevelt's attacks, Mr. Wilson countered with a story. He said that there was once a political speaker who was not vicious enough in his attack on his opponent to satisfy his friends in the audience, when from the back of the room one of them yelled: "Call him a liar and make it a fight."

President Wilson knew that his style was not calculated to meet the tactics of Colonel Roosevelt any more than was Mr. Taft's. By not naming Colonel Roosevelt he sidestepped the personal issue. At the same time he thrust with a rapier whetted with words that left no doubt in the mind of the public as to whom and what he was attacking. He fully believed that he was putting Mr. Roosevelt at a disadvantage in tactics, and at the same time was effectively answering his attacks. But he never realized that at the same time he was dramatizing himself through this curious duel.

President Wilson never hesitated to take his demands personally before Congress.

While Mr. Wilson avoided the name of Mr. Roosevelt in the 1916 campaign, he did not use the same tactics in 1912. The reason for this was that in 1912 Mr. Taft was the object of Mr. Roosevelt's attacks. So absorbed was the Colonel in this battle that he almost forgot that Mr. Wilson was running. Occasionally the Governor gave him a gentle reminder. Watching President Taft and the "Bull Moose" leader committing political *hara-kari* in their assaults upon each other, Mr. Wilson added zest to the situation by throwing the spotlight on Mr. Roosevelt in a way that brightened the press copy of the reporters traveling with him.

***Wilson's Reply to the "Bull Moose"***

In the early morning hours of October 7, 1912, Governor Wilson's train drew into Pueblo, Colorado, one of the leading steel-producing cities of the West. The program called for three addresses, the first one in a theater at eight o'clock in the morning. It was a cold and an unearthly hour to break into the political arena. The air of the theater not only reflected the atmosphere of "the morning after," but it too was cold and clammy. Nevertheless the house was packed. Practically all of the seats were filled with laboring men dressed in their working jeans. Many looked as if they had just come from a night shift over at the steel plant. This type of audience appealed greatly to Mr. Wilson, who soon forgot the handicaps of the surrounding conditions as he warmed to his task. At the close of his address he drew a picture. It was so simple and clear, and so embellished with lights and shades of humorous sarcasm that the working men began to smile; first a laugh here and there, and then a roar of delight.

Governor Wilson had begun by saying that if he were a cartoonist he would draw a picture of the biggest monopolies of the United States standing up in line in front of Mr. Roosevelt, with the latter trying to lead them in a "Hallelujah Chorus." He compared Mr. Roosevelt's declarations against the trusts with their actions in the business world. Then he said that the United States Steel Corporation and other organizations of a like type were behind the "Bull Moose" leader's plans for controlling the trusts through the creation of a governmental body that would supervise them. He concluded with a description of the discords in that chorus if Mr. Roosevelt tried to control the monoplies in accordance with his previous declarations against their practices.

About three o'clock in the afternoon, when his special train stopped for a moment at a small town, one of the reporters brought to the rear end of Governor Wilson's private car a two-page telegram from the "Bull Moose" leader. Following the usual direct Rooseveltian style, the telegram said, "You had not the slightest foundation in fact for your charges. You have no business to make such a statement unless you have the proof, and if you have any proof, I demand that you make it public immediately. If you have not, then retract your statement, as the only manly and honorable thing to do."

As he began to read the Governor raised his eyebrows, slowly his lips set, and when he had finished he looked off into space for a moment. Then he slowly crumpled the telegram into a small ball, tossed it into a corner, and turning to the reporter with a nonchalant detached air said, "Oh, let him wait."

Here was news. The Wilson statement and the Roosevelt rejoinder caught the fancy of the newspapermen. They saw a clash between two fighters of the first order, one swinging the big stick, the other thrusting the rapier. That early morning audience in the theater had moved the schoolmaster to sketch a picture that caused the "Bull Moose" to shake his locks and roar as he had not roared before. The Wilsonesque method of reply for the time being was silence. That same night at Albany, New York, Colonel Roosevelt made the Wilson utterances the basis of a bitter philippic, and on the next day he kept hammering away on the Wilson statement.

Finally at Topeka and Kansas City, Governor Wilson, never deigning to mention the telegram, said to his audiences in a mild and mock surprised sort of a way that he "understood that Mr. Roosevelt was distressed by his suggestion the other day that the United States Steel Corporation was back of Mr. Roosevelt's plan for controlling the trusts." Continuing, he said: "Mr. Roosevelt interpreted my remarks to mean that the trusts were supporting him with their money. I was not thinking about their money. I do not know whether they are supporting him with their money or not; it does not make any difference. What I meant was they were supporting him with their thought, and their thought is not our thought. I meant"—and here he thrust again with all his energy—"and I say it again, that the kind of control which he proposes is the kind of control that the United States Steel Corporation wants."

***When Wilson Became Good Copy***

From this time on the campaign on the Democratic side picked up very much from the correspondents' point of view. Governor Wilson, with the dexterity of the dancing master and without any of the ordinary expedients of a politician, had become the best of copy.

After the campaign of 1912 a group of correspondents, numbering about a dozen, accompanied him to Bermuda for a rest, and remained with him at Princeton and Trenton while he was President-elect. His personal relations with these men were most cordial. In all the give and take over little accommodations and conveniences affecting a party while on a protracted journey, Mr. Wilson was the most courteous and considerate person of the group. He became very fond of most of the correspondents, but he never became reconciled to what he considered the flippant, irrelevant, unimportant stories which they wrote

about him and his family. Nor did he ever accept philosophically the fact that the papers failed to handle the campaign as if it were the serious thing he conceived it to be. He put the blame for this on the newspapers, and, except on one occasion, he refused to accommodate his campaign methods to existing journalistic customs.

The one exception occurred when the Wilson party was traveling to Atlantic City in a private car. One of the correspondents knocked at the door of the Governor's stateroom. Bidden to enter, he sat down opposite Mr. Wilson.

"Governor," he said, "I've got something on my chest and I want to get it off."

"All right," replied Mr. Wilson, "shoot! What's bothering you?"

"I find myself under the necessity of telling you that you don't practice what you preach," said the reporter.

*Taking the Governor to Task*

Governor Wilson looked up quickly and a little resentfully at the speaker.

"What do you mean?" he asked.

"I mean this: I heard your speech to the Young Men's College Club in New York, Saturday night. I listened particularly to what you told them about irrational obstacles. You said, very emphatically, that the college man's chief trouble in life after he leaves college is in learning to take cognizance of illogical facts; that the study of philosophy and logic in school tends to make a man ignore an obstacle if he thinks that, logically, it should not exist. You urged the college men in your audience to be on the lookout for such barriers and not to run into them blindly, but to examine them and perhaps to go around them, over them or under them. You declared that a man was of no use in any walk of life until he had developed this ability to deal with illogical facts."

"Yes, that's what I said," remarked Governor Wilson. "You've got the point. What about it?"

"Well, ever since you were nominated you have been ignoring an illogical fact," replied the correspondent.

"What illogical fact?" Mr. Wilson demanded.

"The illogical fact (as you view it) that American newspapers will not pay telegraph tolls on speeches, no matter who makes them or what they say."

Mr. Wilson turned and gazed intently out of the car window. There was a tense attitude that continued so long that the correspondent began to think he might have overstepped the bounds of his professional privileges. Suddenly Mr. Wilson threw his head back and laughed heartily, turned to the correspondent, slapped him on the leg and said:

*Why Newspapers Cut Down Wilson's Speeches*

"You've got me this time. Ever since the campaign opened I've been feeling uglier and uglier toward the newspapers because they have not published my speeches in full, but I haven't once tried to find out why. You know, I think a Presidential campaign is a mighty serious thing, upon which the people should receive every possible degree of enlightenment. I think the newspapers should print every word that each candidate utters."

"Of course you do," replied the reporter, "but the illogical fact remains that they won't pay telegraph tolls on those words. They can't afford it."

"Well, now that we've got that illogical fact out in the light where we can see it," said Mr. Wilson, "what shall we do about it?"

"That's easy. Get out some advance copies of speeches that can be sent to the newspapers by mail. If you'll do that every paper will publish them. Most papers will publish them in full. Instead of getting a few paragraphs you will then get columns. Send the speeches out ten days in advance so that papers at the farthest points can be reached in time to put the stuff into type in their slack hours."

"But I simply *cannot* make a speech to a stenographer," Governor Wilson complained.

"You'll have to," said the reporter, "that's the only way you can deal with this illogical fact. When we get back to Princeton on Wednesday take the rest of the week off. Get up advances on two speeches, to be delivered two or three weeks hence on our next western trip. Release one for morning newspapers, and, about two days later, one for afternoon newspapers. Select towns about 500 miles apart and use different themes."

"But I can't commit a speech to memory, and I *will* not read from a manuscript," said Mr. Wilson. "When I try to follow a prepared speech I always wander off onto something else, which comes into my mind at the moment. I like to work my way along through an address by the reactions I get from my audience."

"It doesn't make a particle of difference whether you deliver the prepared speech," explained the reporter. "All you have to do is to make *a* speech in the towns and on the days specified in the advance copies. Then, instead of talking to an audience of a few thousand, you'll talk to the whole country."

Mr. Wilson took the last two days of the week off and remained at Princeton, closeted with a stenographer. He dictated two speeches and they were turned over to the publicity director of the Democratic Committee and properly distributed. Both of them were used in practically all the daily papers in the country.

*No More Use for the Stenographer*

The next time Mr. Wilson and the correspondent met was at breakfast in the Wilson private car the Monday morning following their conversation on obstacles. The party had started from Princeton on a western "swing round the circle" late the night before. The Governor had to climb over a bench at the end of the table in order to reach a vacant place beyond the reporter. As he towered above the table while standing on the bench he bent over and shook his fist in the correspondent's face in seriotragic manner.

"Young man," he said, "you gave me the worst two days I ever had in my life, but, by Thunder! I'm never going to have any more like them. I've made my last speech to a stenographer."

And he had, at least so far as the 1912 campaign was concerned. Not another advance copy of a speech was prepared, and Mr. Wilson's resentment at what he considered the frivolous attitude of newspapers became greater and greater. It was only by the utmost restraint that he concealed it. Sometimes his feelings burst forth in spite of himself, as on the occasion when he resented persistent efforts to find out who was going to be in his Cabinet. One New York paper had withdrawn its correspondent because of his failure to discover this big news and had sent an older, less considerate man from the city staff with orders "to get the Wilson Cabinet." This correspondent went at Mr. Wilson as if the latter had been a precinct detective holding out a murder clew on a police reporter. At each journalistic conference the new man cross-examined the Governor, trying by a process of elimination through a word duel to get some inkling of Cabinet probabilities.

"I will not answer any more questions concerning the Cabinet," Mr. Wilson finally declared. "You seem to think that the chief reason for choosing a Cabinet is to furnish news for your newspaper. I take a different view. It is my responsibility and I consider it a serious one. I do not propose to be embarrassed by your speculation. In fact, sir, I do not consider my activities in this particular as any of your damn business!"

The correspondent, following the "sweating out" process sometimes applied to City Hall officials in New York, published Mr. Wilson's outburst, including the "damn." The Governor immediately wrote to the publisher of the paper, demanding the reporter's recall. The next day the correspondent was relieved and the man who had formerly been on the assignment was sent back.

*And So the Reporter Was Sent Back*

"What I cannot understand," said Mr. Wilson, in a confidential talk with a few newspaper friends, just before leaving for Washington to be inaugurated President, "is why all your questions all winter have been: 'Who will be in the Cabinet?' The name of the particular individual slated for a particular portfolio seems to be as far as your interest goes. Not one of you has ever asked me *what kind* of a man I want for this post or that post, although it seems to me that this question is more important than the mere identity of the person to be selected. I have spent hours considering the qualifications required for each Cabinet position and I would have been glad to talk on that subject at any moment; to have given you my view as to what sort of a man I believed should be Secretary of War or Secretary of the Treasury or Attorney-General. But you have never shown the slightest interest in that phase of the situation."

Schooled to pursue "spot news," the correspondents saw no further than the all-absorbing political and personal question, "*Who* is it to be?" It never occurred to them to ask, "*What kind* of a man is it to be?"

This illustrates perfectly the difference in the point of view between Mr. Wilson and the newspaper correspondents. He spent his days studying one line of philosophy, only to be doused with cold water at an apparently irrelevant, frivolous query of a reporter when he met the correspondents in conference. They, on the other hand, felt his contempt for their trade without knowing the reason for it, and resented his failure to give them his confidence. In varying degree this condition continued throughout his whole administration.

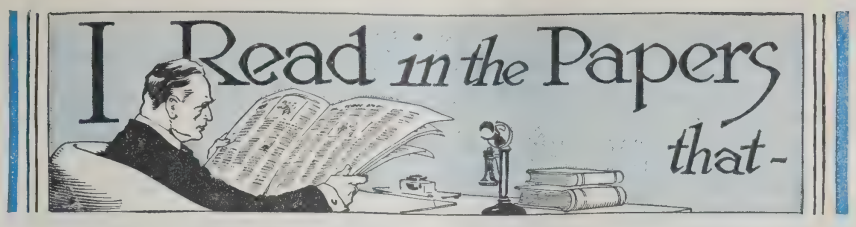
*Why There Was Trouble With Newspapermen*

Victor Murdock, newspaper editor, former Congressman and one time Chairman of the Federal Trade Commission, having closely observed Wilson's career in the White House, said recently that his difficulties with the newspapermen were due to the fact that he came to convictions and proceeded to action only after severe logical processes of thought, while the news writers had a desire to write fleeting news impressions into permanent history. "This news group in Wilson's day succeeded in fastening upon Wilson the reputation for intellectual arrogance."

"The newspaper mind," said Murdock, "is impatient with logical processes, and

newspaper unkindliness to Wilson was essentially the result of the newswriters' revolt against logical processes. Instinct, impulsive and eruptive, makes news. Logic doesn't make news. Woodrow Wilson was forever fighting instinct back with reason, inch by inch. The philosophy of current news has small space for that. But permanent history has a place for it."

After Mr. Wilson became President he discovered that the papers published his speeches and statements in full. The rule that newspapers will pay tolls upon and print everything a *President* says is just as inflexible as the rule under which they do as they please about what a *candidate* for President says. As President, therefore, Mr. Wilson could put across to the country whatever he wanted to say, without even seeing a newspaper correspondent himself. And because he was President the things he did (such as going to Congress in person to deliver his messages) were of themselves news that was also bound to be published irrespective of the attitude of the newspaper correspondents. By the use of these two instruments—what he did and what he said—Mr. Wilson successfully created and directed public opinion while ignoring the agencies by which he reached the public.



## Seeking to Know of What the Earth Is Made

PRECISION instruments have extended our field of accurate observation as regards the constitution of the earth's interior. Kelvin and Darwin found that the earth, considered in its totality, must be regarded as composed of material aggregates whose average rigidity is greater than that of steel. Late seismographic investigations have indicated that the earth consists of concentric layers composed of the same general type of material, at least through a depth of 3,000 kilometers. Research also has shown that the earth's material exists in a solid state to a depth of *at least* 2,500 kilometers in fairly well-defined layers. It has been pointed out that the outer layer is about 50 kilometers thick.

This solid outer layer consists principally of granite, syenite, diorite and porphyry. The average density (or specific gravity in terms of water as the standard) is 2.6. The middle layer is composed principally of a rock-like material rich in iron in those portions nearer the earth's center. The average density is 4.8. The inner layer has an average density of about 11.0.

In 1907, Dr. W. H. Pickering advanced the hypothesis that the moon was composed of matter dissociated from the outer layer of the earth. The conclusions of Pickering were based upon the assumption that the continents compose about one-quarter of the earth's surface.

Professor Stjepan Mohorovicic, of Jugo-Slavia, holds that the process by which the moon was detached from the earth required many millions of years. He finds that the material constituting the moon is composed not only of matter detached from the earth's outer layer, but also of comparatively small amount of that more dense material which composes the interior portion beneath this layer. Mohorovicic finds that the moon is composed of an outer layer of about 400 kilometers thickness and an inner layer of an average thickness of 1,340 kilometers. He gives the density of the outer layer as 2.7 and the value of 4.7 for the inner.

Dr. Norwood, headmaster of famous Harrow, has this to say about the religion of the modern boy:

"An interesting feature of the new type of boy is that he takes an earlier, and certainly more individual, interest in religion. It is, I believe, quite a natural development, due to the general atmosphere of discussion prevalent throughout the country, which boys and girls reflect very quickly. As far as my own experience goes, however, there is definitely less agnosticism among the clever young men and boys than was the case ten or twenty years ago. My own belief is that there is a reaction among young men at the moment against revolutionary and unorthodox ideas which have, perhaps, been overdone as a result of the war and the troublous times which have followed.

"This profoundly important change, which I have personally observed, though I have no evidence to justify me in saying that it is general, is one of the most remarkable experiences I have encountered, for the cleverer people have always been expected to disbelieve a great many things. It is not, however, an indication of a lack of interest in the boys themselves or a tendency to accept, rather than to find things out. Rather is it that the bias with which they approach the more important subjects is to defend rather than to pull to pieces, to conserve rather than to destroy."

the jazzbrows can learn something from the highbrows in music.

The objection to jazz is rhythmic monotony. The "rhythmic ingenuities" of jazz are highly conventional, and nearly always confined to the top-line of the music. The accompaniments are nearly always a plodding, mechanical emphasis of every beat, and the very negation of rhythm as a part of the musical language. Look at the fight-music in Tschaikowsky's *Romeo and Juliet*, the first dozen bars of the Introduction to Act III in *Lohengrin*, the dance of the puppets in the first scene of *Petrushka*, the first number in Schumann's *Carnaval*, and find what the highbrows may teach the jazzbrows in "gift for rhythm."

❦ ❦ ❦

Sir Arthur Keith, of the Royal College of Surgeons, is of the opinion that the proof of evolution is incomplete. In a lecture before that body he asked:

"Can any of the various forms of fossil anthropoids serve as a point of departure for the human family?"

Man, he said, had been followed backward in time through the Pleistocene period to the end of the Pliocene period by means of his fossil remains and by the trail of his stone implements. In the still older formations, those of the Miocene period, fossil remains of many kinds of anthropoid apes, had been found, but among them there was none to which the name human could be applied.

Now the distinctive features of man were his brain and foot, and in no case had geologists lighted upon any fragment of these parts. The Miocene anthropoids were known from the fossil remains of their teeth and jaws. All the evidence pointed to the teeth and jaws of early man as being similar in size and form to those of anthropoid apes. Hence, with only teeth and jaws at his disposal, an expert could not distinguish a possible human ancestor from the type which might have evolved into the gorilla or the chimpanzee.

Hence at the present time the student of man's evolution found himself in a state of suspended judgment.

❦ ❦ ❦

a Paris motor-car tire firm has adopted a new method of advertising. In a way the half-column which they have published in nearly every French paper seems to be a reflection on themselves. They have taken statistics from among their workmen, and have discovered that if their factory is typical of the whole of France the country will in a very short time become a desert. They have found that for every ten parents who die only three children are born. Out of a hundred workmen's families they found that sixty-two had no children, that twenty-seven had only one child, eight had two, while three had three or more. A hundred families, that is to say, two hundred people, would be replaced by fifty-five. If this continues, complains the advertisement, in time to come there will be no other course open to us but to employ foreign workers in the factories, while France itself will require emigrants from abroad if her prosperity is to be maintained.

❦ ❦ ❦

"Dixie" was the product of a Northern winter sixty-seven years ago, says the Syracuse *Post Standard*.

The discomforts of late winter did not then send as many people South as now, for Florida was farther away, and was not then so inviting. The frost-bitten ones could picture an Eden of ease on Southern soil, but they stayed at home and shivered until spring warmed their shriveled souls and bodies.

One of them did something more. "I wish I were in Dixie," he told his wife as he looked out upon the stormy streets of a Northern city. And then, being a minstrel, he wrote a song embodying that wish, a song that was to be sung by marching armies in a war that was soon to come.

It is not alone the weather which brings back a thought of what Daniel Decatur Emmett did. Recollection is prompted by the fact that public attention is being directed to a half-forgotten part of the song, which was not sung in the popular version, for the writer feared that it would be disapproved by the more orthodox of religionists. It went:

Dis worl' was made in jiss six days,
An' finished up in various ways;
Look away, look away, Dixie Lann.
Dey den made Dixie trim an' nice,
But Adam called it "Paradise";
Look away, look away, look away,
Dixie Lann.

# Life and Death Act on the Screen

(*Concluded from page 7*)

tures of this germ in motion never have been made, even by the most expert of microscopists. But Pillsbury, slowly winding his film through the projector, shows this infinitesimal death-bringer in all the details of its activities under whatever conditions the bacteriologist may demand.

These are the first sharp and clear images ever made of bacteria in motion, where the entire field, filled with any number, from one to a myriad, may be watched with ease, and every motion of each individual "bug" studied at length and repeated at will.

The discovery came indirectly as the result of Mr. Pillsbury's work in making motion pictures of flowers in the Yosemite Valley. Studying these blossoms, he became interested in the manner in which grains of pollen, entirely invisible to the unaided eye, penetrated the stigma and then the ovary of the flower, resulting in the production of seed and the perpetuation of the species. His first work to this end was to study, through the microscope, the passage of the pollen grain into the stigma of the sweet pea, then the extrusion of the tube of protoplasm from the grain, and the entry of that tube into the ovary of the flower.

Pillsbury about to crank out a few feet of motion pictures, when interrupted by a friendly bear cub.

Next he tried making motion pictures of this process through one microscope, using the entire flower in the process. As he worked, he found two microscopes necessary, and at length succeeded in synchronizing a pair of these instruments with a motion picture camera equipped with a special lens of his own devising.

When he had gone this far, he saw that the blossom did not furnish a suitable background for the moving pictures of the activity of the pollen grain. Then he placed the pollen grains, freshly gathered, in the little glass stage, and introduced to them an almost microscopic drop of the fluid found in the stigma of the sweet pea. The pollen grains in the slide performed exactly as others had done in the stigma of the flower. First, the grain enlarged abnormally, racing about the glass slide as if endowed with life; then, suddenly, the tube of protoplasm shot out, wandering about in search of the ovary of the flower, and then the pollen grain died. When Pillsbury threw this picture on the screen, he had the first motion picture of the beginning of life in the vegetable kingdom. Later, he introduced the ovary of the flower into the tiny stage, with the pollen grains, and made pictures of the complete process.

Other flowers were similarly pictured, and the results led the experimenter to try his synchronized microscopes and camera on bacteria, with the result that it is now as easy to study cultures of the deadliest of bacteria on the screen as it had been difficult to follow them with the eye glued to the microscope before Pillsbury linked the lenses into a tremendous magnifying power. By injecting solutions of various kinds into the "stage" on which the bacteria are performing, Pillsbury has obtained some very interesting results, but these experiments are left to the bacteriologists and the physicians who may thus obtain a permanent record of the effect of each drug on the bacilli of the various diseases studied.

When the results of Pillsbury's work with the pollen grains became known, the facilities of the botanical department of the University of California were opened to him for further experimental work and for the development of his discovery, under the helping hand of Dr. T. H. Goodspeed, associate professor of botany, and there the persistent photographer developed his method of putting disease germs into motion pictures.

Incidental to the work with the pollen grains and the making visible of the beginnings of life in the vegetable world, was the appearance clearly to the eye of the nucleus of each grain. Botanists had known, of course, that, in every pollen grain, there is a nucleus, but it had not been seen before, owing to its identity of color with the remainder of the grain. When the Pillsbury motion pictures are enlarged, however, this nucleus becomes visible, and botanists have the opportunity to observe just what happens to it when the protoplasm is extended into the ovary of the flower, a step in the production of life which they had not previously been able to see. Development and motion of the fertilizing protoplasm also are plainly shown.

In the pictures as projected on the screen, the pollen grains appear about the size of silver dollars, and the tubes of protoplasm are from one-quarter to one-half inch wide.

Pictures of single pollen grains and of a single bacillus have been enlarged to the size of footballs, but for all practical purposes, enlargement to the size of an egg is sufficient for study, though it does give the lay observer a thrill to see a germ as large as a derby hat go dashing erratically across the screen, particularly when he has been warned that he is about to see some of the deadliest of bacteria in action.

The Pillsbury discovery is to be devoted to the uses of bacteriologists, botanists, zoölogists, biologists, and the medical profession in general.

## When the Broker Breaks the Law

"I'LL give you a mighty nice commission if you'll place $200,000 worth of the new issue of Elko bonds that I'm handling," the broker suggested.

"How much?" the salesman queried.

"Ten per cent."

"And where would my selling territory be?"

"You can have the whole State of Massachusetts outside of the city of Boston."

"I'll take a shot at it, on those terms."

"Of course, I'll forward the bonds to you, you'll sell them, and turn over the money to me, and I'd have to have a bond for $50,000 at least, to provide that you'd account for all money taken in, and return all unsold bonds on demand," the broker suggested.

"Well, I'll give you a bond on the Ajax Surety Company, if that'd be satisfactory."

"Quite so."

The salesman started in, did a flourishing business for a few months, and then departed for parts unknown and inaccessible, and without returning the more than $40,000 which he had received from purchasers of the bonds.

The broker promptly called upon the Ajax Surety Company to make good the resulting loss.

"Did you comply with the requirements of the Massachusetts law in reference to non-resident security salesmen?" the Surety Company demanded.

"I did not," the broker was forced to admit.

"And I presume you are aware that the Massachusetts laws say that it is unlawful to sell securities in the state without complying with the requirements of the law in all respects."

"Yes, I believe that is true."

"And, that being true, we will not recognize the bond, nor pay you anything on account of your alleged loss."

"Crack on, as fast as you like."

And the Surety Company was quite safe in taking this ground, as, in a recent Massachusetts case, the evidence showed that *X* employed *Y* to sell intoxicating liquors in territory where such sales were unlawful, *Z* gave a bond that *Y* would account for the liquors and money received by him, *Y* failed to account for 1,000 dozen bottles, *X* sued *Z* on the bond, and the Massachusetts Supreme Court ruled that X could not collect on the bond, on the ground that the employment was illegal.

"It is established that a party to an illegal contract will be left by the law where the law finds him. A collection of authorities on that point is not necessary. It is also established that a contract for a single consideration is wholly void if that single consideration is paid in part for an illegal act," says the Massachusetts court, and the same rule has been laid down in Kansas, Missouri, New Hampshire, New York, Vermont and Wisconsin.

In a few states, however, including South Carolina and Ohio, the courts have ruled the other way on the ground that the agent, having received money which belongs to the principal, will not be permitted to retain the money on the ground that the transaction in which he received it was contrary to law.

# What's the Matter With Jim?

(*Concluded from page 8*)

he and a group of smaller boys found a small stick of something beside the construction work on a new road. There was an argument about whether it was dynamite or a piece of carbon from the street light. The boys had a bonfire going, and Jim said he would prove that their find was dynamite.

The experiment was a complete success. When Jim regained consciousness in the hospital this time he was minus one eye and one finger. He tells me that this doesn't worry him at all. He can drive faster with nine fingers and one eye than most fellows can with a complete set of each.

Jim didn't go back to the factory after this. His parents didn't know what he was doing, or what to do with him. One midnight they received still another phone call. Jim was in jail. He hadn't been doing anything in particular—just driving with three other boys at high speed along a country road, without lights. Jim pleaded guilty when his case came up, and the judge, finding that none of the boys had any regular occupation, sent them all to a reform school.

That's where I got acquainted with Jim. It is a hobby of mine to visit reform schools. I have studied their methods in England, Ireland, Scotland, South Africa, and in practically every American state. Essentially they are all alike. They have fine buildings and beautiful grounds and the best of intentions and lots of boys to reform. And they don't reform them. I have gone into the official reports, and talked with the boys themselves, by the hundreds. I have found that the reform schools live up to their names in less than five per cent of cases.

When I met Jim in a Pennsylvania reform school he interested me enormously. I thought, "Here's an ideal living laboratory for experimentally working out the problem of the delinquent boy." I met his parents, and when they asked me why he was always in trouble, I said I'd try to find out. He was paroled, and I hired him as my chauffeur. Jim doesn't know he is an experiment. But he is having a wonderful time. He always tries to pass every car on the road, and beat all the trains if we are running parallel to the tracks. I am not having quite so good a time. I am sixty-three years old, and have been in two wrecks myself. I have a better memory and more vivid imagination than Jim, with his speed mania. His fondest dream, I think, would be to tune up an old automobile and race an airplane with it.

When I told him the other day that I had to go on business to the Pacific Coast, he promptly said, "Fine. I'll drive you. I'll put a new fast head on the engine, and we'll beat the best train time by half. I'll save you two days."

"No you won't!" I remarked. "I've gone through a fence and over an embankment and been hauled out from under my car, just the way you have. But I'm less anxious to repeat the experience. Besides," I added, "we'd be arrested before we got ten miles from Philadelphia."

"Tell you what," Jim came back. "We'll get the Philadelphia Sesqui-Centennial people to fix it up for us. Gee! Bet they'd *pay* us for it. Save you time, and your railroad fare too, and pay you money! They'd do it for an advertisement of the Exposition. A record-breaking run from Philadelphia to Los Angeles! They can get the police to clear the way all across the continent, and we'll do three thousand miles in forty hours. I'll drive without sleeping, and we'll only stop for gas and oil, and we'll eat as we drive."

Judge Henry Neil, author of this and other articles in THE DEARBORN INDEPENDENT, discussing a manuscript with Mrs. Wallace Reid.

Jim isn't just talking. He'd try it if he had half a chance; he'd set out to average 75 miles an hour in an automobile all the way from Philadelphia to the Coast—and if anybody could do it, Jim could. He drives like a demon, and knows more about automobiles than any mechanic I have ever met.

As a living experiment in the causes of juvenile delinquency, Jim has taught me a lot already. He is congenitally incapable of understanding anything but play. A great number of the juvenile delinquents that I have talked to in reform schools are just like Jim. They get into magnified mischief, and finally into ways of crime, and they don't realize they are doing anything but play. The childish desire to have a good time is their only fault. We have got to do something about them, it is true, but we can't do it by punishing them like adults when in fact they are still only boys.

The whole country is excited these days about the scandal of crime. We have got to seek one of the roots of that evil in juvenile delinquency. Today more than 78 per cent of robberies are committed by youths under twenty-one. In several of our large cities the average age of murderers is twenty-one. Some of the most atrocious crimes of the last year have been traced to criminals in their teens. To check this tendency we must check the spread of juvenile delinquency. Certain classes of juvenile delinquents, like Jim, are less easily reformed than they are redirected. You can't make them grow up past the play age if they are still in it. You can't make them see the difference between harmless play and mischief that borders on crime. If society doesn't give their play-spirit free rein in harmless ways, city conditions will lead them into wayward habits.

Jim cannot be interested in anything that is not a game. His father asked me: "What am I going to do with Jim? All he does is fool with automobiles, and get himself arrested. He doesn't earn enough to keep himself. Must I keep him all his life?"

I said, "You must either keep him playing, until he grows up, or the state will keep him in jail."

So Jim's father has killed all the chickens, and turned the henhouse in the back yard over to Jim for a garage. Jim has made it into a machine shop, and when he isn't driving my car, he spends all his time there rebuilding junk cars. He'll buy two or three cars at $25 or $35 apiece, and put the best parts together, and I'll give him a little money to buy tires and batteries and other needed parts, and pretty soon he'll have a neatly painted, glistening monstrosity that will deliver enough speed to please even him. His father's back yard is full of hybrid cars and junk. Jim sells some of his weird creations, and he often sells some of the discarded metal from a car for more than the car itself cost him.

But he won't work for wages at a regular repair job in a garage. That isn't play.

As I have listened to the cases of children in juvenile courts in all parts of the country, I have wondered at the number that were charged with violating the law when they were really only children trying to play. Often their play had led them into waywardness only because in their environment there were no harmless methods of play available.

I have explained this to Jim's parents, and they have stopped trying to make him act like a man. At his age he is only part boy and part man. Society can learn to handle such cases as Jim's father has. It can learn to distinguish between children with an exaggerated craving for play, and the real juvenile delinquent who may be amenable to punishment or deterred from crime by prompt and drastic enforcement of punishment upon others. It can learn to direct the energies of boys like Jim into activities that they consider play, and then no other restraint upon them will be needed.

But now that Jim is provided with enough money and sympathetic coöperation for the maintenance of his weird machine shop, he doesn't get arrested any more.

Of course the speed craze may break out in him again. I am leaving shortly for Los Angeles—by train. I really wouldn't be surprised if I found Jim waiting for me at the station there, in a mud-covered automobile, with a record-breaking transcontinental trip behind him. His childishness may make him famous yet. Or it may make him a public nuisance. But if Jim ever has to be locked up for the safety of the rest of the American people, I make just one plea. Don't let's put him in a typical reform school and try to make him over into something that he isn't.

# A Dance a Week

## THE LANCERS

### A Graceful Square Dance—First Two Figures

### FIGURE ONE

ADDRESS PARTNERS, THEN CORNERS

First four forward and back..... 4 bars

Partners join nearest hands, gentleman starting with left foot; walk forward three steps. On the fourth count, raise the right foot to the heel of the left. Starting with the right foot, walk backward three steps. On the fourth count, bring left foot up in front.

And forward again and turn the opposite..... 4 bars

Walk forward four steps, give both hands to the opposite, and turn once around, and return backward to place.

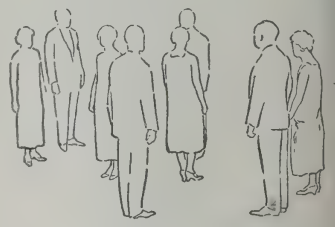
First couple promenade between the opposite and return on the outside..... 8 bars

First two couples cross over. First couple cross hands, second couple separating to allow the first to pass between. Returning to place, second couple cross hands, and the first couple separate.

All balance to corner and turn partners..... 8 bars

All turn, face corner; each dancer take four steps toward each other, and four steps backward. Then all face their own partner, give both hands and make one complete turn to place.

The side couples then start the movement. Repeat all, until every couple has passed through. Play four times.



### FIGURE TWO

WAIT FIRST EIGHT MEASURES

First four forward and back..... 4 bars

Turn ladies to center, facing partners..... 4 bars

Both couples join hands with their partner, and walk four steps to the center of the set. The ladies turn facing their own partners, while the gentlemen make a slight bow, and walk backward to their original place.

Chasse right and left..... 4 bars

The two couples who still face their own partners, begin each with the right foot, slide four steps to the right side, then four steps to the left side. They are still facing partners.

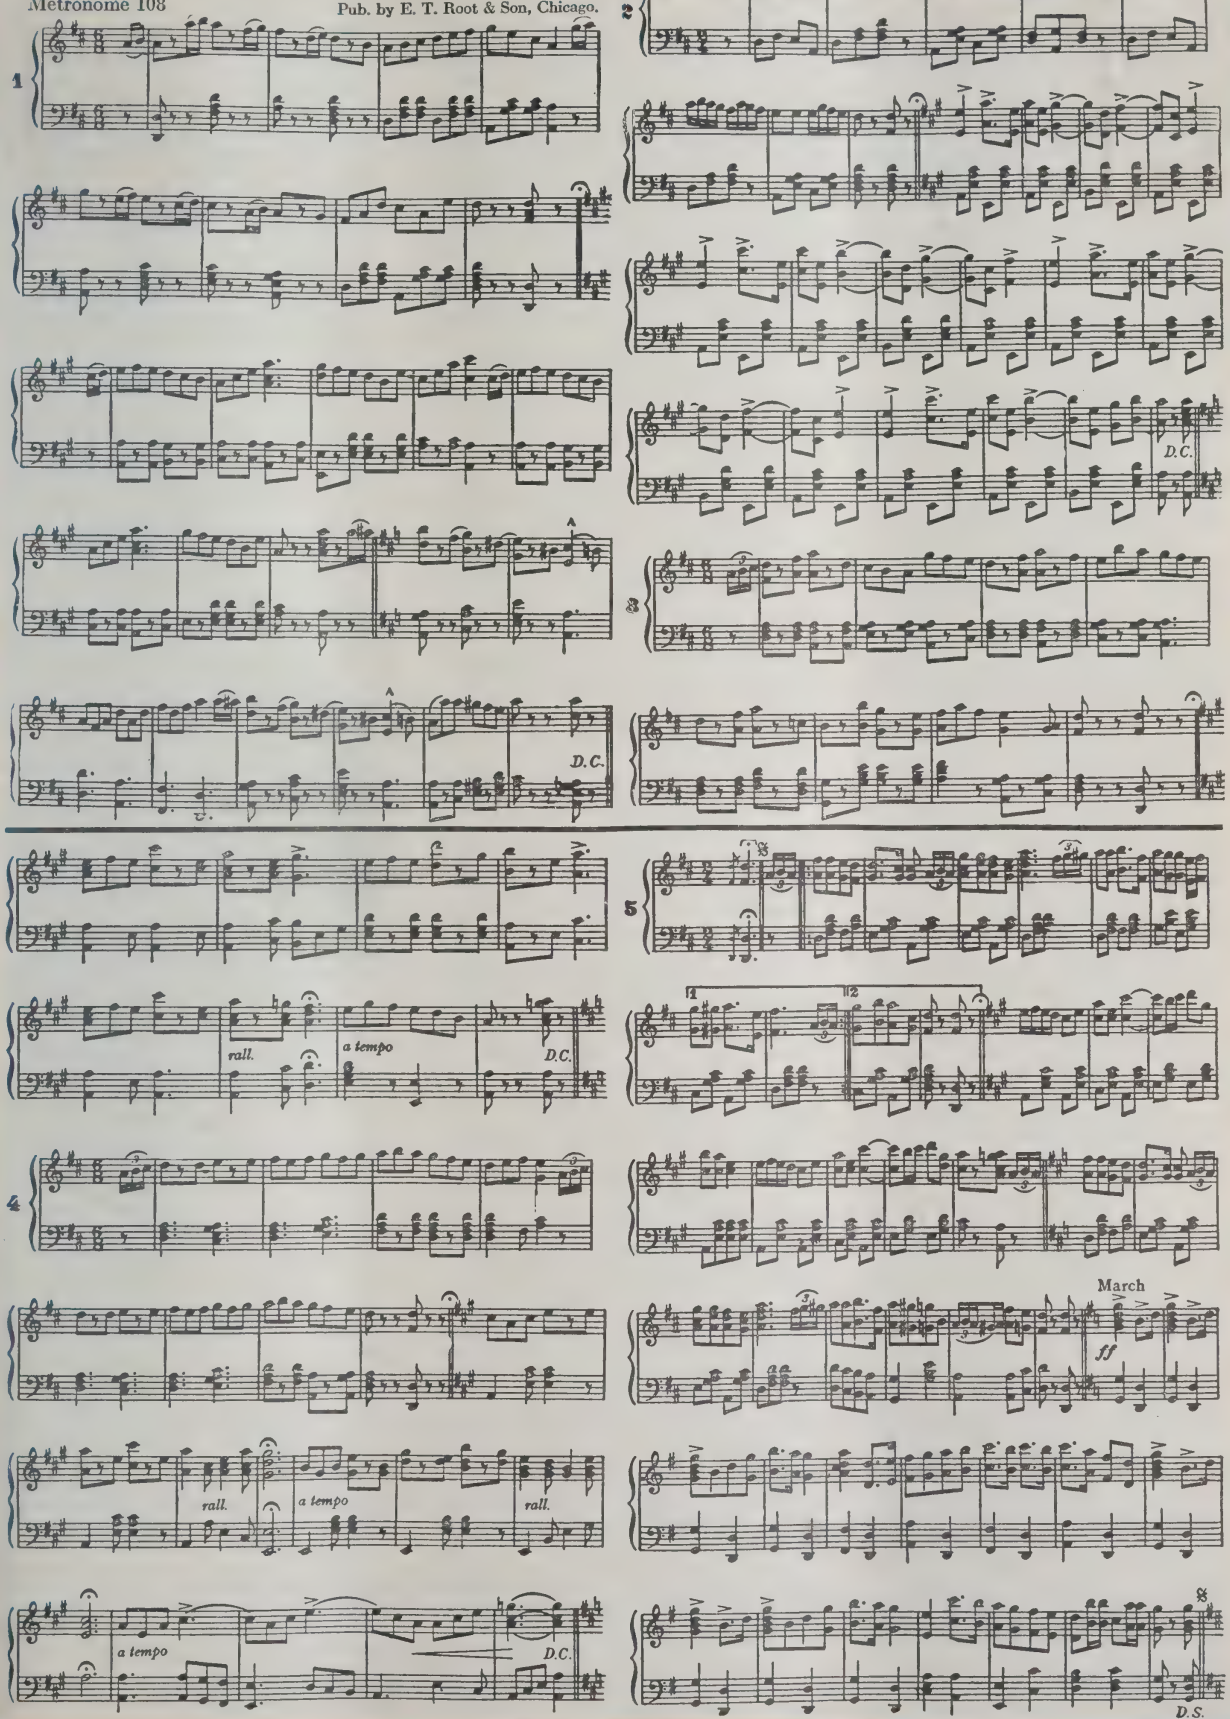
Turn partners..... 4 bars

Gentlemen step forward, give both hands to partner, and turn to place.

Side four separate to heads, forward and back..... 4 bars

Side couples separate from their partners, join hands with the first four, forming two straight lines, four persons in each line. From this position the dancers, with hands joined, walk forward four steps, back four steps, forward again and

Turn partner to place..... 4 bars



Play four times, two for the head and two for the sides. In forming the lines on the side, the first four separate.

NOTE—This concludes the first two of the five figures of The Lancers. The remaining three figures will be presented in next week's issue. The piano accompaniment for the complete dance will be found on the page facing this; next week the music will consist of the violin selection for the same piece.

(*Continued from page 15*)

informed General Rufus King, then American minister at Rome, of Surratt's whereabouts and of the details of a confession he had made. General King advised the Papal Government of these disclosures and by order of the Pope, the following instructions were issued:

November 6, 1866.

Colonel: Cause the arrest of the Zouave Watson, and have him conducted, under secure escort, to the military prison at Rome. It is of much importance that this order be executed with exactness.

The General, pro-minister, Kanzlei.

Lieutenant-Colonel Allet,
Commanding Zouave Battalion, Velletri.

Lieutenant-Colonel Allet telegraphed as follows:

Pontifical Zouaves, Battalion Headquarters,
Velletri, November 7, 1866.

General: I have the honor to inform you that the Zouave John Watson has been arrested at Veroli, and will be taken tomorrow morning, under good escort, to Rome. While he was searched for at Trisulti, which was his garrison, he was arrested by Captain De Lambilly, at Veroli, where he was on leave.

I have the honor to be, General, your Excellency's
Very humble and obedient servant,
Lieut.-Colonel Allet.

His Excellency, the General-Minister of War, Rome.

PONTIFICAL TELEGRAPH
Velletri, 8:35 A.M. Nov. 8, 1866.

His Excellency, the General-Minister of War, Rome:

I received the following telegram from Captain Lambilly: At the moment of leaving the prison, surrounded by six men as guards, Watson plunged into the ravine, more than a hundred feet deep, which defends the prison. Fifty Zouaves are in pursuit.

Lieut.-Colonel Allet.

The story of these three days cannot be more graphically related than by Surratt himself: (Interview with Surratt—Boston *Sunday Post*, April 3, 1898.)

"In the meantime I was confined in a cell in the old monastery. The second day after my arrest, or rather the second night, a messenger arrived from Antonelli directing the officer in command of the post, the Baron De Serappo, who you will remember married Miss Polk of North Carolina, to have me sent to Rome under heavy guard the moment the summons was received. I was awakened at four a.m. by the rusty key grating in the lock of my cell, and by the light of a flickering lantern I saw that my untimely visitors were an officer and six soldiers, all heavily armed. At once I knew what it meant, and when the lieutenant in command ordered me to dress at once in order to go to Rome I at once made up my mind that, let the consequences be what they may, I would not go to the Eternal City.

***He Arranged a Plan of Escape***

"While dressing I mentally arranged a plan of escape. This old monastery was built on the side of the mountains, nestling on one side, and the west side was directly over a precipice over a hundred feet high. A wall four feet high guarded the court yard. I was determined to break away from my captors and go over the precipice. When I was finished dressing I was placed in the center of this guard and we slowly ascended the stone steps of the old building, worn smooth by countless feet of many generations of monks. We reached the court yard and turned towards the left. Just as we reached the point I had selected for my attempt I made a break for liberty, and running quickly across the court yard jumped on the wall. Gathering myself for the attempt I took a long breath and jumped into space, doubling my legs slightly under me as I did so. About thirty-five feet from the top of the precipice there was a bare ledge of rock jutting out from the face of the mountain and about four feet broad. By great good fortune I landed safely on that ledge."

***A Fearful Leap for Liberty***

Surratt was asked whether he knew of the existence of the ledge or landed on it by accident.

"Know of it?" was his answer. "Why of course I knew of it. Do you think I would have been such an idiot as to jump over a 100-foot precipice to certain death in that manner? Many and many a time my comrades and myself in hours of idleness would lean over that precipice and wonder how many feet it was from the wall of the court yard to the ledge, and it was an open question as to whether a man could jump from the wall and land safely on the ledge. While dressing I was determined to make the attempt. It makes my blood run cold to think of it now, though. However, I managed to land on it safely and my legs doubling up under me, my head struck the bare rock with fearful force."

After describing the scene of wild confusion and surprise by his sudden break for freedom and the attempt made by his guard to shoot him, Surratt continued. "I was brought back to my senses by the reports of their rifles from above and the bullets flattening themselves on the bare rocks unpleasantly near my head. Dizzy and sick and shaken, I managed to gather myself together and crawl out of danger and gradually make my way down the side of the mountain to the little town which nestled at its base. Running along the main street of the town I ran directly into the arms of a detail of Zouaves. They were as much surprised as I, but I had the advantage of being on the alert. With me it was almost a matter of life and death. Doubling quickly on my tracks and expecting every moment to be hit by some of the bullets which were flying around my head, I ran like a frightened deer; through alleys, down dark streets and across lots I sped, and managed to elude my pursuers.

"In the meantime the entire town was in an uproar. Everyone had the alarm, and all the gates were guarded. Selecting a good point I managed to get over the wall and headed down the white Italian road toward the coast. I should have said at the beginning that all this took place during the early hours of the morning. It was four a.m. when I was aroused and told to dress. By the time I had left the town a few miles in the rear, the sun was high in the heavens and I was congratulating myself on my three escapes when I was suddenly startled by the sharp command:

"'Halt! Who goes there?'

"'Friend,' I answered in my best Italian, recognizing that I had run into a Garibaldian camp. Glancing at my papal uniform, the outpost was by no means reassured. In the meantime I had raised my hands above my head. Bringing his rifle to his shoulder he was pressing the trigger unpleasantly hard. Raising my hands even higher in the air I sang out to him 'Lower your rifle, man; can't you see my hands are up?' Still covering me with his rifle he ordered me to advance within a few paces of him and called out lustily for the corporal of the guard. That officer came on the run, and seeing my rig called for the sergeant of the guard. He no sooner caught glimpse of my dress than he called for the officer of the guard. To make a long story short, I was soon surrounded by a mob of Garibaldians of all ranks and sizes. When I told them that I was an American, a deserter from the *Papilo Guardo* and wanted to get to the coast, they treated me with the greatest kindness."

It was the third of November when Surratt escaped from the Papal Zouaves. On the sixteenth, having made his way to Naples, he there represented himself to the British consul as a Canadian citizen and obtained, through the aid of the consul, passage to Eygpt. But the American Consul of Alexandria, having been informed of his destination through the authorities in Naples, boarded the vessel upon its arrival there and placed Surratt, easily recognizable in his Zouave uniform, under arrest.

Surratt remained in an Egyptian government prison in Alexandria from November 27 until December 21, when a naval vessel, the *Swatara*, dispatched to that point, received him in chains and sailed for the Washington Navy Yard. The *Swatara* was quite small and the commander was in a quandary just where to put his prisoner. According to one of the officers on board, the "commander finally concluded to relinquish his bathroom, which was outside his cabin, with a door opening on the spar deck, and it was fitted up as a stateroom, and the prisoner made as comfortable as could be." (Geo. D. Barton, New York *Sun*, May 20, 1916).

***Surratt Is Sent Back to Washington***

Two months later, after storming through heavy seas and a hard gale on February 21, 1867, Surratt, who was a wretched sailor and had suffered greatly from seasickness, was again in Washington, facing an indictment in the criminal court for the District of Columbia for the murder of Abraham Lincoln.

On June 10, 1867, his sixty-one day trial began. Few murder trials have been more spectacular or harder fought. Joseph H. Bradly, Sr., Surratt's leading counsel, lost his temper and challenged the judge to a duel. While in Washington, St. Marie, the fellow-Zouave who had betrayed him, was

"in constant, though apparently groundless, terror of being assassinated," and when St. Marie suddenly appeared on the stand to testify, newspaper correspondents present noted "a single, deadly glance passed between him and Surratt."

More than two hundred witnesses were examined, some of whom testified that Surratt was in Washington on April 14, 1865, the day of the assassination. But the defense was able to impress eight of the jury, seven of whom were southern born, that Surratt's alibi was sufficient for acquittal. After three days' balloting the judge was informed that the jury was divided and "could not possibly make a verdict." They were dismissed and Surratt sent back to the old Capitol prison, where he remained until June 22 of the following year. He was then released on twenty-five thousand dollars' bail.

Three months later, the prosecution, realizing the apparent futility of proving that Surratt took part in the assassination of President Lincoln, attempted to press charges of conspiracy and treason. It was then learned that the two-year limitation for such an indictment made a trial on these charges impossible and the court freed John Harrison Surratt from further duress.

After attempting a profitless lecture tour, he settled in Baltimore and for many years was employed by one of the Chesapeake steamship companies. The remainder of his life was uneventful, and his death occurred early in May, 1916—fifty-one years after it would have taken place had he been tried by the same tribunal that sent his mother to the gallows.

Surratt was not inclined to talk of his experiences, and few who met him ever knew that behind his piercing gray eyes, deeply hidden beneath heavy brows, there was the memory of hairbreadth escapes rivaling in romantic interest and dramatic detail those of the wildest fiction.

The material in this story was obtained from files of the newspapers of the period, the official reports of the Surratt trial issued by the Government Printing Office in 1867, and an interview with Surratt which appeared in the Boston *Sunday Post*, April 3, 1898, the New York *Sun*, May 20, 1916, and *The Assassination of Abraham Lincoln* by Oldroyd.

## Woodrow Wilson's Gift

AS President Wilson was leaving Billings, Montana, three barefooted lads of 12 or 14 chased alongside the last car of the train. "Hey, Mr. President, take this!" shouted one, handing up a little flag. Mr. Wilson took it. "Here, Mr. President, take this!" cried the second. His gift, a yellow chrysanthemum, was also accepted. These two boys, radiant with grins, dropped out of the running, leaving the third with gloom pictured in his face. He had nothing in his hands to give.

Suddenly, when it seemed that he could no longer maintain the increasing pace, his freckled countenance beamed. He reached into his pocket and held something tiny toward the President, panting: "Here y'are, Mis-ter—Wilson!" The President's hand closed over the little fellow's. When it came away it held a worn silver dime.

"All he had!" said the President gravely regarding the coin. "That's America. It gives all it has. I'm going to keep this!" Then he swung his cap to the happy youngster until the town vanished in the distance.

# Housekeeping in Our Paris Flat

(*Concluded from page 4*)

unteered to interpret for her. So Mrs. Bindle got what she wanted, and she told the "lovely lady" what a hard time we were having. "I am the housekeeper for Mrs. Dillon. Won't you come and talk to her? We never hear anything but this furrin' parleyvooing!" said Mrs. Bindle.

At any rate, we did not chide her for her forwardness, and we had an honest-to-goodness dinner that day.

Several days later my wife was arranging flowers on the window ledges when a lady passing in the street stopped and spoke to her, making herself known as the lady who had interpreted for Mrs. Bindle. My wife said, among other things in the conversation, that she had a longing for a cup of American coffee; she couldn't get used to French coffee.

Two days after there came to our door six ladies bringing packages, led by our American "lovely lady." They brought a coffee pot, American coffee, cream, and cakes, just an old-fashioned American surprise party, and what a time they had at the coffee feast that afternoon! They were all Americans who had lived in Paris some years, quite charming women. That was the beginning of our acquaintance with many of the 25,000 American permanent residents of Paris.

But Mrs. Bindle fell into utter hopelessness. She could not learn the French names of foods. The French money system was a horror to her and the instigator of a nightmare when she went to bed. She complained that the "centimes" were driving her crazy. There are 100 centimes in a franc; the smallest French coin is a 5-centime piece with a hole in the center, worth at the time of writing one-fifth of an American cent. Nothing can be purchased with it, but it is used in making change.

At the end of two months I put Mrs. Bindle on a train bound for Calais, and pinned on her a card in French telling her identity and destination and bespeaking kindness for her. She arrived safely at her home in the west of England and I was told by her parish rector that she has given daily thanks to the Almighty ever since for bringing her out of France alive.

Then we installed a French housekeeper, one who knew not one word of English, and from that time to the end of our stay in the flat life moved rhythmically for us.

She undertook the entire management of the kitchen, dining room, and the cleaning and arrangement of all the rooms. She did all the catering and cooking. Our breakfast (*petit dejeuner* meaning literally "little breakfast") was the usual French coffee and hot milk and bread—nothing else. The *dejeuner* (literally "breakfast") was served at 1 p. m. and was quite like an American midday dinner without soup (there is no "luncheon" in France). Dinner was served at 7 p. m., a meal much like *dejeuner* in quantity, and with the addition of soup.

I advanced her the money for purchases, 200 francs at a time. She would take her basket each morning (including Sunday morning for food shops are all open on Sunday), and go to the shops or markets, bringing home whatever she liked, without consulting us. She aimed to surprise us at each meal, preparing each repast mysteriously. She had a book in which she kept a record of all her purchases and the prices. If she received a commission, privately, from each shopkeeper on everything she purchased, it was none of my business nor did I inquire about it. This commission belonged to her by right from time immemorial; the custom is established in France as firmly as the "squeeze" in China.

For all this service we paid her 100 francs a week (about $5.00), which high salary made her the envy of other French women engaged in a similar occupation.

We allowed her to retain a *femme de menage*—a woman who comes in to clean the rooms—twice a week, we paying this woman 10 francs to 13 francs for each day she came.

These wages seem low, compared with American wages, but it must be remembered that an unskilled laboring man in Paris at the time was getting $1.25 a day. Masons (builders) got $1.60 a day. Street car conductors earned $28.00 a month. I was told that the editor of one of the leading magazines got $80.00 a month. Clerks in banks got about $25.00 a month. Stenographers (women) got from $18.00 to $30.00 a month.

I have copied from Henriette's expense book the following list of *comestibles* with the prices we paid, expressed approximately in American money of the exchange current at the time:

| | |
|---|---|
| Beef (roast) | 50 cents per lb. |
| Beef consomme (boiling) | 32 cents per lb. |
| Beef steak | 40 cents per lb. |
| Mutton cutlet (chop) | 75 cents per lb. |
| Mutton (leg for roasting) | 50 cents per lb. |
| Mutton (for stewing) | 25 cents per lb. |
| Lamb (leg for roast) | 50 cents per lb. |
| Lamb (for stewing) | 30 cents per lb. |
| Veal (roast) | 55 cents per lb. |
| Veal (for stewing) | 30 cents per lb. |
| Veal brains | 40 cents per lb. |
| Pork (filet for roasting) | 60 cents per lb. |
| Bacon | 52 cents per lb. |
| Chickens (for roasting) | 50 cents per lb. |
| Pigeons | 50 cents apiece |
| Bread | 7½ cents per 1 lb. loaf |
| Butter | 50 cents per lb. |
| Eggs | 4 cents each |
| Tea | 95 cents per lb. |
| Coffee | 50 cents per lb. |
| Milk | 5 cents per quart |
| Potatoes | 7 cents per lb. |
| Leeks | 20 cents per bunch (about 3 lbs.) |
| Carrots and turnips | 7 cents per bunch |
| Peas | 20 cents per lb. |
| String beans | 30 cents per lb. |
| Mushrooms | 40 cents per lb. |
| Spinach | 5 cents per lb. |
| Cauliflower | 15 cents per medium head |
| Apples | 10 cents per lb. (three large apples) |
| Pears | 20 cents per lb. |
| Prunes | 25 cents per lb. |
| Apricots | 25 cents per lb. |
| Oranges | 2½ cents apiece. |
| Swiss cheese | 40 cents per lb. |
| Brie cheese | 35 cents per lb. |
| Roquefort cheese | 45 cents per lb. |
| Fish (Whiting) | 15 cents per lb. |
| Fish (Mackerel) | 15 cents per lb |
| Fish (Herring) | 10 cents per lb. |
| Fish (Sole) | 60 cents per lb. |
| Fish (Lobster) | 50 cents per lb. |

A semi-bituminous coal was used in the kitchen stove; it cost $1.00 per 200 lbs. English anthracite cost $2.10 per 200 lbs. In the fireplaces *boulets* were used—coal dust pressed into hard oval-shaped nuggets about twice the size of a hen's egg; they cost 85 cents per 200 lbs.

Our electric lighting bill averaged $4.00 a month. The gas averaged $2.50 a month.

After all, nobody can get the true flavor of life in Paris if he or she does not understand ordinary French conversation. From the very first day my wife spoke—I had almost said chattered—French with the housekeeper, and that, in itself, one might say, justified the adventure of keeping house in Paris.

## The Practice Babe

THEY are pioneering out in Oregon. The day of the covered wagon, the log cabin, the stockaded fort has passed, it is true, but the spirit of the West is still leading its men and women on to worthwhile achievements. One of the greatest of these is its development of an essential accomplishment—that of sensible motherhood—brought about through the education of its college girls at the state agricultural school.

The idea of the practice house is not new; one is maintained in connection with nearly every home economics department in colleges of any great size. There are, no doubt, many as interesting and as perfect in detail as that at the Oregon State Agricultural College, Corvallis, but this school is to be complimented for its leadership in an essential training given in connection with their practice house course. This training is for the proper care of babies, and is not done by books and charts and dolls, but by the actual guardianship of a real baby.

Miss Grace A. Johnson, professor of household administration at the college, is in charge of the practice house, and supervises the care of the baby. During their several weeks' stay at the house, each girl is given a week during which she is responsible for the proper care of the child, and, although Miss Johnson lives at the house, and oversees the schedules, the practice babe is, for seven days and nights, the absolute charge of his student nurse.

At different times, there have been six babies cared for by the students, for periods ranging from several months to the full school year. Miss Johnson told me that they had never had an unfortunate experience with their babies, nor have they had a contagious disease among them.

Master Rowen Whealdon, with his practice "mothers." Left—How the "practice baby" at O. A. C. looked at nine months, when he weighed nineteen pounds five ounces.

Rowen Robert Whealdon came to the practice house at the age of two months, weighing just seven pounds. He had been a premature baby, tipping the scales at six pounds, and up to the time he arrived at the college, had seemed to make but little progress in gaining either strength or flesh.

His progress was very gradual, but was constantly in the right direction. No trouble was experienced in keeping him on a good logical schedule, and it was not long before he was eating and acting as a normal baby should. When he was a year old, he weighed twenty-four pounds, which was four times his weight at birth. The following is the program used at that time:

6:00 a.m. 8 ounces whole milk.

8:30 a.m. Rises, orange juice, prune pulp or apple juice.

9:00 a.m. Bath.

10:00 a.m. Cereal, 8 ounces milk, bread crust.

1:00 p.m. Wakens from nap.

2:00 p.m. Vegetable, bread crust, 8 ounces of milk.

4:00 p.m. Ride—Afternoon nap.

6:00 p.m. Supper—cereal, 8 ounces milk, bread crust.

7:00 p.m. Bed for the night.

Only whole grain cereal, such as rolled oats or wheat-flakes are used, and he is having considerable variety in his vegetables, using spinach, carrots, tomatoes, et cetera.

# Golf—Can You Pick the Champions?

(*Concluded from page 13*)

There are many English sportsmen that are adopting the American viewpoint. They say:

"If the thing is worth doing at all it is worth doing well, at least as well as it is possible for us to do it. If we want to continue international competition then we should try to win at least our share of it. There is no sort of satisfaction to be derived from continued defeats and one of the surest ways of inviting defeat is to continue a policy of drift. Why not set out with our well-known determination to retrieve some of our lost athletic prestige?"

The United States has won four of the five Walker Cup matches played to date. She will probably win again this year. The United States seems unbeatable in golfing team play.

The same eight that try for the Walker Cup will go after the British amateur championship. That is something else again. While England cannot muster eight amateur golfers to compare with the eight that represent the United States, still in individual play there is nothing to assure security of a nature that team play offers. The best golfer does not always win a tournament. Luck is often more important than skill.

In the past the British amateur championship has always been a next to impossible goal for Americans. Only one man, Walter J. Travis, was ever able to win the title for the United States. He did this at Sandwich in 1904. Robert Gardner came near turning the trick at Muirfield in 1920 but on the 37th hole of the final match the old hoodoo again asserted itself and he lost to Cyril Tolley. But, as already remarked, never before have so many good American golfers been present in British tournament play and Britain has had better representatives in the field than this year.

After our amateurs complete their challenge in Great Britain the professionals will start and America expects to have more than a dozen of her best in competition. Here again the United States will be represented by more good golfing talent than any other country, and will therefore have a decided edge.

No one denies that golf has gone back in Great Britain. America has better golfers, both amateur and professional, than can be found on the other side. But for this Yankee supremacy we have to thank Great Britain and not credit ourselves. Great Britain made it possible by supplying the United States with the bulk of instructors and these, Great Britain's sons, developed the golfing stars that the United States boasts today, the same stars that have lowered England's golfing pride.

England has lost golfer after golfer to the United States. Early this year Archie Compston, professional champion of England, came to the United States for an exhibition tour. Six weeks later he cabled back to England that he had accepted a position as pro with a New York golf club.

Most of the good British pros succumbed to American offers in the past. Only a few of her stars were able to refuse the big inducements held out on this side and in the list of those that remained in Great Britain are found such men as Edward Ray, Harry Vardon, Abe Mitchell, James Braid, and George Duncan.

In the last six years the United States open championship has been won by four golfers that were born and trained in the game in the British Isles, namely: Edward Ray, James Barnes, Cyril Walker and Willie Macfarlane. Ray is the only one that has not long been settled in this country.

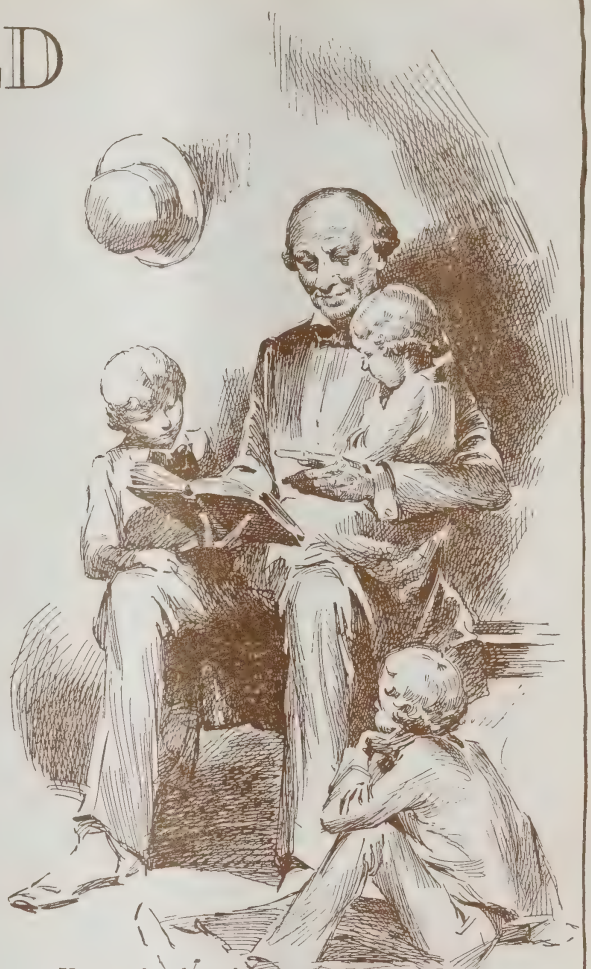
While four British-born golfers were able to win the United States open in six years it is a paradox that Walter Hagen, American-born, was not able to win it but that during the six years this same Hagen twice won the British open championship and finished runner-up in another year. Barnes, who won the British open last year, is British-born, although he resides in the United States.

There is this about the controversy in regard to golfing supremacy: Hagen, admittedly the best of professional golfers, and Jones, probably the best golfer of any class, are both American-born. To this the Englishman will reply: "Yes, but they were taught by British professionals."

And there, as they say, you are.

# The Jolly Old Pedagogue

*from George Arnold —*
*in McGuffey's Sixth Eclectic Reader.*



'Twas a jolly old pedagogue, long ago,
Tall, and slender, and sallow, and dry;
His form was bent, and his gait was slow,
And his long, thin hair was white as snow,
But a wonderful twinkle shone in his eye:
And he sang every night as he went to bed,
"Let us be happy down here below;
The living should live, though the dead be dead,"
Said the jolly old pedagogue, long ago.

He lived in the house by the hawthorn lane,
With roses and woodbine over the door;
His rooms were quiet, and neat, and plain,
But a spirit of comfort there held reign,
And made him forget he was old and poor.
"I need so little," he often said;
"And my friends and relatives here below
Won't litigate over me when I am dead,"
Said the jolly old pedagogue, long ago.

With the stupidest boys, he was kind and cool,
Speaking only in gentlest tones;
The rod was scarcely known in his school,
Whipping to him was a barbarous rule,
And too hard work for his poor old bones;
Besides it was painful, he sometimes said:
"We should make life pleasant down here below-
The living need charity more than the dead,"
Said the jolly old pedagogue, long ago.

He taught the scholars the Rule of Three,
Reading, and writing, and history too;
He took the little ones on his knee,
For a kind old heart in his breast had he,
And the wants of the littlest child he knew.
"Learn while you're young," he often said,
"There is much to enjoy down here below;
Life for the living, and rest for the dead!"
Said the jolly old pedagogue, long ago.

He sat at his door one midsummer night,
After the sun had sunk in the west,
And the lingering beams of golden light
Made his kindly old face look warm and bright,
While the odorous night winds whispered, "Rest!"
Gently, gently, he bowed his head;
There were angels waiting for him, I know;
He was sure of his happiness, living or dead,
This jolly old pedagogue, long ago!

THE LIBRARY OF THE
UNIV. OF ILLINOIS
URBANA ILL

THE most sweet and tender, the most innocent and encouraging society may be found in any natural object, even for the poor misanthrope and most melancholy man. There can be no very black melancholy to him who lives in the midst of Nature and has his senses still. There was never yet such a storm but it was Aeolian music to a healthy and innocent ear. Nothing can rightly compel a simple and brave man to a vulgar sadness. While I enjoy the friendship of the seasons, I trust that nothing can make life a burden to me.

Henry D. Thoreau

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week discusses that imaginative thing known as the "saturation point."

Relatives have relatives! Advocates of the Perlman bill, which would throw open the gates of this country to the relatives of immigrants regardless of quota restrictions, insist that it would admit only a very few. But—*these relatives have relatives of their own, who in turn would be eligible for admission!* Remember that fact—and others contained in this article—next time you encounter pro-alien propaganda. (p. 3)

From aliens let's turn to Americans. The story of America can be traced in its cities: in Boston, where Bunker Hill stands as a monument to the forefathers; in Philadelphia, with its quaint Quaker traditions; in Richmond—where you will still find the heart of the Old South. A charming tale of a charming city. (p. 2)

And while we are considering aliens and Americans, compare the licentious plays imported for the delectation of New York's foreign-born, with the home-talent ones produced in "opery houses" and village halls a generation ago. Perhaps it was not great art, but surely it was rare entertainment. This story will bring back memories to you. (p. 8)

If you want to steal apples, don't take rotten ones from the ground. *That's a felony.* Take nice ripe ones from the tree. *That's only a misdemeanor;* and neither the farmer nor the policeman can arrest you without first procuring a warrant. This illustrates some of the peculiarities of our laws. Professor Waite of the University of Michigan reveals the stupidity of the statutes governing trespass. (p. 24)

Friends may die, or move to distant parts, but good books are constant companions. And no work can so fill a man's life that he cannot find time for some outside interest. A college education does not insure success; but it does provide a basis for culture—which the student himself must carry on. Allan Benson makes some interesting observations. (p. 16)

PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer;
C. B. Longley, Secretary; W. J. Cameron, Editor.

"And you, beloved, are a nut." Thus sang Anna Knish, and the intelligentsia hailed the words as the dawn of new and beautiful poetry. But night came instanter. The author disclosed that the poems, far from possessing a mystical, hidden meaning, actually comprised a ribald hoax on the pseudo-literary. The article is the first of three by Charles J. Finger. (p. 12)

Keep sane. We've often heard that admonition; but how should we go about it? The world today lives under peculiar conditions. In many ways they are the most favorable ever known, but in some respects they are dangerous. We all work under pressure, but we need not break under the strain. Dr. Laird tells us how and why. (p. 5)

There is a name known to every American child—Paul Revere, whose famed ride to warn "every Middlesex village and farm" is classic in the annals of the Republic. Most of us learned the story of the ride from Longfellow's poem. Here is Paul Revere's own account of it in his own words. (p. 19)

A strong, white light seems to be shining upon the Administration. Reports from two ambassadors are not only illuminating—but devastating to the hopes of those who would embroil this nation in the great European muddle. President Coolidge now has the facts; the question is: what will he do? The editorial—"A Sudden Squall"—will interest you. (p. 10)

When did man first appear on earth? No one knows. One guess probably is as good as the next. Discoveries are made. Theories are formed. And then everything is toppled over by new discoveries. In an Arizona cañon is a pictograph of a dinosaur. Scientists believe that dinosaurs vanished before the first man came, yet this was drawn by human hands. Who put it there? (p. 14)

Are you planning to set out new trees in your yard this year? Read this article about a type of elm recently evolved. You will find in it valuable advice, which may aid you in making your selections. (p. 31)

When Woodrow Wilson was convinced that a thing was right, he battled for it with all his strength, regardless of consequences. Here is an interesting side light on how he came to enter politics—because of a sacrifice to an ideal at Princeton. "They kicked me out," he said; but they really kicked him into the Presidency. (p. 7)

Resentment is voiced by many laundrymen at the "Office Chat" in our March 6 issue, wherein *The Man from New York* decried the destructive tendencies of modern laundries. Some even intimated the interview was fictitious. The fact is that the caller was so prominent that were his name mentioned it would be readily recognized on two continents. The public in every part of the country is complaining about the way clothing is affected by the cleansing process. If the laundry business would heed these plaints instead of resenting them, it would do itself real service.

SUBSCRIPTION PRICE $1.50 A YEAR in the United States and its dependencies, also Canada, Cuba, Mexico and countries where the United States Domestic Postage Rate applies; other foreign countries, $2.00 a year. Single copy, five cents.

CHANGE OF ADDRESS. 1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

## Not Quite So Lively as of Yore, But Its Rare Old Traditions Are Still Undimmed

DRAWINGS BY PAUL FRANKLIN SEAVEY

By MAY B. WHITING

Above—The Old Stone House—now a Poe shrine.

Below—The White House of the Confederacy.

RICHMOND, like Rome, is built on seven hills. In true classic style its capitol crowns one of them, and from all sides the streets come climbing sedately up to it. And what pageantry they have witnessed, the streets of Richmond! First they were only red clay gullies with Colonel William Byrd II, the "Black Swan of Virginia," riding gaily through them, building, as he says, "not castles only, but cities in the air." Then there were long trains of pack horses laden with furs coming down from the hills, and canvas-covered wagons moored near the market and tavern, like ships about a wharf.

After nearly fifty years comes Benedict Arnold and his Queen's Rangers, harrying the town and pouring wine into the streets so that men and hogs walk strangely in the mire. Then Lafayette to the rescue, himself retreating before Cornwallis and making a road into the wilderness known today as the "Marquis's Road." But how gay the city was that Christmas with news of the surrender at Yorktown! There were candles in the windows and fireworks in the streets as there are today at Christmas time, and a Peace Ball with the queen chosen by lot, so that a shoemaker's daughter led off the dance, followed by ladies in taffeta and gentlemen in silken "smallclothes" and bag wigs.

There were bits of sinister pageantry, too, amid the gayer. Once there rode through the streets three mysterious figures in purple coats and hoods, a rope around their necks, and each one seated on a narrow box that was to be his coffin. They were Spanish pirates riding to the gallows, and on the hills of Richmond a goodly throng enjoyed the spectacle. In the sad sixties the flower of the South, the Confederate Army, marched proudly through the streets amid the rebel yell, "ahwee." Then a besieged Richmond, the entrance of the Federals amid blazing warehouses and homes, a broken city that would need years of slow rebuilding.

And all that colorful life centered about the square and the capitol, designed by Jefferson, who, while abroad, fell in love with Grecian architecture. He sent over the French sculptor, Houdon, who worked at Mount Vernon, modeling from life the statue of Washington that adorns the rotunda. In the grounds is another statue of the general seated on his horse and surrounded by six of his friends. Some of these history has almost forgotten, as Thomas Nelson, Governor of Virginia, who, when the Continental Congress was bankrupt, raised $2,000,000 on his own estate for the army, and never received a penny in recompense. At Yorktown he trained the cannon on his own home and demolished it because it was thought to be the headquarters of Cornwallis.

In 1807 Aaron Burr, one time Vice-President of the United States, was tried for treason in the capitol at Richmond. Chief Justice Marshall, who presided, was thought to have a leaning toward the prisoner, while President Jefferson detested him. Day after day Burr appeared, beautifully attired in black silk, his hair powdered and brushed back from a countenance pale and immobile, except for dark, burning eyes. With him was his beloved daughter, Theodosia. When out on bail, the prisoners were entertained in many Richmond homes, Chief Justice Marshall so far forgetting his dignity at one time as to dine with them. After nearly three months the jury found Burr not guilty according to the evidence before them. His counsel strove for a verdict of simply "not guilty," but they refused and Burr was sent back to Ohio for a trial which never came up.

In St. John's, a little white church on one of Richmond's hills, an earlier and more momentous drama was enacted. In order to get away from Lord Dunmore, who was governor in Williamsburg, the convention of patriots assembled in the town by the falls of James River. Washington was there, and Jefferson, and Patrick Henry, who sat in a pew by the east door, now marked by a bronze plate. Early in the convention he shocked the more conservative by proposing that Virginia raise an armed force. For three days the motion was debated, then, "with unearthly fire burning in his eye," he arose and made the famous speech, closing with, "I know not what course others may take, but as for me, give me liberty or give me death."

"Infamously

(Concluded on page 30)

# Letting in the Alien Flood—Why?

## Relatives Have Relatives—and the Perlman Bill Would Admit Them All

By KENNETH WATSON

AN "ENDLESS CHAIN" of aliens, or "relatives," increasing immeasurably each year would be admitted to this country regardless of quota restrictions if the Perlman bill—sponsored by Representative Nathan Perlman, native of the ghetto, vigorously advocated by the American Jewish Congress and allied organizations—should be passed by Congress!

Its effect would be to nullify the immigration law of 1924, which limits the number of aliens admissible in any one year. Contrary to the assertion of supporters of the measure that it would mean an annual additional entry of only 40,000 to 50,000, opponents have demonstrated that 622,000 could swarm to America immediately; and that this number would eventually *increase* rather than *decrease*.

Under the present law *citizens* may bring in their wives, and children under 18 years of age, *outside of quota provisions*. The Perlman bill would not only extend this privilege to the fathers and mothers of citizens and increase the age limit of children to 21 years, but it would grant it to *alien residents* who declared their intention of becoming citizens prior to July 1, 1924.

This means that as soon as aliens now coming in become naturalized, they in turn could bring in their fathers, mothers, wives and children *outside of quota regulations*—an incalculable swarm! This was forcibly demonstrated in the testimony before the House Immigration Committee of Coert du Bois, chief of the visé division of the State Department.

Du Bois showed that if the Perlman bill is passed that Poland alone will furnish as many aliens as supporters of the measure claim would come into the United States from all Europe. He said:

"I made something of a study of Poland to see what would happen. The present Polish quota is 5,982, with a demand against it of 75,000, as we know. Now, under the Perlman bill the 3,000 preference relatives would be non-quota and would come forward at once. In addition, there would come forward at once about 33,500 relatives of aliens, making a total of 36,500 Polish-born persons that would come into the country immediately or as soon as the visés could be ground out. In the year 1926-27, you would still have the quota of 5,982. Under the preference provision of the Perlman bill the entire number would be relatives of aliens, so we would have 5,982 relatives of aliens coming in under the quota, or a total of 42,048 of Polish birth."

"All the 42,000 upon arrival in the United States would be entitled to the certain privileges for *their* relatives still in Poland under the Perlman bill," Du Bois stated. (Relatives all have relatives, too).

"In other words, the 42,000 would be the beginning of an endless chain?" Representative Bacon asked.

"Yes, sir," Du Bois replied.

"It would accumulate like a snowball rolling down the hill?" again queried Bacon. "Yes, sir."

Another weak link in the arguments advanced by interests trying to batter down the present restrictive law is that their charges that Congress is acting as a "divorce court" and separating families of aliens is unjustified. This was asserted most strenuously by Rabbi Stephen S. Wise in his testimony before the committee.

"*As a matter of fact, members of aliens' families are not absolutely barred today. They are simply deterred by the quota restriction. Some are entering every day. Some will reach here next month; some next year.*" Representative Albert Johnson, of Washington, chair-

man of the committee declared recently on the House floor.

Johnson then proceeded to show that there is nothing in our law which prevents an alien from uniting his family in some other country.

*"If an alien wants to unite with his family, there is nothing to prevent such union in the country from which he came. No alien comes here except by his own initiative. Our government does not separate any alien from his family,"* he said.

He pointed out that the initial arrival of an alien in the United States and his first separation from his family is purely voluntary and in most cases with a full knowledge on his part of the difficulties he may face later in getting them into the country.

"It follows that we are under no obligation to conform our governmental policies to his desires or alter our statutes to suit his conveniences," Johnson declared.

This point was illustrated in a simple, but strikingly forceful manner by Representative William P. Holaday, of Illinois, another member of the Immigration Committee.

"Suppose during a big league baseball game a man arrives with his wife and is informed by the ticket seller that there is just one more seat unsold. Under this circumstance the man either has the option of departing with his wife, allowing her to see the game alone, or going in himself. If he decides on the latter and then the minute he gets inside the gate sets up a complaint that the ball park is separating himself from his wife, whose fault is it? That's exactly the situation that is presented in many of the most strenuous complaints now being made that our laws are inhuman," Holaday informed the writer.

When Rabbi Wise appeared before the committee recently he advanced the claim that the Perlman bill would not be opposed by organized labor.

"The thing that interests me," he said, "is that at this time, there is no opposition, in truth, there can be no hostility, explicit or implicit, upon the part of the forces of organized labor in America. There can be no hostility because the proposed amendments to the bill, after all involve no possibility of the introduction of any competitive industrial force in the American life, and, without having the right to speak for labor, I think you will find upon investigation, that organized labor will not lift its voice, in truth, morally, it cannot, against the provision."

A few days later the Rabbi's testimony was contradicted most emphatically by Edgar Wallace, who appeared before the committee to speak for the American Federation of Labor. Although Wallace's purpose before the committee was to discuss another phase of the immigration problems, the Mexican situation, he also took occasion to voice vigorous opposition to the Perlman bill.

One of the interesting recent developments in the discussion on the Perlman bill has been the position taken by Representative Meyer Jacobstein, of Rochester, New York, himself author of a bill to modify the existing law. Although his own measure is far less extensive than the Perlman bill, Jacobstein startled the Jewish lobbyists by declaring that he had come to the conclusion that even his bill would be too drastic in its application.

These are some of the relatives. And they have still more relatives. And all the other relatives have relatives. Relationship is an endless chain. The United States did not separate this family from its head. He came, knowing the law. His family can come, too, in their quota turn. To charge the quota law with separating families who knowingly separate themselves is to slander the humanity of the United States. Challenge that false propaganda wherever you meet it.

"Suppose that Mr. Sabath, Mr. Dickstein and Mr. Perlman (all authors of immigration-tampering proposals) could show that the number that would come in under their bills would be very small," he declared. "There would be no argument—you probably would let them in. So I immediately began to make an investigation of the facts, regardless of where the facts were going to lead me. Gentlemen: I will say very frankly that the facts ran counter to one part of my own bill. I am frank to admit that if I had had all the facts before me when I introduced the bill, I would have altered my bill a little bit."

The dangers of the bill sponsored by beet sugar interests for allowing Mexican peons to enter, virtually without restriction, were emphasized by Mr. Wallace of the American Federation of Labor in his testimony before the committee.

"I do not think we can afford to have a sort of contract-labor, a sort of peon labor in this country," he declared.

Wallace predicted that as soon as the beet sugar interests learn they cannot continue to obtain huge numbers of Mexican peons, that they will perfect mechanical methods for lessening the labor obligation required in beet production.

"They will find a method. I do not see any reason why there should not be some method of cultivating sugar beets, except to have little children crawling on their stomachs. In this migration that is asked for here the main desire is to get the wife and the little children. You can tell me that these children go to school, but I have seen them on their stomachs in the beet fields, picking weeds or thinning out," Wallace testified.

Far larger than the economic problem involved in continued introduction of hordes of Mexican peons into the United States, looms the social problem that such a situation presents. For it is well established that the Mexican race does not easily assimilate with our nationalities, and even some of the strongest proponents of the attempts to modify the Mexican restrictions admit the enormity of this problem.

When other witnesses attempted to minimize the problem and stated that a few thousand Mexican laborers could not possibly affect the United States, Representative Johnson showed the ignorance of their positions.

"This committee knows from its studies that the largest number of black people ever brought in during any one year was less than 8,000. Who would have thought at that time that a great race problem would have come, leading to a great war, from the introduction of those few blacks?" Johnson said.

He predicted that one of the imminent dangers, unless Congress legislates most wisely on all immigration problems, is the development of *a peasant type of agricultural laborer.*

"I will add to what I have said that I am in mortal fear that the United States will come all too soon to tenant farming and a peasantry of its own. I see that coming on, and as I think of it I realize that the nation, because it is a new country with an enormous population, cannot hope to escape the farm situations of the older countries."

# Two Dozen Ways to Keep Sane

## Not Heredity, But Ways of Thinking and Living Cause Mental Breakdowns

A FEW days ago a student came to me, glanced around the laboratory, and asked if anyone could hear us.

"Doc, I'm worried. A cousin of mine, school-teacher at Evanston, has been acting funny for some time. Saw her last summer and was struck by her queerness.

"Now," he continued with effort, "they've had to take her to a private sanitarium and they don't know if she will recover. For a while she is very happy and excited, then she gradually becomes glum and gloomy and will sit around weeping for a week."

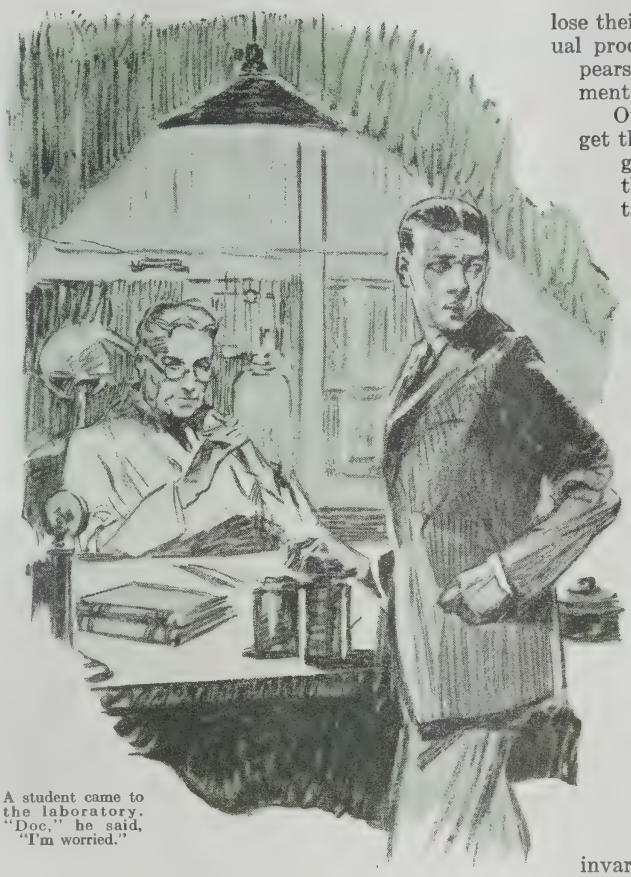
It appeared to be a case of what is known as manic-depressive mental disorder.

"About one-fourth of people who have mental disorder recover," I said laconically, trying to encourage him.

"But think of the family, even if she is one of the fortunate fourth," he countered.

"You mean—"

"If this thing is in the family any of us might have a breakdown like that."



He voiced a very common opinion, one that causes much mental anguish, and one for which there is but scant, if any, foundation.

From the bookshelf just back of my chair I took Dr. Myerson's new book on the inheritance of mental diseases. I told the student how Dr. Myerson had found little basis for the belief that mental disorder was inherited. It may run in families, but for reasons other than "bad blood."

"Your cousin who is mentally ill may have a bad effect on the family," I said, "if the family worries about heredity. It is the worry, not the heredity that is bad.

"Feeble-mindedness does run in families. But your cousin was not feeble-minded for she was a school-teacher. You are not feeble-minded because you read magazines and newspapers readily.

"There is nothing especially unusual about your cousin," I continued. "Last year there were almost as many persons admitted to mental hospitals as there are in the Silver State of Nevada; more than there are in the great steel city of Gary.

A student came to the laboratory. "Doc," he said, "I'm worried."

By DONALD A. LAIRD, Ph.D.

ILLUSTRATED BY J. C. GRAHAM

"It is not heredity, but ways of thinking and ways of living that caused most of these mental breakdowns. Your cousin probably was not bothered by her way of living."

He nodded assent.

"In her ways of thinking?"

"She always was prudish, but that was her parents' fault. They would not let her go with fellows when she was in college and had her upset most of the time about the sins of the world," he said. "They let her have no close friends. If she was not home from her teaching by four o'clock her mother went after her. Her mother went with her whenever she had to be out evenings."

"Now does that sound like bad heredity or a foolish mother?" I asked.

"I think I'd go off the handle myself if I had to live like that," was his reply.

And I agreed with him inwardly.

This girl of 28 had not suddenly "lost her mind." For years she had been slipping. People do not suddenly lose their mental control. It is a gradual process and in many cases it appears possible to check the development before it has gone too far.

One is not born that way, they get that way. There are two dozen good rules to prevent getting that way which I use in my mental hygiene work with students, a surprising number of whom seem to be well along toward getting that way.

These rules are:

1. Avoid alcohol to any excess. About 5 per cent of mental disorder is due directly to alcoholic excesses. Women are not afflicted with alcoholic psychoses—as breakdowns due to this cause are called—as frequently as are men, but they do occur with regretful commonness among women who appear to be as susceptible to the disastrous influences as are men.

2. Avoid social disease. One out of every ten mental patients is taken to wards with paresis, which is caused solely by social disease. Five years ago this form of mental disorder was considered incurable, and after a few years with the disorder death invariably followed. Advance in treatment during the last few years, however, is bringing about wonderful cures.

Not all mental disorders can be so remarkably relieved, however. The ounce of prevention by right thinking and right living still beats a ton of cure in most cases.

3. Keep physically fit. At the Trenton, New Jersey, State Hospital Dr. Cotton is bringing about what appear to be phenomenal recoveries by removing points of infection in the body. A good rule is to have a complete medical examination on every birthday, including X-ray examination for hidden infections. Exercise of a vigorous kind out in the open should be taken every day. If you were to visit a mental hospital you would find the patients taken outdoors for a walk two hours each forenoon and again two hours each afternoon. At the Chicago State Hospital you would find a gymnasium instructor prescribing exercises for patients.

4. Avoid hunting for reasons to justify everything you do. Most of the activities of daily life are so unimportant that it does not matter whether you wear this necktie or that one. Still there are many people who spend a

Have hobbies which do something, not merely think something.

long time deciding which tie to wear, which thing to do first, whether to start a letter "Dear Sirs" or "Gentlemen."

Accept your decisions without quibbling, and do not bore others or handicap yourself by continually explaining just *why* you did just *what* you did.

5. Mingle freely with others. Do not be socially backward. Do not be a recluse who lives in a world of fancy rather than in the world of reality. Avoid even a tendency in this direction. Take in some social gathering at least once a week. Drop in some evening and visit neighbors. Be a social being and you'll be a healthier person mentally.

6. Do not be afraid to express your emotions. Let your feelings of joy, admiration, dislike, and enthusiasm be known. If you do not feel these, you'll be surprised to find how soon they can be acquired if you merely pretend a little admiration and enthusiasm. Is there some national figure for whom you show admiration? Some civic activity in your community about which you are enthusiastic? By all means find some if you do not have them now.

7. Keep your stronger emotions under control. Anger, hatred, and sex cannot be entirely crowded out of one's mental life, but they should be guided as a spirited horse. You do not try to keep the horse motionless, but rather to guide him with a tight rein. So with these more spirited emotions. Accept these emotions as natural, but always try to control and guide them.

8. Recognize that work under pressure and hurry is not necessary in modern life. Have you really tried to be easy-going for an hour or two each day?

9. Learn how to relax and rest, both mentally and physically. The farmer's horse relaxes during the work whenever his master releases the reins. Many moderns do not have this horse sense.

10. Do not work by fits and starts. Do not alternate extreme work with rest. Work steadily and consistently, and work becomes easier.

11. Play as well as work. But keep the two separate. Do you know how to enjoy a concert, outdoor exercise, reading, the theater? Each day you should have several hours' diversion of one of these, diversion different from the work of the day.

12. Realize that you are not an exception. Others have the same trials, the same human weaknesses, the same failures. You are not the most unlucky person, your problems are not different from anyone else's. This does not imply to give up, but rather to recognize that after all there is nothing unusual about it, or about yourself for that matter.

13. Have some close friends. Marriage seems to be the only way some can gain a close friend, and from this does marriage win the special support of the mental hygienist. Friendship, however, requires both give and take; it demands personal sacrifices at times.

14. Talk over your troubles. You have many little irritations which do not merit the dignity of "trouble." But when troubles arise take them to your friend, your family, or your priest and talk them over. Don't try to forget them, don't shirk them, don't spend useless worry over them: talk them over with someone.

15. Avoid keeping things to yourself. The secretive person gets nowhere, and his secretiveness may help get him into the mental hospital.

16. The gossip who tells all he knows—and some that he does not know—is as harmful to himself as his opposite, the secretive person. There is a balance which we can all achieve.

17. Do nothing which you may later regret and worry over. The easiest way to choke off worry is at its source.

18. Don't be a prude. And at the same time do not be a rake. Acknowledge the biological necessity and imperativeness of sex.

19. Don't have a hypersensitive conscience. Do not make a moral mountain out of the molehills of everyday conduct. Be moral, think morally, but don't make a moral issue out of everything.

20. Be considerate of the feelings of others. Outspokenness, a tendency to belittle others, to slur them is a close relative of the mental patient.

21. Do not be suspicious of the motives and morals of others. The school-teacher with whom we started this article failed in this, but she had been raised that way by her parents. Others are not trying to get the best of you and are not moral degenerates.

22. Set a reasonable goal for your ambition—one that it is possible to attain. Forget the mansion and servants; set your goal on a six-room bungalow, a cheap car, a steady job, the respect of others. You can find happiness and success where you are and in simple things.

23. Have some hobbies—flowers, poultry, fishing, saving, helping. Have hobbies in which you *do* something, not merely *think* something.

24. Forget your heredity. One person is responsible for you—you.

Keep physically fit. Exercise in the open every day.

# Woodrow Wilson—Taker of Chances

## Was Always Willing to Risk All He Possessed in a Single Throw

PART IV.

By HUSTON THOMPSON

President and Mrs. Wilson on their way to Carnegie Hall, New York City, where the President delivered his first public address after the signing of the Peace Treaty.

AS I SUGGESTED in a previous article, Woodrow Wilson was a supreme taker of chances. The well-known and universally respected American trait of good sportsmanship found its exemplification in him. He loved to "take a chance" in putting his cause to the acid test.

To one who studied the outward expression of the inner workings of Woodrow Wilson's mentality it is hard to believe that Rudyard Kipling could have had anybody else in mind when he wrote his great poem, *If*, which was to Mr. Wilson more than a favorite composition in English literature—a chart which he often said, before and after he became President, he tried to follow. When he took up his residence at the White House he had a copy of *If* framed and hung upon the wall.

Time and again Mr. Wilson "made one heap of all his winnings" and risked them on "one turn of pitch and toss." He seemed to reach a stage of spiritual exaltation when he thus threw his cause into the balance, with the chance of defeat sometimes apparently greater than the chance of victory. To his cautious, crafty political advisers—a type that believes in "playing safe"—his bold gamble to stand or fall on "one turn" invariably caused a feeling akin to prostration.

One of his first dramatic gambles occurred when he was president of Princeton. An alumnus offered $500,000 to the university, with the condition that $500,000 more be subscribed to put with it. Half a million could, of course, easily be raised for Princeton at any time, so the gift was practically a million dollars. However, certain stipulations were attached as to how the money should be used. Mr. Wilson disapproved of them.

The bequest was to go to the building of a graduate college. One of the conditions was that this college should be located some distance from the university campus. For a long time President Wilson had sought to bring the university life closer to the campus. He feared that the conditions of the bequest would, among other things, cut off the graduate students from the undergraduates, and make for exclusiveness just as the location of the social clubs some distance from the campus had so affected undergraduate life.

About this time Woodrow Wilson delivered an address on Abraham Lincoln in Chicago, and upon his return to Princeton, he gave an informal talk on the subject: "Would a college education have helped Lincoln?" Apropos of his address, Mr. Wilson was engaged upon a program of trying to make the life and work of one of our oldest eastern institutions fit young men for a career of service in a democracy, and, as he put it, not merely provide a country club for the acquirement of a decorative culture. "Princeton for the Nation's Service" was his slogan, and opposed to him was the opinion of those who would have higher learning a kind of "Art for Art's sake."

Four years in our modern college, said he, would have given Lincoln no additional chances of being of service to his country, but four years under such a social system as existed in them would have been a most serious handicap to him.

"For," said Mr. Wilson, "Lincoln's strength lay in his close kinship with the understanding and desires of the common people, those who were in the everyday struggle. It was because he never lost touch with them that he was able to solidify the North and lead it to victory through four years of a civil war.

"The social life of our colleges today, through its fraternities and clubs, encourages young people to become acutely critical and discriminatory of those with whom they associate, and to select as companions only

Delegation at Governor Wilson's summer home notifying him of his nomination for the Presidency of the United States on the Democratic ticket.

# The Drama of Our Youth

## Village Theatricals When Father and Mother Were Characters in the Play

By CAROLINE ELIZA VOSE

VILLAGE theatricals—oh, what fun they were! They were common to sections of the United States so that many of us treasure them as an exciting, happy part of our country-spent youth.

No play put on by any skilled theatrical producer, however famous or artistic, can ever cause the same thrill or stir the emotions I experienced at witnessing the plays given in our village hall when I was a child.

They were truly community affairs, entered into by young and old, with everyone feeling a certain responsibility for their success. Antedating motion pictures, the radio, and automobiling, they were among the few important social events of the year.

Did the wooden sidewalks require extension or repairs, was there need of grading and fence mending at the cemetery, did the school lack globes, or the hall need shingling—then give a play to raise the money, of course. Yes, give a play.

I can feel it yet—the excitement in the air when I would first hear about the proposed drama. Nearly everyone called it a drama, only many people pronounced it *drayma*.

I always listened eagerly whenever the grown-ups discussed the entertainment.

"Mamie Cole's doing awfully well. I'm glad she's got a part this year," father would say.

"Yes, and Foster Hamilton's good, too, as the hero," Sister Sue would chime in.

"How's Jo Bendix doing, Will?" mother would ask.

"Jo? Jo is fine. Truly that man ought to go on the stage, and Bertha Cleaves is the funniest thing as the old gypsy woman. You'll die laughing when you see her."

I hoped nobody would die laughing, but I could hardly wait to see Jennie Cleaves' mother as an old gypsy woman. I never had seen one in real life.

My delight was unbounded whenever members of my family were in the cast. How I lorded it over my less fortunate companions!

"My father's going to be in the drama, and he's got a big part, too," I would proudly inform Sybil Bruce. Before Sybil could recover from this crushing blow, I would cruelly deliver another. "Sue's going to be in it. I think she's the heroine." The last word was pronounced somewhat gingerly.

"Tommy! Tommy Pike, did you know my father'n sister are both'n the drama?"

With the children whose relatives were also for the time being actors I developed a close intimacy. I found a great deal to discuss with them. The principals themselves were not more ardent than was this younger group shining in reflected glory.

The rehearsals, except the last two or three, were held at the homes of different people in the cast. Once in a while—joyful occasion—a rehearsal was held at our house. Mother always let me stay up for part of it if I promised to be absolutely quiet. I was quiet, so quiet usually that she forgot I was there till it was all over. Extra lamps were lighted, no electric lights in the country in those days. Even the best parlor one was brought out into the sitting room. The furniture was all changed around until I felt as though I were in a strange room.

It was more or less a point of honor for every member of the cast to attend all rehearsals. The men may have had a long strenuous day hauling wood, cutting ice, ploughing, or getting in crops, but dressed in their "store clothes" they turned out for a rehearsal just the same. There was much laughing and talking at first followed by the rehearsal itself. There was no regular coach but everyone made suggestions. Afterward no matter how late it was mother always served something to eat: cake or cookies with perhaps cornballs and homemade candy, and not infrequently hot coffee and doughnuts.

The costumes were indeed a community affair. Everybody in the neighborhood hunted about in closet and attic for suitable garments for the actors, and everybody was willing to lend. Old dresses were made over, and new ones were fashioned out of cambric, cheesecloth, and other inexpensive materials. I used to watch with wonder the marvelous transformations into wearing apparel wrought with ordinary strips of cloth and with the heterogeneous contents of rag-bags.

Finally the longed-for evening would arrive and I would clutch my fifteen cents in my hot little hand, for I always wanted the fun of paying for myself. I felt important handing my money to the ticket-taker at the door. It might be Mr. Tracy, the postmaster, or Sybil Bruce's

# MR. FORD'S PAGE

AMONG the imaginative exercises of the human mind is the creation of that mysterious verbal quantity known as the "saturation point." It is much discussed, but so far as known an actual exhibit of such a "point" has not been made. If someone would actually produce, in history or contemporary experience, a true illustration of the "saturation point," it would be a matter of great interest.

To take a matter near at hand, where is the "saturation point" in transportation? Time was when a few favored people owned oxen. Just when the "saturation point" in oxen was reached, if ever it was, is not known. But it was succeeded by a time when more people owned horses then ever owned oxen. The horse had his day, yet we do not remember ever having heard that the "saturation point" was ever reached with reference to him. But the horse was succeeded by the bicycle, and more people owned and rode bicycles than ever owned or drove horses. Looking back upon those days no memory arises of any discussion about the "saturation point" in bicycles, yet gradually the automobile came upon the scene and more people drive automobiles than ever rode bicycles.

The point of these facts is that the "saturation point" of the service which we call transportation has never been reached, that each new means of transportation has had wider use than any of its predecessors, and that even with all this only a small portion of the world's population is served by transportation facilities.

This subject has been discussed so exclusively from the salesman's point of view that we are inclined to neglect its larger implications. The first thing to do, obviously, would be to gather a few "saturation points" together for study. But the "points" are missing. They are yet to be produced. We discover that we are talking about something that has never existed, and that probably cannot exist except in fear or unfaith in the future.

Saturation points, it would seem, have the habit of turning into something else the closer you approach them. When the pulling power of locomotives was "saturated" with heavier loads, the result was larger locomotives, larger cars, larger loads. The "point" was not an end, but a beginning.

Where is the "saturation point" in education? Just as it had been reached in Europe—that is, when all the gentlemen's sons had been educated—someone discovered that the plain people were competent to receive instruction also, and education has never yet caught up with the large order which that involved.

There is no "saturation point" for any service, but there probably is such a "point" for some methods. In salesmanship, for example, the time comes when all the people who are natural self-starters, that is, the people who *sell themselves* what they want, are fully supplied with your commodity. They are limited in number and are finally filled up. That is the "saturation point" of the lazy or resourceless salesman. He must wait for these self-starters among the people to use up what they have bought and come again.

*ONE of the mirages of the mind is the quantity called the "saturation point." Such a point does not exist in any service. Society readily gets too much of a bad, destructive or negative thing, but not of a good, constructive and positive thing. In business lines, whole sections of the United States are still virgin fields. If this is so of our country, what must be true of the world! As to people who are self-starters, who buy voluntarily, there is indeed a saturation point for the lazy or resourceless business man. But such self-buyers are few; a world of less ready-minded people await the cultivation of their faculty of use.*

But another type of salesman uses this "point" as a door beckoning him into the wider field of those who must be sold, who must be shown their need of the service you have to give and persuaded of your ability to give it. And this class grades away into various "saturation points," as the more-ready and less ready-minded are reached.

People who talk about the "saturation point" in automobiles today have in mind the people who have owned cars, or readily incline to own cars; they forget the tens of millions in the United States alone who have never owned cars, yet have use for cars, and need to be labored with in order to bring them abreast of their own times. When this is true of the United States, what of the world at large?

It is very clear from such considerations that "saturation points" are mirages of the mind, the reflections of indolence or basic lack of confidence.

Until every one has what he needs, and a way of procuring it when he needs it, we have no right to talk about oversupply in this world. Of course, if everything is to remain just as it is, the borders of possibility are soon reached. But everything is not going to remain stationary. The man who keeps reaping is the man who keeps planting. And the nation that keeps selling is the nation that keeps creating buyers. There are millions of potential buyers in these United States who must be paid wages which will enable them to buy. For buyers make workers, and workers make spenders, and spenders make business, and business makes prosperity, and prosperity pays back its benefits on everyone. There is no "saturation point" in the people's reception and use of the benefits of prosperity.

# EDITORIALS

## *Crime Five-to-One Foreign*

THE too well-founded charge that our crime is not American but imported seems to have pricked the New York *Times* on several occasions. In the Whittemore case the *Times* takes up the racial sources of the criminals and says: "The leader himself is of old American stock, his wife is of German descent, the two financiers of the gang are of foreign Jewish birth, the lieutenant gunman is Italian. It is a microcosm of our whole population."

On this showing, crime is five of foreign origin to one of American. And the whole gang is not yet in evidence. When they are all rounded up the ratio will be much higher. But it will be quite useful for the *Times* to continue its attention to the matter. Every contribution from an unconvinced party makes the general contention more evident.

## *HOW?*

CONGRESS is casting about for the thing to do with reference to prohibition. The first thing to do is to enforce the law by men who believe in the law. The prohibition law has been largely in the hands of its enemies from the first. A "front" has been maintained by persecuting the minor offenders while the wholesale major conspirators have usually gone free. And there has been too much talk about what "we are going to do." The source of the greatest doubt which the public feels concerning General Andrews is that he is talking. General Smedley Butler did that in Philadelphia—very unlike a Marine—and his experience should be a lesson to other enforcement officers. What the nation asks is action. General Andrews does not need to inform us by interviews of what he intends to do. We could well forego the interviews for the pleasure of picking up the papers some morning to read of what he has *done*. In this matter, history is preferable to prophecy. Believers in the law, doers not talkers, these will show us what can be done.

## *A Sudden Squall*

ONE of the strangest outbursts of which the American press has been the vehicle was the two-day torrent of criticism which greeted the reports of Ambassadors Houghton and Gibson to the President. Newspapers pretended to think it a horrible thing that ambassadors should tell the President the truth about Russia; and yet upon examination it appeared that it was not the newspapers who thought it, but someone else, and the identity of the someone else did not appear. At the same moment the same kind of criticism was raging in England, but it cannot be that England should make such sudden use of our press!

Anyway, it all died down in two days. The assumption was preposterous that an American ambassador, seeing through the farce of European peace, should tell his Chief, and, within certain discretion, his countrymen, what the facts are.

The case is so bad that adjournment saved the shell of the League of Nations from collapsing. Mr. Chamberlain was not to blame, for his secret negotiations were in the best and most approved European manner; he was acting in a situation which left no other action possible, even though it is well known that such action always has destructive consequences, whether immediate or remote. In Mr. Chamberlain's case, the consequences were immediate. The fault was with the fatuity that four months ago hailed Locarno as the world's salvation and Chamberlain as its savior. It is just as well that Europe early learn what is false and what is true.

It appears that truth has been told at the White House. We now hopefully await active evidence that the truth is being consulted in our foreign relations.

## *Somebody Is Looking for Trouble*

IN CONSIDERING the Mexican situation it should be borne in mind that trouble between that country and the United States has long been the desire of various interests. This fact should be considered in Mexico even more than in the United States, for it is Mexico that has been playing with fire, and if the conflagration should break out, Mexico would be the chief sufferer. The United States has stated officially that it seeks not one foot of Mexican territory. Mexico is therefore relieved of all fear of aggression. If, under the security of that promise, Mexico should lend herself as the agent of those who would harass the United States, it would then be Mexico that would be chargeable with creating a new situation. There are many interests seeking trouble between the countries. Some of them originate in this country. Others abroad. There are commercial, religious, and political ele-

ments involved. It is not forgotten that Germany had a scheme whereby Mexico was to attack the United States to withdraw our attention from the World War. It is not forgotten that Mexico and Japan have been nearer neighbors than Mexico and the United States. Well-wishers of Mexico desire to see her pursue a course in harmony with the successful ideals of civilization which mark her northern neighbors. If she seeks counsel elsewhere, and orders her course on contrary lines, she is creating a situation which she will not be able to handle.

## *Reserved Against the Hour*

MR. TROTSKY takes another fling at the United States. But he does not misstate the facts. However much he may dislike the facts, he recognizes them and acknowledges them. And what he says should not alarm, but hearten us. When Trotsky storms about the United States being the greatest obstacle in the way of Communism, we should be thankful that it is so, that the conjunction of these strange times should find a nation so morally and materially impregnable that the high priest of Communism is compelled to acknowledge it. It is not for nought that the United States has come to its place of power at this time. Its mission and destiny are providential, and its service will be performed.

Mr. Trotsky's (rather Braunstein's) speech will not be without its use if it throws light upon the mission of the United States for those who have inclined to believe that the United States has evaded its mission. A nation set to do a specific work is rightly guided when it forbears to fritter its power away in trivial ends. The futile trivialities of the European political *debacle* would have included us, had our country been a party to the impossible and unnatural schemes which were offered us. And it was not due to our wisdom that we escaped the lure. It is due to some national instinct deeper than thought, some distinct direction of the national feeling about the times and their meaning. In great events nations are thus led, and it borders on something like sacrilege for men to say that the United States, in following a deep instinct, is evading its duty. What if that instinct is preserving the nation—power and vision intact—for a service the rest of the world has now unfitted itself to perform? What if the enemy, as articulate in Trotsky, sees the situation more clearly than some of our misguided prophets?

There is something in the instinct of the American people which is worth trusting. This is the lesson which some of our proponents of a false "internationalism" must learn.

## *Who Pays the Piper?*

WINSTON CHURCHILL does himself little credit and his country little service by exhuming that chimerical but strangely active corpse—the cancellation of war debts. As Chancellor of the Exchequer and a leader in the Tory party he may believe his denunciation of America a clever political move. Actually it serves only to comfort those common enemies who seek to strain friendly relations between the two nations at a time when England may need friends badly.

Churchill's picture of the United States as a land fattening on wealth "drawn from the devastated and war-stricken countries of Europe in an unbroken stream across the Atlantic" may be rhetoric, but it is nonsense.

All Europe is agreed on one panacea for its ills—letting America pay for its war. Why should we? This country was not consulted when the torch was applied in 1914. The war was not of our making. At its conception it was scarcely even of our concern. When we did enter it in the name of democracy, there was no niggardliness in men or money. Yet the politicians of Europe—setting up a claim because of this very aid—would place the whole tremendous financial burden of the war on the back of the American taxpayer.

Nor is this all: damned for his stinginess, the American taxpayer seldom retorts that he is already paying all of his own share and half of Europe's—which he is.

The United States has gone to the very limit in granting concessions and virtual moratoriums, in fathoming "ability to pay," in affixing low rates of interest. We are not (as pictured by the foreign press and politicians) a nation of Shylocks demanding our pound of flesh. There is some thought that Churchill is playing for a breakdown of the British-American funding agreement. If so he is wasting breath; to reduce financial arrangements any further would be equivalent to paying an admission fee for getting into the war.

## *Good Will*

THE only permanent good in the world is good will. Most of the differences which exist are due to the withholding of it. Good will brings many men of many minds together for the achievement of one good end. Good will even abides the trial of unwise methods, to give time for their weakness to appear, that so the advent of better methods might be hastened. Good will has the sense to wait in confidence the total abandonment of what is harmful or useless, as soon as it is found to be such. Thus good will is not mushy but wise; it discriminates without despising. It arms wisdom with amiability.

# Literary Fakers and Their Fakes

## Wherein the Delightful "Spectra" Hoax Is Told and the Eulogists of Modern and Ultra-Modern Verse Are Engulfed in Sorrow

By CHARLES J. FINGER

ILLUSTRATED BY W. O. FITZGERALD

Knish was a Russian princess and Morgan was of the soil, sturdy son of New England, so they said.

MY FRIEND William Marion Reedy, who lived and edited his *Mirror* in St. Louis, loved his joke, big-hearted grown-up boy that he was. And, because there was a consubstantiality between the man and his work, there was always a friendly sense of contact and geniality in his paper. But because of that love of fun, and because of his natural elasticity, the things he printed sometimes puzzled serious people, more so because it was pretty generally conceded that the man was pervaded by a genuine love for what is best and truest in literature.

Still, Reedy had a dark suspicion of those who professionally set out to affect the lives of others; he feared beyond all things the appearance of pontificality. As a corrective to any tendency that way, he would mildly satirize those things and ideas that he held most in esteem. For instance, when he was giving Masters' *Spoon River Anthology* to the world, he did not hesitate to run a parody making merry with the poet's philosophy whereby all the sins and shortcomings of the individual are blamed, not on the individual himself because of his lack of discipline, but on society. One verse ran:

JOHN BULL FLESHMAN

There was once a butcher
Who, for love of a chorus lady,
Disembowelled himself with a meat axe,
On her sofa.
Now I do not claim that this was
particularly wrong,
I do not condemn the man.

I simply say
That when a useful man animal
Would make such a miserable shift
Over an amour with an abandoned
woman,
There must be something rotten
In the moral fabric
Of the community which bore him.

But the Elmer Chubb hoax was his most lively coup. It had been taken for granted that Reedy would keep an even course, philosophically, not bearing in the direction of the wild-eyed reformers, nor cruising toward the restrictive wing, so when his *Mirror* came out with a mass of strange stuff written by one Elmer Chubb, LL.D., Ph.D., many were mystified. There was advocation of a national religion; there were arguments advanced in favor of all kinds of restrictive measures; there were platitudes, puerilities, asininities.

Chubb was plainly a petty-souled creature full of a wishy-washy sentimentality. And yet he seemed to have rubbed shoulders with a variegated assortment of interesting people. He was an execrable poet and bored readers with his sonnets. He was full of a lachrymose sympathy with all sorts of odd notions and theories. But who he was, no one knew, and the secret was never revealed. That Chubb was the pen name of Edgar Lee Masters was never told; but so it was.

To be a hoaxer on occasion, however, does nothing toward making one immune from hoaxes, and Reedy tripped where others tripped.

About the latter part of 1915, there appeared in different magazines of solid respectability strange poems over the names of Emanuel Morgan and Anna Knish. The *Little Review*, a very radical and advanced magazine, printed some of the effusions. The *Forum*, in its issue of June, 1916, carried a kind of exposition of aims, setting forth that the new movement would push the possibilities of poetic expression by a method not wholly different from the methods of the Futurist painters. Like *Les Jeunes*, the new school used an incomprehensible jargon; there was a flavor of the Symbolists about them; like the Vorticists they set great store on the immense importance of the "live word" which was to dazzle, to shock, to stun. Emanuel Morgan expressed his genius in metrical form and rhyme. Anna Knish chose the medium of a verse free to the point of looseness. I quote Morgan:

OPUS 15

Despair comes when all comedy
Is tame
And there is no tragedy
In any name,
When the round and wounded breathing
Of love upon the breast
Is not so glad a sheathing
As an old brown vest.

Asparagus is feathery and tall,
And the hose lies rotting by the garden
wall.

The Anna Knish style may be judged from this specimen:

OPUS 118

If bathing were a virtue, not a lust,
I would be dirtiest.

To some, housecleaning is a holy
rite.
For myself, houses would be empty
But for the golden motes dancing in
sunbeams.

Tax assessors frequently overlook
valuables,
Today they noted my jade,
But my memory of you escaped them.

Today it seems incredible that sapient editors could be played with as they were, but, apparently, they were overcome by a vague respect for the mysterious non-understandable. One famous magazine of revolt called *Others, A Magazine of the New Verse*, accepted and printed this in all seriousness:

. . .
There is a stone wall, leading to a
motherly tree,
Which clicks with the flickering caress
And parts for the leap—
And you, beloved,
Are a Nut.

As if this thrust did not suffice, Morgan had, in another place, this piece of challenging sarcasm:

Smell me, a dead
fish . . .
Taste me, a rotten
tree . . .

while Anna Knish, challenging in her turn, talks in her Opus 80 about her house of glass, and, taunting the editors who accepted all in grave seriousness, says:

Sometimes
I am terribly
tempted
To throw the
stones myself.

Viewed in retrospect it all looks like a piece of transparent impudence that would deceive no one, but deceive it did. To be sure there were hard-headed fellows in the business world, and some in the world literary too, who, having read the poems gave up all attempt to make sense out of them as hopeless. Others saw in them nothing but dementia, but on them was poured hot sarcasm by the illuminati. For what could Philistines who praised Whittier and Burns be expected to know of such highly idealized art? How should Tom, Dick and Harry comprehend human thought when it was idealized to such a point of refinement that none but the rare intelligentsia could appreciate it? So there was wordy warfare, and much was said about metaphysical moralists, and more was said that was scornful of the ruder barbarians.

Meanwhile there were columns of ingenuous gossip over the personalities of the authors. Knish was a Russian princess who wrote in English and lived in Italy. Morgan was of the soil, the sturdy son of sturdy New England ancestors, and so on. Knish, said one close critical student of contemporary literature, was "lyrically whimsical,"

***The Advent of the Book Called "Spectra"***

and Morgan was quaintly paradoxical, but "through the veil the attentive ear could recognize the golden quality of the notes" though they "would never penetrate into the public consciousness."

Then, in 1916, Mitchell Kennerley published for Anna Knish and Emanuel Morgan a thin volume called *Spectra, A Book of Poetic Experiments*, and, lo! and behold, there was a very favorable press. Here at last was something new, something strong and primal. Here was something not derived from Swinburne, or Tennyson, or Browning, or any other verse-maker. Here were very perfect exponents of their age. Here was the magnificent result when the restricting bonds of tradition were loosed. Here, in a word, was a wreath to place on the tomb of the fundamentalists.

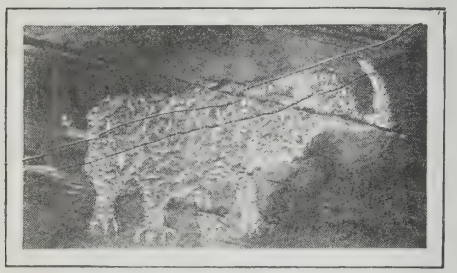
Among others, Reedy fell for the hoax, though his panegyric was accompanied by some reservations. "Vitalized grotesques," he wrote of the poems in his *Mirror* (Vol. xxv, No. 47, page 768), "vitalized grotesques which at first seem like parodies of some recent new poetry." There you catch the ghost of suspicion. Still, he was a man who cultivated a tolerance of opinion not his own, and did not stop with that first sound judgment and true impression. "I think," he continued, "they are a distillation of pure joy in the senses and the incalculable friskiness of thought and fancy."

***Then Came the Flash of Lightning***

But other critics were more bold, and, in torrents of verbosity, plumed themselves upon their acumen and paraded their discovery as a glittering achievement. John Gould Fletcher suspected nothing, and, [from his London home, praised the "vividly memorable lines." So the great day of liberation was hailed. For the traditionalists there was nothing but darkness and death.

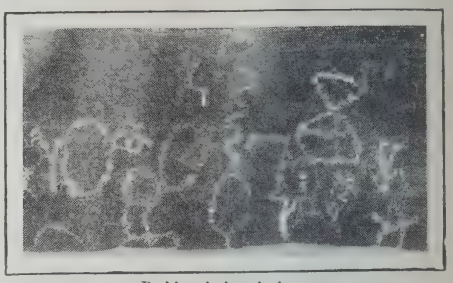
Then out of a clear sky came a lightning flash. Anna Knish yielded to that temptation to throw the stone into the glass house she had builded, and there were splinterings and crashings and smashings. Off went her mask, and it was no seething imagist of a Russian princess who stood revealed, but, instead, a young soldier poet, a commissioned captain, then on the point of embarking for Europe. It was Arthur Davison Ficke, well enough known for his work—always finished and artistic, always harmonious and intelligible. His partner in the hoax, Emanuel Morgan, was Witter Bynner, also a poet, the subject matter of whose verse can be understood, and enjoyed too, by learned and unlearned alike. So a great silence fell on the critical world, and some who had found an occult meaning in that

And you, beloved,
Are a Nut



retired into themselves and indulged in lonely visions, or else went apart to weep with those that wept. They had chanted loud odes and the crash left them dumb.

But elsewhere there was world laughter, just as there had been world laughter when Molière raised the laugh against preciosity with his *Les Precieuses Ridicules*, in 1659. And (Concluded on page 26)



Apparently the editors were overcome by a vague respect for the mysterious non-understandable.

# A Dinosaur Breaks Into History

Petroglyph of rhinoceros.

## If Man Drew a Pictograph From Life, It Upsets Many Theories

Prehistoric inscriptions.

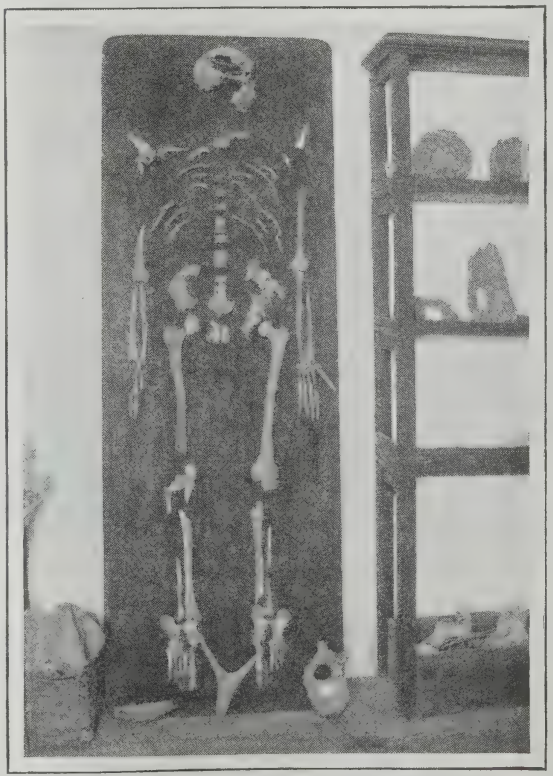
By SAMUEL HUBBARD

THE discovery by the Doheny scientific expedition of a petroglyph, or rock drawing, of a dinosaur, in Arizona, raises the question regarding the antiquity of man. Was man present during the Triassic Period when dinosaurs flourished? Most evolutionists, geologists and paleontologists have answered emphatically *No* to this question.

One scientist who saw the dinosaur picture said: "It looks more like a dinosaur than anything else, but if I admit it is a dinosaur that upsets all of our theories regarding the antiquity of man, and even changes our conclusions about geology, and I am not prepared to do that on the evidence of only one such pictograph."

As against that argument, however, there is only one part of the brainpan and one leg-bone of the celebrated *pithecanthropus erectus*, and from these fragments a brief has been filed connecting man with the apes. Also a single molar tooth has been found in Wyoming. Upon this evidence it is claimed that the great apes once lived in America.

The proponents of evolution describe to us the orderly succession of life on this planet, from the lower single-celled forms up to the complex creatures we find today. From seaweeds to mollusks; mollusks to fishes; fishes to reptiles; reptiles to birds and mammals, and last of all appeared man. Most of us have accepted this statement without question, because the facts seemed to point that way. *But if man actually saw a live dinosaur, and drew a picture of one, then that statement is not true.*



On close analysis it is seen that the idea that man was the last animal to evolve is not really based on provable facts, but is an assumption that such must be the case. Scientists have arrived at this conclusion because the remains of prehistoric man have so far been found only in the more recent formations.

Our present knowledge of prehistoric man is mostly obtained from caves in Europe. Discovery following discovery has put man's advent further back into the past. The records of the Egyptian priests showed an organized civilization more than 10,000 years B. C.; then there was a jump to 20,000 years; then came the Neanderthal man; the Heidelberg man; the Piltdown skull, and finally the celebrated *pithecanthropus erectus* or ape-man of Java. In point of time these go back 50,000 years, 100,000 years; even 500,000 years. Some scientists now talk about man having been on earth one million years ago, without seeming to tax credulity.

The remains of prehistoric human beings are most difficult of all to find. "Earth to earth and dust to dust" is no mere figure of speech. Human bones turn into dust. Even in a dry, desert climate like Nevada or Arizona, you open a burial vault, and there in the midst of the gray sand that litters its floor is a yellowish brown circle of dust which, on analysis, proves to have been human bones. There is nothing to show what the man looked like or how long he had been dead.

The caves in Europe are nearly all in a limestone formation, and the water percolating through this limestone has fossilized the bones and aided in their preservation.

Just on the frontier between France and Italy, a bold headland juts out into the blue Mediterranean. On account of its red color it is called *Les Rocques Rouges*. A long narrow slit faces the sea, but widens a little as you go in, and forms the *Cave of the Barma-Grande*. It is about halfway between the French town of Mentone and the Italian town of Ventimiglia.

Skeleton, 7 feet 2 inches high, found in the Cave of the Barma-Grande, near Mentone, France.

An Englishman, who became interested in the exploration of this cave, not only excavated the accumulation of rubbish in the cave itself, but he built a small museum called the *Prehistoricum* to hold and exhibit its contents.

The original floor line of the cave is some 54 feet above the present floor level. At a depth of 34 feet five skeletons were encountered. These had apparently been buried in the fireplace, as the bones were mixed with ashes and charcoal. One was the skeleton of a very powerful man of middle age. He was 7 feet 2 inches tall. Another was a young girl about 18 years of age, and the third a youth of about the same age. The boy was 6 feet 6 inches tall, and the girl was over 6 feet. In the hand of the girl was a long obsidian dagger, similar in workmanship to the spear points made by our California Indians; around her neck was a necklace made of the vertebra of salmon.

These two skeletons were left *in situ;* a box with a glass cover was built around them. The skulls showed a race of people fully as intelligent as our

own. They have been classified as the Grimaldi race, an offshoot of the Cro-Magnon, from whom the people of Europe are supposed to be descended.

It was estimated by scientists that the accumulation of detritus over these bodies to a depth of 34 feet, required at least 20,000 years. My personal opinion is that this is an underestimate. At lower depths, beneath these human skeletons, were found the bones of the mammoth, woolly rhinoceros, reindeer, horse, aurochs, great cave bear, and other animals.

In our Arizona cañon we find a different problem to solve. On the walls of the Hava Supai Cañon we find where prehistoric people, of unknown ancestry, have drawn pictures of animals long since extinct in America. How long these animals have been extinct no one really knows, but the method by which these pictures are made indicates great antiquity. They might easily be a million years old, perhaps more. They are deeply cut through the black oxide, or "desert varnish," which forms on some of the red-sandstone walls in this cañon. The only way they can disappear is to "weather off," which in this dry desert climate would require a time too great to compute.

I explored this cañon some 30 years ago. I saw these pictographs at that time and described them on my return. Mr. Doheny and his prospecting party were there some 15 years prior to my visit. General Crook, of the United States Cavalry, had been in there, and the infamous John D. Lee, of the "Mountain Meadow Massacre," had found sanctuary in this wild spot, in his vain endeavor to hide from United States marshals.

The suspicion that these petroglyphs might have been executed by cowboys or prospectors is too absurd to be considered. I know of wall-writings in this cañon which are absolutely inaccessible. The way up to them has long since disappeared and caved off. They can only be seen from a distance with field glasses, or closely examined by bringing in expensive equipment. This is also evidence that they were not done by any of the Indian tribes at present inhabiting this region.

One of the big questions at issue in this matter is, how old is the Supai Cañon? Was it in existence when the dinosaur made the tracks we found and described out in the "Painted Desert"? Was it formed during the Triassic Period, or at a much later date? If it was eroded at a later date then did dinosaurs persist long after the Triassic Period ended? If dinosaurs came down into the age of mammals, why don't we sometimes find their bones mingled with mammal bones?

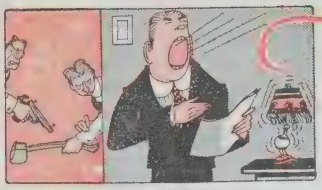
Frankly I do not know the answers to these questions, and furthermore I do not know any one who does. This whole subject involves a profound knowledge of geology, with special reference to a study of this region. As my opinion would carry no weight I do not venture to give it, but shall confine myself to those things I have seen and can interpret.

America's renowned Grand Canon, showing the Colorado River, thousands of feet below, eating its way deeper and deeper into bed rock.

And yet, when I attempt to draw a pen-picture of this vast region, and try to visualize it to those who have never been there and seen it for themselves, I am simply overwhelmed with the hopelessness of the task.

When you make your painful way down into one of these great gashes in the earth, you feel like a tiny parasite crawling around in a wrinkle of the skin of some huge monster. Stand with me for a moment on the very rim of the Grand Cañon. At your feet is a gulf so huge and so uncanny that it is beyond all your previous experience. There is nothing in your past that you can measure it by.

When I tell you it is a mile deep and from 12 to 18 miles across, the figures have little significance. But when I prove to you that that picket fence on the north rim is in reality a forest of tall trees, the immensity of it all begins to creep into your consciousness.



Next I show you my barometer with the needle registering 6,700 feet above sea level, and then I show you where your heel is grinding a petrified clamshell into dust. When I demonstrate that the Kaibab limestone you are standing on contains millions of these clamshells, and that it is in truth the bed of an ancient sea, you begin to realize that strange things have happened here in the past.

Then I point out Red Butte, an isolated peak rising above the plain, crowned with a sinister cap of black lava. I explain to you that that is all that is left of 4,000 feet of sedimentary strata which towered above the spot you are standing on. What great cataclysm swept away 4,000 feet of sandstone, limestone and shale, covering hundreds of square miles of territory? If you could have stood on the rim of the cañon as it was then, you would have been looking down into a gorge 10,000 feet deep, instead of the puny colossus of today with its mere 5,000 feet of vertical depth.

And when you ask me what mighty Titan carved this huge gorge, for answer I tell you to listen. Out of the deep abyss at your feet there comes a low rumbling sound, like the deep-throated growl of some primitive monster. You look, and down there, between perpendicular walls, rushes the tawny red streak of that terrible river, even now eating its way deeper and deeper into the black Archean granite, the very bed rock of the world.

And now, when I tell you that strange peoples worked here, and left their "records in the rocks"; and strange animals left their footprints in sandy shores, which have long since turned into stone; and the salt waves of the sea once dashed their spray upon the mountain tops; and huge volcanoes, beside which Vesuvius would have looked like a pimple, spilled their horrid brew over the face of the land, you will understand why I put my pride in my pocket, and in all reverence and humility stand in the presence of this GREAT THING, which is still waiting for an interpreter, and frankly admit that I don't know what it all means.

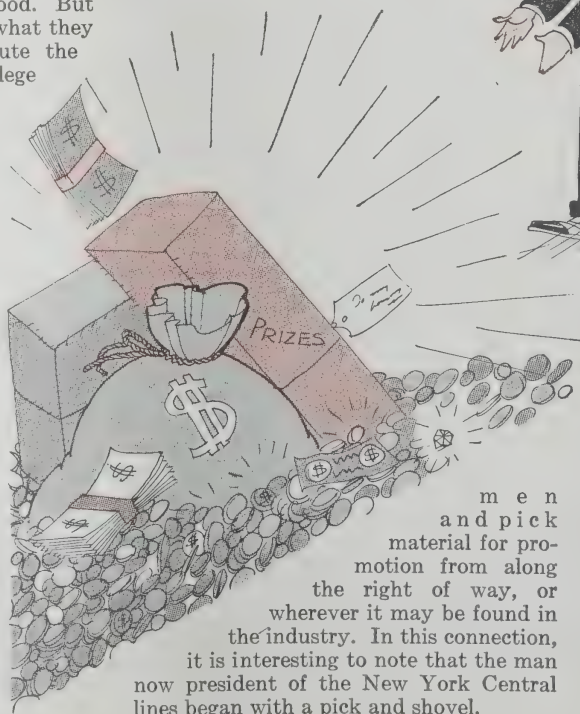
Prehistoric man was in a state of continual warfare with the great Carnivora of his day, or else he was fighting against other tribes of men. In either event he had a horror of being eaten.

In learning to sing, disregard the neighbors.

# What to Do to Make Life Worth While

## Many People Consider That a College Education and "Success" Are Synonymous, But Here Are Some Who Are of the Opposite Opinion

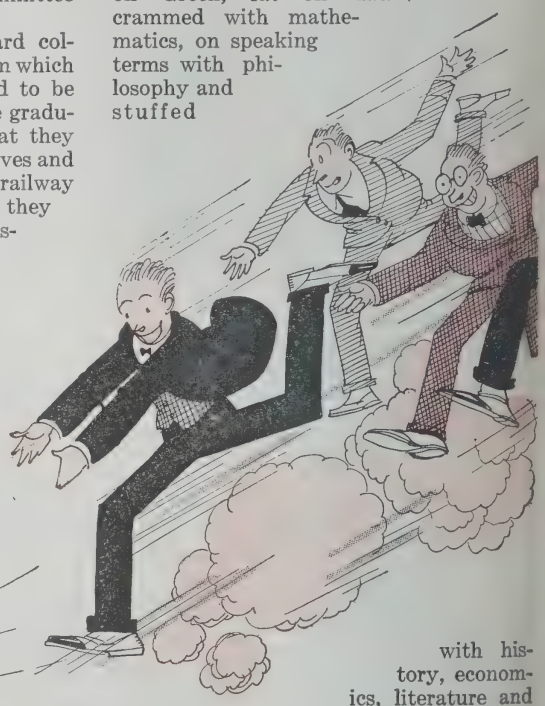
JUST when the word "success" was put into the dictionary does not much matter. A hundred years ago—fifty years ago—the majority of Americans were content to get along as best they could and let it go at that. There is no record that Lincoln's parents ever worried about his education. His stepmother may have helped him a little with the pine knot by which he read his history, but apparently even she never had any dreams for him. Parents were content to let the future take care of itself, apparently believing that no amount of planning could much alter it.



We have changed quite a little in the last 50 years. We have changed so much, in fact, that never before did the world behold such a spectacle as now exists in the United States. We have discovered the word "success" in the dictionary, and from its printed page it blazes out at us as if it would burn the paper. We have associated success with education, with the result that all the colleges we can build—or at any rate, all we have built—are not enough to hold the students. Our passion for sending our youth to college is without parallel, anywhere at any time.

We have technical schools for those who would be engineers, law schools for those who would be lawyers, and all that, which is logical and all to the good. But those who do not know exactly what they want to do—and they constitute the great majority of American college students—take a general cultural course, serene in the belief that a college education will be of great help to them in whatever they may choose to do. That is because the great reason in America for going to college is to become a success in life. A college education is supposed to pave the way to success in anything. Young men go to college now in order that they may make money later.

How cheap success would be at such a price! Four years in college and then, presto, a flying start down whatever path one might choose, with rewards, emoluments, prizes and riches coming with increasing frequency and in larger packages to the end.



Yale University has done a real service in showing exactly what this sort of striving for success has led to in one industry. Yale appointed a committee to make a survey of its graduates and the graduates of other colleges in the field of transportation. The inquiry extended over a period of ten months, 300 leaders in the business of transportation were interviewed, a hundred transportation agencies were combed for facts, 20 universities and technical schools were visited; and this is what the committee found:

Railway executives do not regard college graduates as good material from which to select those who are to be trained to be executives. They say that college graduates are not "steady pluggers," that they have too high an opinion of themselves and are too eager for promotion. One railway president said that such men, when they begin, are liabilities rather than assets. There is little or no demand from railways for college graduates merely because they are graduates. They prefer to train their own men and pick material for promotion from along the right of way, or wherever it may be found in the industry. In this connection, it is interesting to note that the man now president of the New York Central lines began with a pick and shovel.

Yale's survey was confined to transportation, but the facts must be the same with regard to every other industry. It must be true of manufacturing, merchandising and every other similar activity, and for the same reasons that it is true in transportation.

Obviously, the reason why college men are not sought by transportation companies is because they know nothing about transportation. They come from their studies knowing, one might say, almost everything except what, if they are to be transportation workers, they should know. They may be long on Greek, fat on Latin, crammed with mathematics, on speaking terms with philosophy and stuffed with history, economics, literature and many other subjects but they cannot run a locomotive, fire a freight engine, dispatch trains, make out a tariff schedule or a time-table. A man who can operate the levers in a signal tower knows more about railroading than the whole crew of them. He learned what he knows about railroading while they were in college learning something else.

Now, the rewards of modern industry are for those who know how to make modern industry function in the best possible manner. Whoever would get these rewards must be a man of facts. He must know his business. What he does not know about something else will have absolutely no bearing upon his success in his particular field, which will always be in exact pro-

tion to his special knowledge of that
d.

The best way to learn how to do any-
ng is to do it. If you want to learn how
sing, don't take a mail order course,
d all its literature, and not make a
se until you think you are ready to
pear in grand opera; don't do that—
your lungs, disregard the neighbors,
l sing. You will make some kind of a
awk, anyway, and any kind of a noise
step toward singing. So it is with rail-
ding or anything else. The best
ce to learn railroading is on a
road. The best place to
rn manufacturing is in a
nufacturing estab-
ment. If one
not learn a

Four years in college and then, presto, a flying start down whatever path one might choose with riches and rewards awaiting.

industry. The place to learn about industry is in industry. Whoever goes to college to make money will not make it. And whoever neglects to equip himself to earn a reasonable amount of money will not be able to enjoy a cultural education, no matter how much of it he may have. The body comes first, then the mind.

But the mind comes upon the heels of the body. The moment man is fed, clothed and housed he seeks to enjoy his mind by using it. A cultural course, such as one may take at college, turns the mind toward some of the things that it may enjoy. But there is no such thing as getting a cultural education even in college. All anyone can do is to begin it there. Whoever gets it must keep at it for life. And it may be got without going to college at all. It can be obtained with any fullness only by a lifetime of reading and reflection.

The books in college make but a small group in comparison with the books outside. If "reading maketh a full man," the only place one can become full is at home where it will take him all his years to do it. If there were any way that the young could be induced to form the habit of reading while still in high school, it is a grave question whether colleges, as they are now organized, would find much that they could do.

It is a very serious thing for a young man who has his way to make in the world to take four years off to go to college while the young men who are destined to be his competitors in the struggle for existence are learning their business where men know how to teach it; that is to say, in business. A bright youth in industry will, in four years, gain such a lead over a bright boy in college that it is more than likely the bright college boy will never again catch sight of him.

It is also a very serious thing for a bright boy to go into industry, read nothing but the sporting pages of the newspapers, and never give a thought to anything except his work. Sooner or later he must begin reading or he will never do much thinking except about his work. And no work is big enough to fill a man's life.

There is something in human nature that reaches out beyond the job and tries to get in touch with everything in the universe. Nobody is satisfied just to know himself. Those who read nothing but the sporting pages at least want to know about the sports. It is their effort at understanding, and the more one knows something about, the richer is his life.

Making the most of one's life is, therefore, a matter of promoting two lines of development. One line, by providing money, makes life possible, the other, by providing appreciation of things worth while, makes life rich. No amount of money is worth so much as a taste for good books. Friends die or move away, but good books remain. Good books are whatever are good for you. No book is good for a reader if he cannot understand it. As the understanding increases, taste calls for something more solid. But solid does not mean soggy. Books that are good for a reader always interest him.

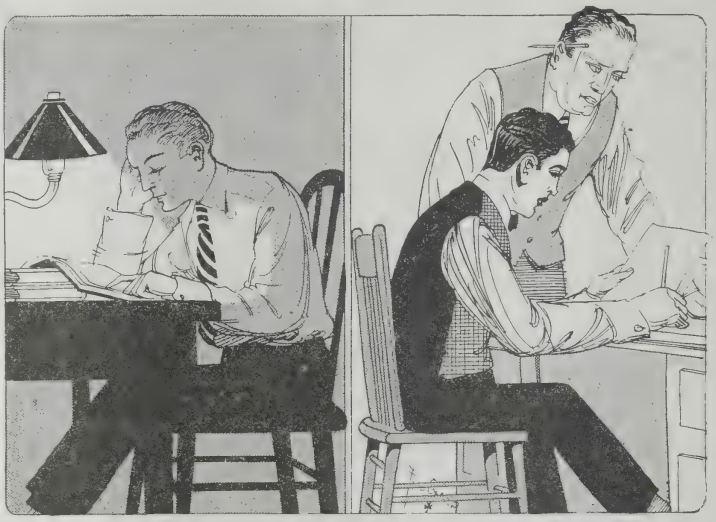
What kind of books are interesting? All kinds. Or, rather, all subjects are interesting if they are handled by somebody who has something to say and says it. The North Pole may be a bit cold, but many a hot book has been written about its vicinity. Everything in the world is interesting if it is told as it is. One will, therefore, always do well at least to take a dip into every book upon which he can lay his hands. Read to be informed, read to be amused, even read once in a while to see what an ass the author is. Sometimes there is no pleasure greater than this.

The tragedy of many millions upon this earth is not alone that they have so little, but that so little is in them. Little is in them because they never put much in. Things worth while can be put in only through the mind, and the mind is fed only through the eyes and ears. A craving for good books is worth more than any college education because it lasts for life while college ends in four or five years.

Industrial workers should be, and some day will be, the best educated men and women in the world, because they will know both how to do things and how to appreciate things. He hops along on one leg who has technical skill without ability to take in and comprehend the world about him, or who has understanding and

ere it is being done he certainly cannot
rn it where it is not being done. And
at this world wants is men who know
w to *do* things. That is because things
ve to be done in order to serve the world
th material goods.

Anyone can serve you who can do the
ing you want done, even though he
ows how to do nothing else, but no one
n serve you who cannot do the thing you
nt done, even though he should know
w to do everything else in the realm of
lustry.



Nor is this an argument in favor of
niting the knowledge of man to the re-
irements of his particular occupation.
is not an argument of any sort. It is an
ort to straighten thought. It is an
tempt to prevent people from going to
e delicatessen when what they really
nt can be found only at the hardware
re two blocks up the street.

When Yale tells the world that college
apparently no place to learn how to
n a railroad, you should be able to tell
urself that it is no place to learn any-
ing connected with the operation of

appreciation without technical skill. Always and forever, variety is the spice of life. Reading is never so enjoyable as after one has worked with his hands a while. Nothing but reading cracks the nerves and makes the children flee for safety.

No doubt about it, we shall have to revise our ideas of what constitutes education and of the relationship between the completion of a course in college and the acquisition of money from industry. There is no relationship between college and industry. College stands for appreciation, industry for production and the ability to appreciate is not the ability to produce. Some of the smaller colleges know this, Yale is apparently beginning to suspect it, and all of those who are now going to college will later find it out to their sorrow.

The American desire for success is commendable, as is the American desire to learn, which is but another way of saying that American colleges are destined to undergo a great change. They will be more like technical schools and less like universities. The accent will be placed upon production, with appreciation second. Every student will be taught how to *do* some useful, productive thing, and while he is learning it he will be taught how to appreciate the many things in the world that have no sort of relationship to the industrial art he learns. Some of these arts can be taught as well in college as anywhere else, but railroading and deep-sea navigation are not of this number. College will then have its great value because it will be teaching the young both how to produce and how to appreciate, how to make each apart of their daily lives. That is life and nothing else is.

It is a very serious thing to take four years off to go to college while the young men who are destined to be competitors are learning where men know how to teach.

We can already see the currents flowing in this direction. On the one hand we see great industrial organizations—a few at any rate—offering cultural education to their employes by means of night schools. These schools are but a beginning, yet they are a beginning and they prove the recognition by both employers and employes of the need for both kinds of education. And we also see technical schools and a few small colleges that teach students both how to work and how to enjoy the world in which they live.

The colleges that are still providing "general courses," without apparent recognition of the fact that the first necessity of life is to know how to do something useful, are largely wasting their time and the time of their students. And what an army of such students there is! They are trying to learn how to make money when all that colleges know about money is that rich men give it to them.

# The Drama of Our Youth

(*Concluded from page 8*)

father, or jolly Ned Cole. Anyway it was sure to be some neighbor who had a friendly word for every comer.

The hall—it had no other name, but was ever designated simply and impressively as the hall—was, in my eyes, literally a glorious blaze of light. It mattered not that the blaze was produced by means of numerous ugly brass kerosene lamps. The hall was a familiar place. I often accompanied mother there to the sewing circle meetings on Wednesday afternoons; I ate there almost every Saturday at the Village Improvement Society supper. I really knew the hall thoroughly, all its nooks and crannies, all its possibilities; and yet on a "drama night" I always felt I did not recognize it. It seemed miraculously to be converted into a strange, magic room where the most amazing happenings might occur.

I would make my way to one of the three or four backless benches placed in front for children which, oddly enough, never seemed hard or tiring. These benches were invariably crowded with wide-eyed, expectant children impatient for the performance to begin. We used to gaze at the crude, improvised curtain (which had a fixed habit of getting stuck) with admiration and awe.

"Bet my father's the best one in it!" Billy Stinson was whispering and nudging me at the same time.

I tried to edge away, for I hated to be nudged, but I only succeeded in pushing against Sybil Bruce who made a vigorous protest.

"Your father's going to be the villain, ain't he?" again whispered Billy. "Gee, I'm glad my—"

The rise of the curtain fortunately interrupted Billy's sentence. From that moment on we were all absorbed in the play. I was not conscious of sitting on a hard bench with a group of hot little wriggling boys and girls, in a stuffy room smelling of kerosene. I was in another world, far from home, with people I knew and yet did not know. Secretly I wished my father were not the villain, or anyway were not the man no one seemed to like. I nearly screamed when he was pushed down through the trapdoor. I wanted to call out not to hurt my dear father. But I comforted myself with the thought that it was not all absolutely real and that father was not truly being hurt.

The time he was the cruel slave owner in *Uncle Tom's Cabin* I cried right out, though, and had to go back and sit in mother's lap. *The Hidden Hand* was a creepy story. When that white ghostlike hand kept appearing and frightening the characters on the stage, and scaring me, too, I found it hard to realize it was just Sister Sue's hand, and that at home I'd heard her tell all about it over and over again. I liked best the play in which Aunt Belle had a comic rôle and where everyone repeatedly said of her, "Mis' Peasley, she's a bouncer!" How I laughed and laughed whenever those lines were spoken!

But even amateur theatricals, be they ever so interesting and exciting, must have an end. The curtain inevitably had to go down for the last time, and I had to prepare to go home, not, however, before I had ecstatically greeted father, Sue, and Aunt Belle in their wondrous make-up and queer stage costumes. I always begged to stay to the dance afterward, for an after-the-play dance was always a big part of the evening's entertainment for all except the youngest members of the audience. Even we were usually permitted to go into the grand march, and to stay long enough to watch a Portland Fancy, one quadrille, or a lancers. I used to get so excited when Len Evans finished tuning his violin, nodded to Miss Abbie Cole at the piano and began calling off: "Balance your partners . . . Up and down the center . . . Ladies' chain . . . All hands round . . . Forward and back . . . First and every other couple pass through!"

Reluctantly I would allow myself to be dragged away from the gay scene. I would clasp my mother's hand and stumble sleepily along the dark road home, sorry when I could no longer hear the strains of our two-piece orchestra.

"Oh, mother, wasn't it a lovely drama?" I would exclaim. "I think father was 'bout the best one in it, don't you?"

Of course mother agreed. Just as I was being tucked into bed I would murmur, "I'll be glad when I'm old enough so's I can stay way through a dance after the play."

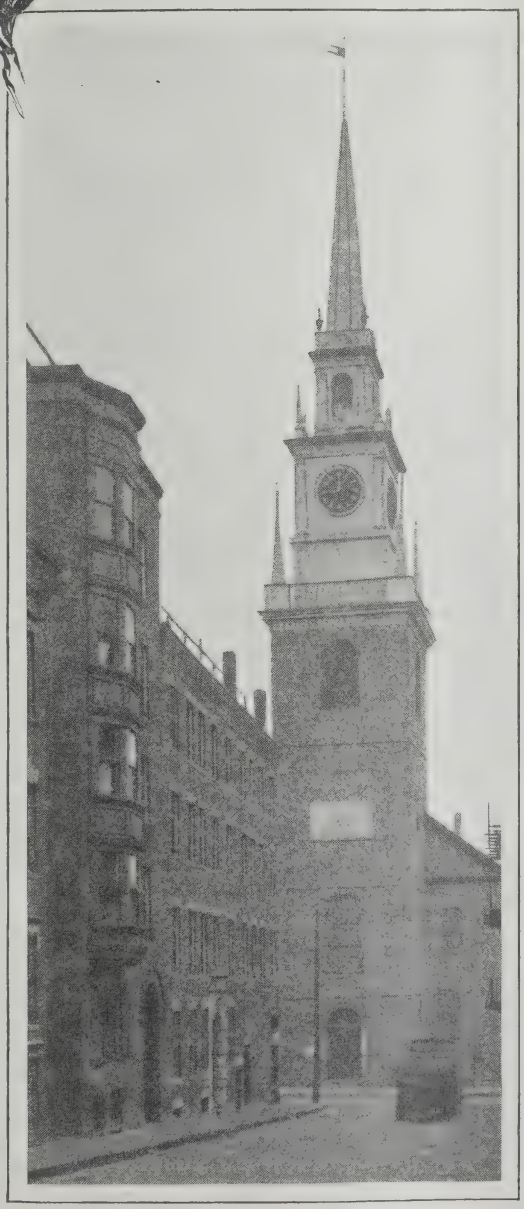
# Paul Revere Tells His Own Story

## Family Archives Furnish New Light on Patriot's Famous Ride to Lexington



ONE hundred and fifty-one years ago this week, Paul Revere clattered out of Boston on one of the most memorable rides in history. The story of the ride has been made imperishable by Longfellow's stirring poem. Here is the account of it given by Revere himself, found not long ago among the family archives. It is given verbatim:

Paul Revere, of Boston, in the Colony of Massachusetts Bay, in New England: of Lawfull Age, doth testify and say, that I was sent for by Docr. Joseph Warren, of said Boston, on the evening of the 18th of April about 10 o'clock; when he desired me "to go to Lexington, and inform Mr. Samuel Adams and the Hon. John Hancock Esq. that there was a number of Soldiers, composed of Light troops, and Grenadiers, marching to the bottom of the Common, where was a number of Boats to receive them, it was supposed that they were going to Lexington by the way of Cambridge River, to take them (Messrs. Adams and Hancock) or go to Concord, to destroy the Colony Stores."

I proceeded immediately and was put across Charles River and landed near Charlestown Battery, went in town, and there got a Horse. While in Charlestown I was informed by Richd. Devens, Esqr. that he mett that evening, after Sun sett, Nine Officers of the Ministerial Army, mounted on good Horses, & Armed going towards Concord. I set off, it was then about 11 o'clock; the Moon shone bright.

I had got almost over Charlestown Common, towards Cambridge, when I saw two Officers on Horseback, standing under the shade of a Tree, in a narrow part of the roade. I was near enough to see their Holsters & Cockades. One of them started his horse towards me, the other up the road, as I supposed, to head me should I escape the first. I turned my horse short about and rid upon a full gallop for Mistick Road, he followed me about 300 yardes and finding he could not catch me returned. I proceeded to Lexington thro Mistick and alarmed Mr. Adams and Col. Hancock. After I had been there about half an hour Mr. Daws arrived, who came from Boston over the neck; we set off for Concord & were overtaken by a young gentn. named Prescot, who belonged to Concord, and was going home; when we had got about half way from Lexington to Concord, the other two stopped at a House to awake the man, I kept along. When I had got about 200 Yards ahead of them I saw two officers as before. I called to my company to come up, saying here was two of them (for I had told them what Mr. Devens told me and of my being stopped); in an instant I saw four of them, who rode up to me, with their pistols in their hands, and said, ——— ——— you stop, if you go an inch further you are a dead Man. Immeditly Mr. Prescott came up; we attempted to get thro them but they kept before us, and swore if we did not turn into that pasture they would blow our brains out, (they had placed themselves opposite to a pair of Barrs, and had taken the Barrs down) they forced us in, when we had got in Mr. Prescot said put on. He took to the left, I to the right towards a Wood, at the bottom of the pasture, intending when I gained that, to jump my Horse & run afoot; just as I reached it, out started six officers, siesed my bridle, put their pistols to my Breast, ordered me to dismount, which I did. One of them who appeared to have the command there, and much of a Gentleman, asked me where I came from; I told him, he asked what time I left it: I told him, he seemed surprised, and said, Sir, may I crave your name. I answered my name is Revere, what said he, Paul Revere; I answered yes; the others abused me much; but he told me not to be afraid, no one should hurt me. I told him they would miss their Aim. He said they should not, they were only waiting for some Deserters they expected down the Road. I told him I knew better I knew what they were after; that I had alarmed the country all the way up, that their Boats were catch'd aground, and I should have 500 men there soon; one of them said they had 1500 coming; he seemed surprised and rode off into the road and informed them who took me, they came down immeditly on a full gallop.

One of them (whom I since learned was Major Mitchel of the 5th Regt.) clapd his Pistol to my head and said he was going to ask me some questions, if I did not tell the truth, he would blow my brains out. I told him I esteemed myself a man of truth, that he had stopped me on the highway, & made me a pris-

*Ewing Galloway, New York.*

Old North Church, Boston. From the tower of this church Paul Revere received the signal by lantern which bade him begin his famous ride of April 17, 1775.

oner, I knew not by what right; I would tell him the truth; I was not afraid. He then asked me the same questions that the other did, and many more, but was more particular; I gave him much the same answers; after he and two more had spoke together in a low voice he ordered me to mount my horse, they first searched me for pistols.

When I was mounted, the Major rode up to me & took the reins out of my hand and said by ——— Sir, you are not to ride with reins I assure you; and he gave them to an officer on my right to lead me. I asked him to let me have the reins & I would not run from him, he said he would not trust me; he then ordered 4 men out of the Bushes and to mount their horses; they were country men which they had stopped who were going home; then ordered us to march. He then came up to me and said: "We are now going towards your friends, and if you attempt to run or we are insulted, we will blow your Brains out." I told him he might do as he pleased. When we had got into the road they formed a circle and ordered the prisoners in the centre & to lead me in the front.

We rid towards Lexington a pretty smart pace; they very often insulted me calling me —— Rebel, etc., etc., The officer who led me said I was in a —— critical situation. I told him I was sensible of it. After we had got about a mile I was delivered to the Sergant to lead, who was sight of the Meeting House, we heard a Volley of guns fired, as I supposed at the tavern, as an Alarm; the Major ordered us to halt.

He asked me how far it was to Cambridge and many more questions which I answered; he then asked the Sergant if his horse was tired, he said yes; he then Ordered him to take my horse; I dismounted, the Sergant mounted my horse; they cutt the Bridle & saddle off the Sergant's horse & they told me they should make use of my horse for the night and rode off towards Cambridge down the road. I then went to the house where I left Messrs. Adams and Hancock and told them what had happened; their friends advised them to go out of the way; I went with them about two miles a cross road; after resting myself, I sett off with another man to go back to the Tavern, to enquire the News whether the troops had come or were coming; we were told the troops were within two miles.

We went into the Tavern to get a Trunk of papers beloning to Col. Hancock; before we left the House I saw the Ministerial Troops from the Chamber window coming up the Road. We made haste & had to pass thru our Militia, who were on a green behind the Meeting house, to the number of 50 or 60. It was then Daylight. As I passed I heard the commanding officer say words to this purpose. "Lett the troops pass by & don't molest them without they begin

*Ewing Galloway, New York*

Where Revere aroused Samuel Adams and John Hancock, at Lexington, on the night of April 17, 1775.

Ordered to take out his pistol and, if I run, to execute the Major's sentence;

When we got within about half a Mile of the Lexington Meeting house we heard a gun fired; the Major asked me what that was for, I told him to alarm the country; he then ordered the other four prisoners to dismount, they did, then one of the officers dismounted and cut the Bridles and Saddles off the Horses, & drove them away, and told the men they might go about their business; I asked the Major to dismiss me, he said he would carry me, lett the consequence be what they will; He then Ordered us to march; when we got within first." I had to go a cross road but had not got half gun shot off, when the Ministerial Troops appeared in sight behind the Meeting House; they made a short halt, when a gun was fired. I heard the report, turned my head and saw the smoake in front of the Troops, they immeditly gave a great shout, ran a few paces and then the whole fired. I could first distinguish Iregular firing, which I suppose was the advance Guard, and then platoons. At the time I could not see our Militia, for they were covered from me by a house at the bottom of the Street. And further saith not.

(Signed) PAUL REVERE.

# A Modern Mississippi College

THE Mississippi Agricultural and Mechanical College, established under the Land Grant Act of 1862, is one of the most progressive agricultural institutions in the South. Its physical plant, at Starkville, Mississippi, consists of 4,300 acres of valuable farming land and nearly four score buildings. A half-hundred of these structures are residences for the college staff of approximately 65 professors, instructors and scientists. A Young Men's Christian Association building has been completed in recent years, and $1,000,000 expended on other buildings.

Instruction at the college is designed to develop the minds and interest of the students in knowledge of the sciences that underlie agriculture and the mechanical arts and to provide practical experience in these activities. The State Experiment Station, an adjunct of the college, annually carries on experiments which result in saving millions of dollars for Mississippi planters and farmers. Four large branch stations specialize in the investigation of soil and crop problems.

Through the most extensive and detailed investigations in the annals of animal husbandry, a type of mule ideally adapted to the climatic and farming conditions of the South has been evolved.

The college has boosted hog production by the introduction and popularization of purebred stock and by educating farmers to vaccinate all hogs against cholera. It has taught the farmers the value of diversification. It has demonstrated the need of fertilizing the soil and of maintaining livestock. It has shown the producers how to eradicate objectionable insect pests and how to improve the quality of grain. Briefly it has reshaped Mississippi farming.

The college is testing twenty different kinds of cotton to determine definitely which is best adapted to the different sections of the state. Its system of rotation and fertilization has increased the corn yield from 35 to 70 bushels an acre. Alfalfa fields planted at the college have yielded more than three tons of hay to the acre.

The cost of obtaining an education at Mississippi A. & M. is not high. One feature is that each student pays a small annual hospital fee. This entitles him to care and medical treatment at the university infirmary under the supervision of a resident physician and trained nurses. The students live in dormitories. No rental is charged for the rooms, but each student pays a small sum for steam heat, electric lights, laundry and maintenance of the dormitories.

Many boys work their way through the school. The extensive farm, herds and flocks that are maintained are looked after chiefly by the students. Special provisions in the way of night classes are made for those who work during the day. A number of graduates of the institution have won their sheepskins by working in the fields, barns or college buildings during the daytime and going to school at night.

Under the provisions of the Land Grant Act a military corps is established there. The president of the college is responsible for the government and management of the institution while the commandant, a regular army officer, has immediate control of the cadet corps.

# Chats with Office Callers

"The trouble with most people," said ***The Philosopher,*** "is that they have no time-tables in their lives. They don't know what they are going to do next summer or next year or fifteen years from now. Whether this is due to our having lost mastery of our own time, or because of an overexaggerated sense of the insecurity of life, doesn't matter—it's nonsense and worse. *You can do anything that is right if you want to,* in this world. And the chances are 99,999 in every 100,000 that what a person plans to do he or she can carry through if he or she wants to. It is surprising how few times one is stopped in the thing one really wants to do. It is when we are going nowhere in particular that things get tangled up for us. What are you going to build to next year and the next? What's your objective for the year 1941? When are you going to get your farm? When are you going to Europe? Make out a time-table of events and run on it. Until then, it will be powerless for words to make you realize the truth, which is, you can manage your life as you will."

ɣ ɣ ɣ

***The Doctor*** came into The Office. It had been rather a hard day and he stretched himself along two chairs. Picking up the evening paper, he said, "Well, here is something that would have been impossible ten years ago—President Coolidge goes to bed with a cold. Ten years ago he would have been laughed at, the doctor that advised it would have been harassed with ridicule. Yet the best thing one can do with a cold is to take it to bed. I was sorry when the President fell for that gas cure for colds. We don't hear about it so much nowadays, do we? But common sense is coming fast. When you can get people to go to bed for a cold, it shows big improvement. We used to talk about 'wearing out a cold'; but bed is the best place for such an ailment nowadays. Perhaps you know that Dr. William Osler, considered in his day the greatest general medical man, always went to bed when he took the 'snuffles,' as he called them. No medicine for him! He rested. That shows how far ahead of his time he was. But, judging from this piece in the paper, the times are catching up."

ɣ ɣ ɣ

"One does not get so far away from home when traveling around the world as one once did," said the ***Globe Trotter*** as he dropped into The Office on his way to the other side of the world. "The reason is that so much of America has followed the sun. There are five things I will guarantee to procure in almost any corner of the world that is not uninhabited desert—five American commodities that have become truly universal—and they are Horlick's malted milk, Singer sewing machines, Standard oil, Ford automobiles and Remington typewriters. I am not speaking only of the settled countries, but everywhere! Anywhere in China, Persia, India! The extent to which American goods are used by the more civilized nations, of course, is well enough known. That was a rather amusing incident, the discovery by English officials that all the 'copy' for the 'Buy British Goods' campaign was written on American typewriters, wasn't it? And then they found that the Prince of Wales and the Cabinet officers all used American typewriters! When the question was asked in Parliament of a Cabinet officer 'why the government used American typewriters,' the answer was 'to do typewriting.' Of course, the usefulness of our articles is one great cause of their abundant use abroad, but another is the salesmanship of our people. They go out and sell their goods. Many European countries produce articles which Americans would be glad to purchase in large quantities, but Europe will not send salesmen to America. You find a hundred salesmen crossing the Atlantic eastward to one coming westward. It would not injure our own business in the least, and it would help Europe immensely, if we were considered a promising market for the better sort of European products."

ɣ ɣ ɣ

"Let them take a vote," said ***The Man from New York.*** "Let them take a vote, and find out once and for all where the people stand with reference to prohibition. For a long time I was against such a plan. It seemed outrageous to me that the United States should pass a law and then take a vote on it. They take all the vote that is necessary when a law is passed. Are we to inaugurate in this country a double system—vote to make a law, and then vote whether it is to be enforced? What was most outrageous of all was that public officials who were sworn to enforce the law should suggest, upon taking office, that a referendum be taken to see whether the people wanted the law enforced! Twenty years from now the intellectual gymnastics accompanying wet propaganda will be uproariously funny to read.

"But, inconsistent, illogical and illegal as it all is, I say let them take a vote, for if there is anything certain it is that the prohibition amendment and the Volstead Act would be established in authority by such a public mandate as this country has never seen before. A vote would be the end of the wet propaganda for a hundred years. I know what I'm talking about. It was the men who patronized the saloons who voted the saloons out of business before. And it is the men who patronize blind-pigs who will vote more drastic treatment for them if these men are ever again called to the polls on that question. Dry sentiment was always in the majority in America, and it is stronger now than ever before. If the wets don't believe it, let them take a real vote of all the country. And that doesn't mean a straw vote in the newspapers, either.

ɣ ɣ ɣ

***The Man from Chicago*** was detailing some choice morsels from the criminal and political history of that city. "No murderer with from $40,000 to $60,000 need fear conviction there," he said; "that is about what it costs to be sure of your liberty.

"I am not in that class, but I had a little experience of my own which illustrates that legal processes are better known to the crook than to the honest man, and explains how the crook often slips through while the honest man bears the brunt. I was taken into court for speeding. I suppose I was going something like 32 miles an hour, which is not bad for Chicago. Just ahead of me in the court room was a man charged with driving while drunk. The officer explained that the man was so drunk that he (the officer) had to lift him from the car and lay him on a grassy lawn while his car was being extricated from its difficulty. And the man's appearance bore out the policeman's story. Two large aldermanic gentlemen then addressed the court in the culprit's behalf and the judge grunted, 'Five dollars and costs,' which meant about $7. I thought that was rather easy. It looked promising for me in my comparatively light offense. My case was called next and the judge read the charge—'The officer says you were going 35 miles an hour,' he said. 'Your Honor,' I said, 'I never dispute an officer's word. I probably was going a little faster than I should. If so, I am sorry. It is the first time.' Without looking up the judge said, 'Fifty dollars and costs.'

"That is the type of justice the ordinary citizen in court is likely to see, and it is not uplifting in its effect on the citizen's morale."

ɣ ɣ ɣ

***The Man from Africa*** brought curious and little-known tales of that continent. "The natives," said he, "though stupid in many respects, are hard bargain drivers. They eat so much meat that salt is to them what candy is to us. They eat it in handfuls; and in certain parts hard salt is used for money. As they dicker, the money-holder takes frequent licks from his often dirty coinage, and never lets go until his purchase is safely in one hand. In time, of course, this currency actually disappears.

"Their food is largely meat, which they often eat raw. It makes no difference to them how the animal died. For example, the natives often raise chickens to sell to white men. The poor chickens are fed as little as possible to keep life, and when white men purchase them and give them an abundance of food, they often die from overeating. I had had this experience, and of course threw away the dead chickens. Immediately a native begged permission to take the birds. The explanation that they had died a natural death fell on deaf ears. The native simply came back with the retort that his chicken was no more dead than the one just beheaded by the cook.

"Another instance of similar reasoning: a native was commanded to put water in the radiator and gas in the tank of the auto. He reversed the order. To him a liquid was a liquid—for a'that.

"African graves are frequently decorated lavishly with liquor bottles. Such decorations are much coveted and are a supreme honor to the dead—for are they not the sign of civilization in Africa?"

# There Is Nothing New Under the Sea

## How Robert Fulton Demonstrated Submarines Over a Hundred Years Ago

By A. J. MONTGOMERY

ROBERT FULTON is acclaimed by the world as the man who applied steam to navigation and revolutionized trade and commerce; but how many know that this same genius actually designed and constructed a submarine and spent hours in her under the sea years before the *Clermont* made her first epochal voyage from New York to Albany?

Many persons think the submarine a modern engine of war, something very new and generally associated with the shock of the *Lusitania* and the World War. And yet the fact is that as early as 1801 Robert Fulton had demonstrated the practicability of under-sea craft and had outlined the uses to which they would be put with an accuracy more than prophetic.

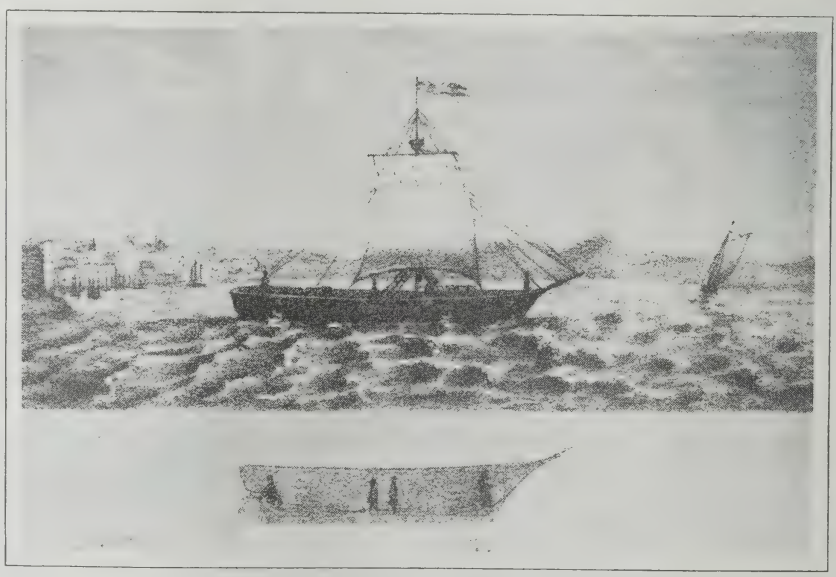
The absorbing story of a submarine which folded her sails and plunged under sea, of a bomb for under-sea explosion, which had the prime characteristics of a torpedo, is told for the first time in a manuscript in the handwriting of Fulton which came recently into the possession of the Library of Congress. It belonged to his daughter, Cornelia Livingston Crary, and is accompanied by an affidavit that attests its authenticity. The actual plans and designs of this first under-sea monster have been placed for safekeeping with the New Jersey Historical Society.

In perusing this manuscript the first thing that arrests the reader is the length of time—almost one hundred years—it took the world to catch up with genius. Perhaps it is accounted for by the reflection Fulton made at the conclusion of his manuscript and after France, Great Britain, and the United States had refused to take up his invention or to give him the aid necessary to put it into practical effect.

"Vulgar men," he said, "see only what is before their eyes. Men of science and of sense penetrate from principles to future and certain effects."

It is interesting to note that among the men whose aid Fulton sought were Napoleon Bonaparte, First Consul of France; William Pitt, Prime Minister of England; and Thomas Jefferson, President of the United States.

But to return to the manuscript. At the time when he dreamed of a "plunging boat," as he first called it, Fulton was living in Paris. He had spent several years in experiments and tests to establish to his own satisfaction that from the point of view of physics the construction of a submarine was feasible and practicable. He stated his scientific thesis under the following two heads:



"First, to navigate under water, which I soon discovered was within the limits of physics.

"Second, to find an easy mode of destroying a ship, which after some time I discovered might be done by the explosion of some pounds of gunpowder under her bottom.

"I made drawings and calculations," he continued, "and after two years was so well satisfied with my success and convinced that everything I contemplated might be performed that I wrote the Earl of Stanhope and gave him general ideas of my plans and experiments. His Lordship's mathematical mind soon opened to him the practicability and ultimate consequence of such a system. He felt alarmed and as we all know spoke of it in the House of Lords, which excited much public curiosity."

It was on July 3, 1801, that Fulton with three companions sailed his boat into the harbor of Brest and made the first plunge under the sea. He descended to five, ten, fifteen, and then to twenty-five feet. His boat had suffered from exposure and he was afraid she could not stand greater pressure. He remained below the surface one hour. Afterward he descended with candles but found that they consumed too much vital air. Before his next experiment he had made in the bow of the boat a small window of thick glass which gave him sufficient light for observation purposes in subsequent dives.

By July 26 he was ready for further experiments, having in the interval greatly improved the machinery for propelling her under water and the lever for keeping the vessel steady at the desired depth. He had christened his strange craft the *Nautilus* and referred to her as a submarine, discarding the name "plunging boat."

Robert Fulton's submarine, the *Nautilus*, which he at first called a "plunging boat."

Out into the harbor of Brest sailed the *Nautilus* carrying one mast, a mainsail, and a jib as jauntily as any fishing craft in these waters. After demonstrating that she could sail as well as any ordinary surface boat he struck her mast and sails. To do this and to get her ready to submerge required only two minutes.

After reaching a depth of fifteen feet he placed two men at the engine designed to propel her under water, one man at the helm, while he himself with the aid of a barometer and a lever kept her balanced between the upper and lower waters. He found that he needed only the use of one hand to keep her at any level he pleased. He started the engine and on coming to the surface found that he had traveled 500 yards. This experiment was repeated several days in succession until he became familiar with the operation of the engine and the movement of the boat. He satisfied himself that she was thoroughly obedient to her helm and that the magnetic needle held true.

There remained to be worked out the vital question of air supply. In less than two weeks Fulton had designed and constructed a copper globe of a cubic foot capacity. Into the globe he put two hundred atmospheres of compressed air, with provision to regulate the withdrawal of air from this reservoir as became necessary. It enabled Fulton and his companions in this Jules Verne episode to remain under water four hours and twenty minutes without feeling any inconveniences.

Satisfied with his experiments, Fulton proceeded to design a larger boat embodying improved features as to balances, underwater propulsion, compressed air, and lever control. When the plans were complete he offered to turn them over to the British Government for a period of fourteen years for the sum of one hundred thousand pounds. As outlined in the proposal to Great Britain, Fulton's vessel was to have the following properties:

"First, that a submarine vessel 30 feet long, 10 feet wide and 8 feet deep capable of containing six persons shall have the property of sailing like an ordinary fishing boat.

"Second, that her capacity, including her machinery, shall be sufficient to contain provisions for six persons to continue at sea for twenty days.

"Third, the six persons can enter such a vessel and plunge her under sea at pleasure.

"Fourth, that they can continue under water for three hours without renewing the air."

Provision was made in these plans for two tubes bearing a resemblance to a periscope, one for the intake of fresh air and one to let the foul air out. These were so placed and designed that the boat itself need not appear on the surface but could remain semi-submerged while the air compressors were replenished. This process could be accomplished in two minutes. In addition, she was capable of carrying twenty submarine bombs, each containing 200 pounds of powder.

It is a curious fact that it was in the effort to find an effective method of applying such bombs that Fulton groped toward the idea of a submarine vessel.

The British Government hesitated to accept the Fulton proposal but sent him an emissary with 800 guineas to pay his expenses to London for a series of conferences. The result was that in lieu of the 100,000 pounds Prime Minister Pitt offered him a retainer of 200 pounds a month and a royalty amounting to one-half the value of all the enemy ships destroyed by means of his invention.

Then a curious thing happened. A board of officers was appointed to make a report on the adoption of the patents. Naval jealousies of anything new prevailed and the board refused to sponsor his invention or to give him facilities to test it.

His manuscript with his own account of the discussions clearly discloses that at the bottom of Great Britain's refusal to accept the proposals was the fear that the smaller nations of Europe could use the invention sooner or later to challenge British Naval supremacy which at this time was thoroughly established.

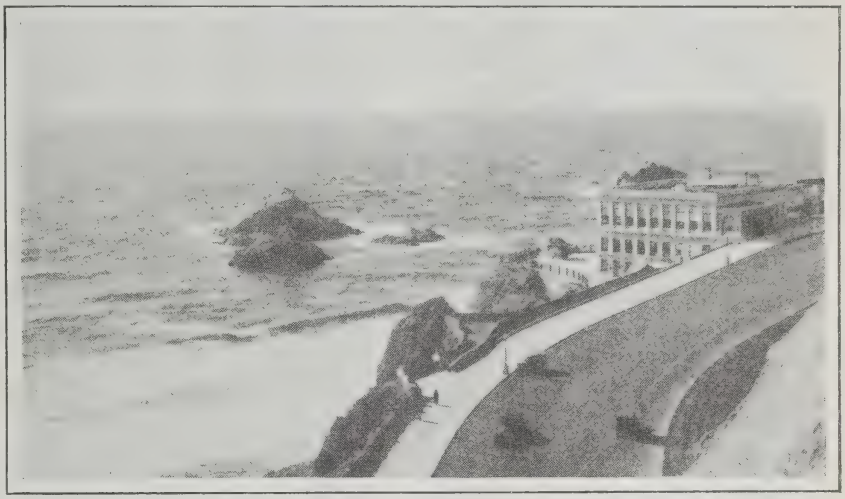
"She is contrived," reads the manuscript, "to hide under the water where she may continue the whole day and approach the fleets and harbors of the enemy in the night, there anchor her cargo of submarine bombs under water or leave them to the tide or use them any other way which time and practice may point out and retire unperceived for another cargo and deposit it in like manner, in the mouths of rivers, in harbors or among the fleets at anchor, and thus place such numbers as would render it impossible to move through where the bombs were without the greatest danger of being blown up and totally destroyed.

"For putting the Government in full possession of all the combinations of the submarine vessel so that any engineer of good talent can make and navigate it, also for developing the combinations and explaining the modes of attack with them which experience will multiply and perfect, I require the sum of 100,000 pounds."

Such was the premium on one of the greatest naval inventions ever produced.

Aside from the account of the inventions one is amazed at the extraordinary sagacity that Fulton displayed as a naval strategist.

Warning the British Government of what might happen should France be in a position to convert the cost of her flotilla of battleships into submarines and bombs of instantaneous combustion, Fulton said:

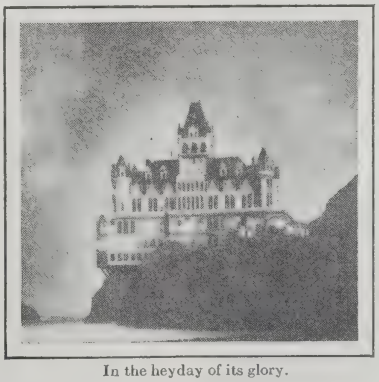


"The Boulogne Flotilla has cost the French Government more than two billions of sterling for which 100,000 instantaneous bombs might have been made. With such a magazine at Boulogne or Calais and 100 good boats the enemy might each dark night throw some hundreds of bombs in the channels of the Thames, in the Downs, or along the coast, to the total destruction of British commerce and if her commerce is destroyed, what is the use of her marine?"

What is this but the essence of naval policy and naval strategy today?

# When Cliff House Went Really Dry

## Once Famous San Francisco Resort Sees Changed Days

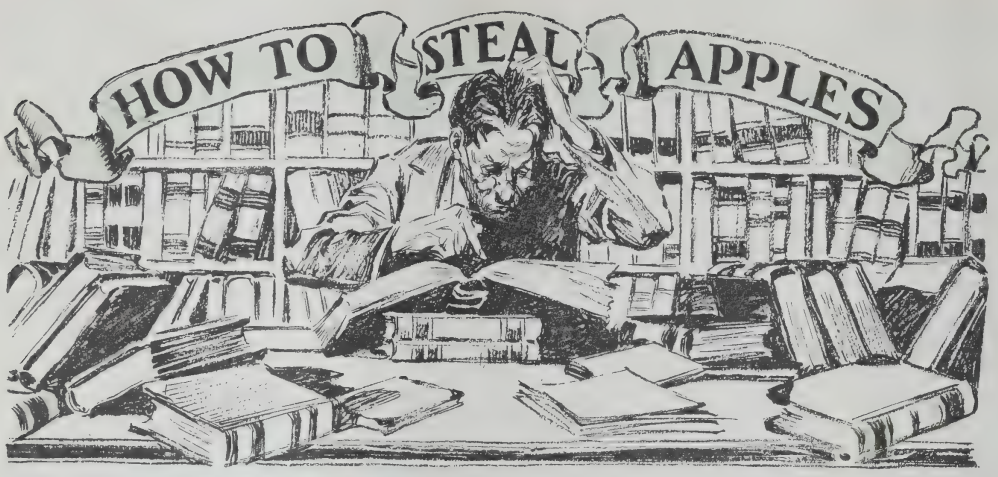


By HARRY H. DUNN

San Francisco's famous Cliff House as it is at present.

FOUR times destroyed by fire and rebuilt to greater glory each time, the Cliff House, looking out over the Pacific from the southern shore of the entrance to the Golden Gate, at last has succumbed to the Great Drouth. Once the center of the social life of San Francisco, famous as the most celebrated gathering place for *bon vivants* and epicureans on the Pacific Coast, it is closed against all comers. At least five generations of Californians, with a sprinkling of Middle-Westerners—who for one wild night were willing to pay more than fifty cents for a meal—have enjoyed the food prepared here by the most noted chefs of the Western World.

When prohibition became the law of the land, the Cliff House went really dry. For a time an attempt was made to "carry on" with the wonderful assortment of foods, marvelously prepared, which had made this resort known to gourmets all around the world. But it was soon found that the people who knew and appreciated good food would not dine where they could not have wine. The others merely ate to fill their stomachs, and for them the varied foods of the Cliff House were not prepared.



In the heyday of its glory.

Thus, the culinary standards of the beautiful house "built upon a rock" were maintained as long as possible. Then the building was turned over to one who for years had been the manager of the home of food and fun. He converted it into a coffee shop, and precariously maintained it on such plebeian foods as ham and eggs, hotcakes, coffee and sinkers—but, late in October, 1925, he began to realize that greatness cannot live on tradition. He had shocked the sensibilities of the epicureans of San Francisco—which, with New Orleans, shares the honor of being America's last gustatorial frontier—when he converted the center of western social life into a quick-lunch counter. Ham and eggs were not suitable successors to caviar, and coffee could not replace the Burgundies of long ago.

In the old days no distinguished visitor ever set foot within the "city that knows how" without including the Cliff House in his itinerary of entertainment. In those days, the pop of corks kept staccato time to the Wagnerian interludes played by the sea on the rocks below. Today, the passing of the Cliff House marks what may be the first step in the descent of San Francisco to the level of Los Angeles, the only city in the world where meals are eaten out of paper bags, and the art of dining has passed to join that of leisurely living.

According to the present owner, there will be no more coffee shops in the old Cliff House. Some day it may be restored to the center of the social life of gentlewomen and gentlemen—but that hope seems poorly founded, that time far distant, unless the Cliff House be removed to some one of the Spanish-American republics, where the art of living is still one of the prime factors in the business of life.

# Loopholes of Law Which Enable Fruit Marauders to Defy Mantraps, Spring Guns, and the Farmer's Bulldog

By JOHN BARKER WAITE

ILLUSTRATED BY J. C. GRAHAM

LAW always lags a bit behind changes in social arrangements. It accepts ideas only after people have tested them and found them good; which is quite desirable if law is to serve as a social stabilizer. But this occasional difference between legal theories and social realities produces some peculiar situations, until adjustment takes place.

Consider, for instance, the stealing of apples.

Robert White owned a farm. His orchard was a joy to behold and a temptation to which many passing automobilists succumbed. The only fence White could reasonably afford was not difficult to get over, especially if one did not care how he damaged the fence. Indeed, automobile pliers would cut right through it. Most of the people who appropriated an apple or two, or a hatful, really thought that White would not mind, or at least that he would never miss the fruit. And he probably would not have felt the loss of what one man took, or two men, or three. But a hundred hatfuls of apples mean real money to a farmer. And a hundred trespassers climbing fences and breaking branches mean much more than the value of the fruit in damage done.

How to stop it was a real problem for White. Something drastic must be done; it was a question only of ways and means.

A few bear traps well inside the fence and a large notice to that effect would stop the loss. So would a truthful warning against spring guns, or the presence of a couple of vicious dogs. No one could be hurt except trespassers, duly notified to keep out.

The objection is, however, that a trespasser or even a downright thief is not an outlaw. A householder has no legal right to shoot a burglar merely because he is a burglar. Spring guns, traps, or even vicious dogs might bring upon White a flood of damage suits which would cost him the value of many years of apples. Indeed, the legislature has made the use of spring guns, though loaded only with rock salt, criminal. And anything else that is unconventional is quite as dangerous to the pocketbook of the landowner as to the body of a trespasser.

The precise application of the law in such cases is still uncertain because they do not often arise. As a general thing, many courts hold that one whose unlawful act has been the immediate cause of his injury cannot recover damages from one whose previous act caused a dangerous situation. This would indicate that a thief whose unlawful trespass caused him to set off a spring gun could not sue the landowner who set the gun. But all courts agree that an owner must pay damages even to a trespasser if he uses more force than necessary to eject the trespasser.

As no lawyer could give White more definite advice, he concluded to play safe and to rely on enforcing the criminal law against thieves.

But he had to catch a hare before he could jug it. An apple thief would have to be arrested before he could be prosecuted. Merely scaring off occasional trespassers would be useless as a protection, because it would have no effect on others. If thieves could not be kept out by fear of immediate injury they must be kept out through fear of the law. White's idea was to catch a thief red-handed and have him arrested and punished at once, with as much publicity as possible, as an example of what might happen to any thief. An excellent *theory*.

Merely to get a trespasser's auto license number and later have him arrested would be too slow, too complicated and too costly; especially if the thief were a citizen of another state, White would then have first to ascertain from that state to whom the license belonged. Then it would be necessary for him to go in person to some magistrate and swear to a complaint. But no prosecution could be started in Ohio, for instance, for a theft committed in Michigan. One state does not attempt to punish for crimes committed in another.

Even were the license a local one the matter would be impossibly complex. To learn the name of the person to whom it was issued might not take long. But what certainty would there be that the licensee of the car was the man who stole the apples? It might have been a rented car, or a borrowed one, or the owner's companion might have taken the fruit while the owner did nothing. It would never do for White to swear out a warrant for the arrest of a man who was innocent. The only safe thing would be for White to go wherever the car came from and investigate the real identity of the thief—if he could identify him—and then swear out the warrant—a matter of money, time, and energy that few men can afford to spend. And again the force of example would be wasted by delay.

The only practical method for White to protect himself was obviously to arrest some culprit right in the act and to push the prosecution vigorously.

This was the point to which matters had come when Joe Urbanski appeared on the scene. Joe was a shrewd and crooked soul, with a constant eye to the main chance. As a business, he supplied hucksters with fruit and vegetables which he gathered up in the country. It was a profitable custom of his, since his legitimately purchased stuff made a good screen in case of trouble, to appropriate what unpaid-for fruit opportunity might offer. Because he was careless of fences and knew the habits of

farmers, he found opportunity frequently, and his disreputable looking truck seldom carried an entirely lawful load. But he made the inevitable mistake of the crook when he tackled the White apples, because he did not know that desperation had driven White to keep watch.

He got considerable fruit before White saw him.

"Sure," he said, "I picked up a few from the ground, what I supposed was only going to rot. I'll put them back if you want." But White had seen him picking from the trees, and in the truck was evidence that he had gathered more than a few which had no sign of ground bruise. Merely to get them back would not serve White's purpose. Events happened fast, but in the main were afterward undisputed. White announced his intention of arresting Urbanski for the theft and started toward him. Urbanski drew a knife with which to defend himself from arrest. White picked up a club with which he broke Urbanski's knife hand, and the latter ran around his truck with the idea of getting in and away. The appearance of a motor policeman brought both actors to a halt.

*Urbanski and the Law's Loopholes*

White at once complained to the policeman and the latter put Urbanski under arrest for theft. Joe protested, but made no resistance, and it looked as though one common thief were scheduled to travel the road which the law lays out for thieves. He was duly taken before a magistrate; White left his work and swore to the complaint in person, as the law requires, and all was set for a trial.

But Urbanski fell into capable hands when he picked a lawyer to defend him—capable, that is, from Urbanski's point of view.

At his attorney's request the prosecution of the criminal case against Urbanski was delayed and before any progress had been made Urbanski had set up a counter offensive by starting suits against both White and the policeman who made the arrest.

Against White he charged assault and battery and asked $10,000 as compensation for White's attack on him and the injury to his hand. From the officer he demanded damages caused by an unlawful arrest.

When the criminal case of the People against Joe Urbanski, charged with larceny, came on for trial, Urbanski refused to plead to the arraignment and his attorney moved the court to dismiss the proceedings entirely and to discharge the defendant, on the ground that he had been illegally arrested and the court had no power whatsoever to put him on trial.

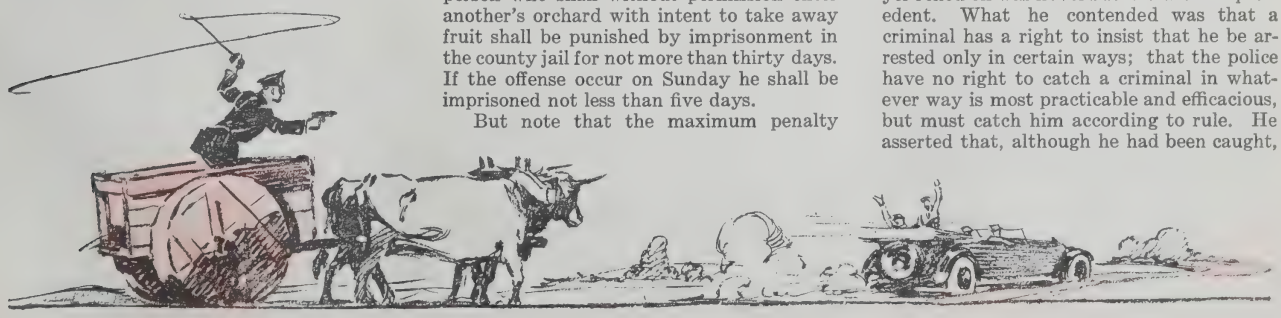
White's "practical" solution of the apple problem was not working so smoothly as might have been expected. Already he was beginning to wish he had never owned an orchard. Assuming that Urbanski's suit for damages was only blackmail and could not possibly succeed, White dared not let it go by default; he felt obliged to hire a lawyer, and it would not take much of a lawyer's time to eat up a whole orchard full of apples.

Moreover, there was no certainty that Urbanski would not be successful in his suit, both against White and against the officer. In fact there seemed no reason why Urbanski should not win; no reason why White should not have a big bill of damages to pay for his attempt to protect his orchard. His own attorney was emphatic in saying that his attempt to arrest Urbanski was an unlawful assault for which he would be liable, unless he had a legal right to make the arrest. Likewise, if the arrest were illegal, Urbanski had the right to use a knife if necessary to protect his liberty, and White's damage to his hand would have to be paid. The officer too was liable in damages if he had not authority to make the arrest. Within the past few months a Wisconsin jury had decided that a chief of police ought to pay $1,000 for having arrested a man outside of his own jurisdiction, and the Supreme Court held that the officer's good faith was no defense.

And neither White nor the officer apparently had any right whatever to make the arrest. Urbanski was sitting pretty as a result of his own wrongdoing.

Taking apples from a tree was not a crime at common law, that is to say, by the law of judicial precedent. Apples on the tree are real estate. And unlawfully taking real estate is in general not even now criminal. At common law Urbanski's act was a trespass, and as such unlawful, and White could have sued him for whatever actual damage resulted therefrom, but it was not a crime. Hence in the absence of legislation, neither White nor the officer nor anyone else had authority to arrest him. Just why trespass is not a crime is a matter of history. It was a sound enough rule originally and if it is no longer wise, the legislature has power to change it.

As to apples the legislature has changed it. The statute reads, in effect, that every person who shall without permission enter another's orchard with intent to take away fruit shall be punished by imprisonment in the county jail for not more than thirty days. If the offense occur on Sunday he shall be imprisoned not less than five days.



But note that the maximum penalty which can be imposed is only thirty days in the county jail. The offense, therefore, is only a "misdemeanor," not a "felony." Felonies are those crimes which are punishable by death or imprisonment in the state penitentiary. Offenses which carry a lighter penalty are but misdemeanors.

The difference is vitally important in respect to the right of arrest. Anyone may arrest a felon on sight, whether he saw the felony committed or not; a warrant for the arrest is not necessary. The delay caused by getting a warrant would be too serious. But not so as to misdemeanors. So fearful are we of our individual liberties, so distrustful of the officials whom we choose by our own votes, that we stick to the old law requiring even an officer to show a warrant before he arrests for a misdemeanor, except in cases of breach of the peace. Conditions are different, but we have carefully kept the law the same. Officer or citizen making an arrest for a misdemeanor must be armed with a warrant, issued by a magistrate, naming or otherwise describing the person to be arrested.

No statute, however, gave either White or the officer any authority to arrest Urbanski for violation of this law against stealing apples. Since it was the statute only which made his act criminal, their power to arrest was limited by the statute, which gave no power.

All White had any right to do was to hurry in person to the nearest magistrate and ask for a warrant for Urbanski's arrest. The officer could not have done even that much. He could not have himself secured a warrant because he could not swear to personal knowledge of the facts. Only White could do that, though when the warrant had been duly issued the officer could have made the arrest by virtue of its authority—if Urbanski had been still within his jurisdiction.

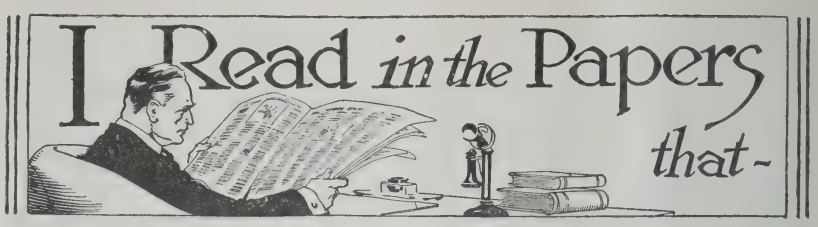
Not only did Urbanski have White and the officer at his mercy, he was well set also to compel dismissal of the criminal charge against himself. The point his lawyer relied on was novel but not without precedent. What he contended was that a criminal has a right to insist that he be arrested only in certain ways; that the police have no right to catch a criminal in whatever way is most practicable and efficacious, but must catch him according to rule. He asserted that, although he had been caught,

he had not been properly caught and therefore could not be held. He had judicial sanction for his proposition.

But as things looked blackest for the Public, and for White in particular, Urbanski's hopes collapsed. Someone remembered his admission that he had taken *fallen* apples.

Now apples when severed from the tree cease to be real estate and are personal property even though lying on the ground. And at common law the theft of personal property such as apples was larceny, a felony. To be sure, larceny in this country is no longer punished by death nor even by imprisonment in the penitentiary if the value of the goods taken be less than $25. As what Urbanski had picked up was probably much less than that in value, his larceny was only a misdemeanor when considered in terms of punishment. But our courts have held, for some reason, that because all larceny was a felony at common law, it is still a felony so far as the right to arrest is concerned. For a felony one has the right to arrest without a warrant.

For stealing apples from the tree Urbanski could not be lawfully arrested without a warrant. For taking them from the ground he could be. Because he took fallen apples his cases against White and the officer broke down. Because he took fallen apples they could lawfully arrest him without warrant. Because White had the right to arrest him, Urbanski had no right to resist, and White's necessary use of the club was justified. The officer's arrest being for the common law felony of stealing fallen apples, instead of for the statutory crime of taking growing fruit, was lawful. Therefore the court had power to continue prosecution of Urbanski. All was well from the standpoint of public good. As the case turned out, Urbanski was likely to go to jail—unless he could get so many postponements that White would tire of coming to court to give his evidence—and White was safe, though not over happy about the prospect of protecting his orchard in future.



## Literary Fakers and Their Fakes

(*Concluded from page 13*)

the consternation among the spectric folk was like that among the spiritualists when Eusapia Palladino was exposed, and Lombroso and his fellow scientist were shown to be very gullible gentlemen. Or it was like the hurrying and scurrying to cover of the sun-myth adherents when Whatley ridiculed the cult in 1819, with his brilliant historic doubts concerning Napoleon Bonaparte.

However, those who had charge of the public trumpets did not blazon and blast very lustily, and the hoax was soon forgotten, the quicker because of the World War. Indeed, it would seem that at least one anthology maker to this day is not aware of the fake character of the Morgan-Knish *Spectra* poems. At any rate, without a word of explanation he includes them among others designed to reveal the healthy "protest against the sentimentality, the chauvinism, and the blind reverence for institutions characteristic of the Victorian age."

The words are those of the editor himself, written apparently in glorious ignorance of the fact that his own reverence in at least two cases is directed toward a confessed hoax.

Herman Klingelhutz, of Minneapolis, filed suit for $10,000 damages against a vaudeville theater and an actress. He contended that the term "butter and egg man" is an insult to Minnesota and to butter and egg dealers in general. He charged that he "suffered in his reputation in that his morale, integrity, character and intelligence have been assailed and ridiculed." He said that he was acting as a representative for about 18 butter and egg dealers of Minneapolis. The complaint against the actress charges that in a song entitled "Butter and Eggs" she used "certain tones and gestures to convey that all dealers in butter and eggs were men of immoral and licentious character and thereby hold plaintiff and others similarly situated to hatred, contempt and ridicule."

---

Washburn, in the Boston *Transcript*, gives the picture of "high life" in Washington:

Recently an officer near the top of the enforcement department satirized the situation to a group who chortled their satisfaction and merriment. Why name him, for it should be principles first and persons last? He is an ardent participant in wet dinners. He told his hearers how to make their booze and where to buy it. He said: "I do not believe in sumptuary legislation," and that "the best way to repeal a bad law is not to enforce it." When one of his damp listeners hurried up with his congratulations, he concluded: "Well, we've had a hell of a good time, anyway." Pending which, some folks from the backwoods wonder why the law is not enforced. Many intellectual aristocrats say it cannot be enforced. It will not be enforced until sincere drys only are charged with the duty of enforcement. One-legged men do not go into track athletics, swimming teachers are not hired as gardeners, hyenas as attendants in day nurseries, neither does a church which sets out to save souls call an agnostic to the pulpit. No, Mr. Upshaw, in the words of Mr. Gardner: "You cannot always be wrong, this time you are right."

---

Monsignor Cassidy, of the Catholic Church at Fall River, Massachusetts, says:

"I shall stand as firm against the saloon as others are standing for it, and as a citizen of this great Republic, I claim the right to fight as hard in the maintenance of the Constitution as others are fighting for its alteration and dissolution. Intoxicating liquors are not an essential, and they are an evil. Others of my cloth and kind may tell you otherwise. I want you to know that as yet there is nothing in the Church's teachings or traditions or interpretation of Holy Scriptures—nothing to prevent you from standing for prohibition."

---

an Associated Press dispatch printed broadcast over the country reads, "Jews say President Coolidge Made Them More Popular."

President Coolidge was termed a principal factor in the improvement of popular regard for Jews in the annual report of the American Jewish Committee, made public yesterday by Louis Marshall, president of the organization.

The committee was organized 20 years ago to safeguard the rights of the Jews and protect them against discrimination. Its membership consists of 14 national Jewish organizations.

The report asserted that it was gratifying to note that the President has "utterly demolished some of the most cherished of the pet notions of Ku Kluxism and Nordicism." The report referred to his address at the cornerstone laying of the National Jewish Center at Washington, and the American Legion convention at Omaha.

---

in Great Britain an attempt is to be made to restore the ancient traditions of the silversmith's craft, and to revive fine handwrought work in the precious metals in face of the opposing flood of machine-made wares.

So pressing has been the competition of spun and machine-produced work in gold and silver that the craftsman whose art reached its zenith in the magnificent creations of the sixteenth and seventeenth centuries has been crushed almost out of existence.

To prevent the craftsman from becoming quite extinct, the Goldsmiths' Company is inviting all interested in design in precious metals to submit drawings of specified articles of domestic plate—trays, coffee and tea sets, cigar boxes, and the like—to a committee of judges.

This competition also is meant to give a new stimulus to craftsmanship and to encourage the public to demand finer wares from the gold and silver workers. It may result in dispelling the stagnation at present overhanging the trade, lead to other competitions being organized, and result in that coöperation between retailers and artist-designers which has already been so satisfactorily established in other countries.

The competitors must be British, and their designs will be judged by the same committee that will examine the drawings for domestic plate. The Goldsmiths' Company will be glad to receive suggestions which may help on their ideals.

# Woodrow Wilson—Taker of Chances

(*Continued from page 7*)

those whose manners and appearance are similar to their own and pleasing to themselves. This tendency unfits men for life in a democracy, where one must often work at a desk next to a man who spits all over his own shoes."

Despite President Wilson's views in regard to the bequest, a majority of the faculty and trustees favored acceptance. Nevertheless, Mr. Wilson did not hesitate an instant. He recommended rejection of the $500,000—an unheard-of thing among American colleges. He put it squarely up to the trustees that acceptance of the bequest meant his resignation as president of the university. And he won. The money was declined.

But fate had another test in store for Woodrow Wilson. A little later an alumnus of Princeton died, and when his will was probated it was found to contain a bequest of about $3,000,000 to Princeton University. The will stipulated that the money should be used for a graduate college separated from the main university—exactly what Mr. Wilson opposed. Again he made "one heap of all his winnings," but this time it looked as if he had lost. The board of trustees accepted the bequest in the face of Mr. Wilson's objections, and thereby made him Governor of New Jersey, which resulted in his election to the Presidency. If the trustees had declined the bequest, Mr. Wilson would have remained at Princeton and probably never have been President. He felt at the time the bequest was accepted that he had been "kicked out." If so, he was "kicked out" and up, and was again the winner as the result of his gamble.

President Wilson's study in his home at Princeton, New Jersey.

### *Wilson Takes a Hand at Newark*

A few years later, as Governor of New Jersey, with talk of the Presidency flying about his head, he again made one heap of all his winnings, and risked it on one turn of pitch and toss. The gamble was over the election of a United States Senator. For years "Jim" Smith, of Newark, former Senator and Democratic boss of the state, had aspired to go back to Washington, where, fifteen years before, Mr. Wilson believed he had misrepresented his state and his party. When Mr. Wilson accepted the Democratic nomination for Governor he had stipulated that he would not consent to Smith's election to the Senate. Furthermore, in the primaries of that year the New Jersey Democrats had endorsed James Martine for Senator.

When it was found that the Democrats had a majority of the legislature on joint ballot, Smith went after the plum. That was before Senators were elected by direct vote of the people. Public opinion, therefore, could only make itself felt by its pressure on the members of the legislature, who chose the Senators. Nevertheless, Governor Wilson put all his eggs in one basket and went to the political market. He took the stump against Smith's election, opening his campaign in Newark, Smith's home town. If the legislature went ahead and elected Smith, Wilson's influence as Governor and as leader of his party would be at an end, together with any presidential possibilities that might be in the offing. But he won. He aroused such a storm of protest against Smith's choice and such a strong demand for the election of the man endorsed in the primaries that Smith retired from the stage and was never heard from again. The incident instantly lifted Mr. Wilson to greater power and made him a national figure.

At about the same time another dramatic gamble was taken by the new Governor. Once more he made one heap of all his winnings. The Democratic members of the legislature assembled for a conference to make up the legislative program of the session beginning simultaneously with Mr. Wilson's term as Governor. To their surprise they found Mr. Wilson present. They were embarrassed. Here was something unprecedented. The passing of laws was the business of the legislators. The Governor was supposed to recommend legislation but throughout the history of the state he had stopped at that. The determination of the Governor's recommendations was exclusively the business of the legislative department, it was believed.

After a few minutes of indecision, one legislator objected to the Governor's presence at the conference. Discussion of the right and propriety of his participation was started. Mr. Wilson got to his feet, smiled amiably and began an explanation of his presence, without asking permission to do so and on the assumption that he was welcome.

"I have been made the leader of the Democratic party in New Jersey and the spokesman of the people of the state," he said, "and it is therefore proper that I should exercise leadership (if I am qualified to do so) in the determination of the Democratic program. You gentlemen are not responsible to the state at large, as I am. You are each responsible to a small legislative district. I am the only officer of the state for whom the whole state votes. I therefore not only represent the whole state but I am the person who will be held responsible by the state for what is done. If our legislative program is not right, I, rather than you, will be called to account." Mr. Wilson expounded his now famous theory of the responsibility of the executive, obtained its approval by the Democratic members of the legislature, and then brought from his pocket a memorandum of the laws which he believed should be passed. One was a direct primary law. One was a workingmen's compensation act. Another was a corrupt practices act. A third was an act giving cities power to adopt commission form of government. Others were "anti-trust" acts.

There was vigorous opposition in the state to every reform. Some of it was reflected in the Democratic conference. Numerous members raised objections. Mr. Wilson, however, "made one heap" of the whole program, stood on his feet before the conference for three hours and a half, explaining, debating, arguing, and appealing to his associates and, in the end, obtained the pledge of the members to put every measure through. The pledges were kept and the bills were passed. Defeat would have put an end to Mr. Wilson's political career. Again he gambled on the chance of winning, when nine out of ten other governors would have "played safe," as they supposed, by not risking their influence over the legislature.

### *Pledges Were Kept and Bills Passed*

How completely Woodrow Wilson could suppress thought of himself, when his conscience demanded that he act, was illustrated in an incident that occurred several days before the Baltimore convention which nominated him for the Presidency.

It so happened that at the time in question, I was passing through the Pennsylvania depot in New York City with a friend on my way to a train going west. My friend, looking into the restaurant, observed

Woodrow Wilson and Dudley Field Malone sitting up at the lunch counter. We joined them there and learned that they were to be on the same train with us for a few miles, and when I inquired where they were going, the Governor said, with a laugh:

"Well isn't it the irony of fate that here on the very eve of the convention at Baltimore, a strike has occurred in one of our large industrial plants and I am compelled to go down to the plant and attempt to settle it!"

"But," I inquired, "why *must* you do this at this time? Suppose you fail or something serious or unforeseen occurs while you are there? Will it not jeopardize your interests in Baltimore? Is it necessary for you, as Governor, on your own initiative to intervene in this strike, under such circumstances?"

***Settling a Strike at Short Notice***

But he replied with some seriousness:

"If this strike is permitted to go on, it may break out into a conflagration that will result in loss of life. As Governor I feel it my duty to exercise all of my power and ingenuity to stop it, regardless of the consequences to me."

As we bade him goodby, he seemed in an unusually cheerful frame of mind, having regaled us with humorous stories during the entire trip and apparently not at all fearful of the chances he was taking.

On the following day it was announced through the press that the strike had been settled through his efforts.

Another dramatic crisis in his career arose over the Panama Canal tolls question. It was almost the first thing he had to face after he became President. Carried away by the plausibility of the phrase, "Free tolls for American ships," a previous Congress had passed an act, regulating tolls to be charged for the use of the canal, but stipulating that ships of American registry should pass through free. Congress, a lot of newspapers, and a number of so-called political leaders hugged themselves joyfully in the idea that they had benefited American shipping interests and American traders by giving them an advantage not enjoyed by their foreign rivals. The Democratic National Convention that nominated Mr. Wilson had been carried away by the same jingoism and had inserted a free tolls plank in the 1912 platform, on which Mr. Wilson had been elected

The fact remained, however, that the act violated our treaty obligations to Great Britain, who, years before, had surrendered unquestioned prior rights on the Isthmus on the condition that, if the United States dug the canal, it should be open to the ships of all nations on terms of equality. Mr. Wilson always held a very high regard for treaty obligation, so he demanded repeal of the free tolls act, despite the Democratic platform.

***When Wilson Was on the Panama Canal Act***

It was the first test of his leadership, and a host of members and interests who had opposed his selection as President got busy to try to beat him. He made one heap of all his winnings and declared that he would follow the practice observed in Europe where, if the government is defeated in Parliament, it resigns. But again the "one turn of pitch and toss" was in his favor. He won by a big majority and became, therefore, stronger than ever.

Many of the chances which Mr. Wilson took involved not only moral but physical courage. It was one of the latter kind that occurred on May 12, 1914, on the occasion of the landing in New York City of the bodies of the sailors and marines killed at Vera Cruz.

The times were unsettled. Many cranks were abroad, and the secret service men were anxious about the President's public appearances. Just a short time before, an attempt had been made to assassinate Mayor Mitchell, of New York.

When the plans were submitted to the President by Mr. Tumulty in the former's office, there were present some of the secret service men and Mr. Fitz-Woodrow, a cousin of the President. No provision had been made for Mr. Wilson to accompany the *cortege*. It had been planned to have the bodies disembarked from the ship at the Battery, from which place the procession would start. Thence it was to proceed to the City Hall, where Mayor Mitchell was to make a short address. He would join the President at that point and they would proceed across the bridge to the Marine Barracks at the Brooklyn Navy Yard.

Under ordinary circumstances Mr. Wilson heartily disliked to take part in parades. In campaign times it was difficult, if not impossible, to get him to do so. But the funeral procession was a different thing. He was the commander-in-chief of those dead boys. They had gone to Vera Cruz at his command and he was stricken with grief over their loss. Having risked their lives for their country, who was he that he should not stand by them in death, he argued.

Mr. Tumulty and the others present appealed to him not to expose himself. They told him that he would be an easy mark for any sharpshooter from any of the buildings along the line of the procession, or would be easily reached by a bomb. The President listened to them quietly until they had finished. Then he arose and said:

***Taking Part in a New York Procession***

"I am going to New York and I am going to ride in that procession, and I don't care what happens to me. When the people of the United States elected me President, they had the right to expect that they had chosen a man and not a coward."

All the plans for his taking part in the procession were kept so secret that there was great excitement when the word passed along the line that the President was coming from the Pennsylvania depot and would join the procession at the Battery. From the Battery to the City Hall and all along the way, he rode in an open car. After a short address by the Mayor, the *cortege* proceeded to the Marine Barracks where the President delivered one of the most moving addresses ever made by him.

The gravest gamble that Mr. Wilson ever took, except that on the League of Nations, was the armed ship controversy in the spring of 1916. It also involved the greatest risk to his political future. It was a case of staking everything "on one turn of pitch and toss." Incidentally, it was Mr. Wilson's way of meeting the deepest political intrigue of the many that were hatched against him during his ten years as Governor and President. The "politics" of the affair were carefully concealed, but may now be revealed with propriety. To those of us on the "inside" in those critical days, the political significance of the movements in that great struggle were of tremendous interest, but not an inkling of them ever leaked into the newspapers.

As a prelude to this story it may be appropriate to quote a confidential conversation that Mr. Wilson held with a friend when he was President-elect. The friend was traveling with him from Princeton to Trenton one morning and the two had been reading the morning newspapers. One paper had published an editorial, expressing grave doubt whether the secluded, scholarly college president, who had spent his life in books, would be able to cope with the adroit politicians when he went to Washington as the head of the Government.

"You know," said Governor Wilson, referring to the editorial, "it always makes me smile to read anything like that, and I always feel an impulse to sit down and write to the editor, explaining that I am not a fool but can take care of myself. Of course, that would be ridiculous, for nobody would believe it. I will have to demonstrate it before people will accept it. What nobody seems to realize, however, is that I have been in politics up to my neck for thirty years. I refer to college politics, which are so much more subtle and adroit than ordinary politics that they should not be mentioned the same day. In school politics you never know what the other fellow is going to do. He is continually surprising you and taking you unawares, because he has some brains, originality and initiative. In ordinary politics there is never anything new. The politician always does the same thing. You can count to an absolute certainty on his next move—and forestall it."

***When War With Germany Was in Sight***

Now to set the stage for Mr. Wilson's armed ship coup.

To get the point clearly one should let his mind go back to the spring of 1916, when the U-boat campaign of Germany was at its height and when German propaganda, as we afterward discovered, was being poured over the country by the ton. Germany was sinking merchant ships without warning, often "leaving no trace." International law and the custom of civilized countries for centuries had provided that merchant ships might be seized, but that crew and passengers must be given time and opportunity to save their lives. International law and custom also gave neutrals the right to travel on merchant ships of belligerents in safety.

Germany ignored these principles. President Wilson maintained them. It was over this issue that we finally went to war. In 1916, however, there was terrific pressure on President Wilson to abandon his position. Enormous effort was made to create a public sentiment in America that would force Mr. Wilson to back down. Von Bernstorff was still at Washington. As later revealed, to a shocked country, he was using his official position constantly and extensively against the President. In the spring of 1916, however, this was not known, and he was in good standing, even though unpopular in many circles.

***Americans and Foreign Merchant Ships***

The propaganda finally took a most plausible form. It was this:

Make Americans stay off English merchant ships. The idea caught on. Leaders in Congress, some of whom were friends, some secretly hostile to Mr. Wilson, made speeches arguing that Americans had no business sailing on British ships that might be sunk. If no Americans were on them, then no American rights would be violated if the ships were destroyed. Newspapers took up the cry and resolutions were intro-

duced in Congress, stating it to be the sense of Congress that Americans should not sail on foreign merchant ships and forbidding the State Department to issue passports to any one booking passage on such vessels.

The cloakrooms of the Senate and House buzzed. There was all the appearance of a revolt against Wilson's leadership. The chairman of the Foreign Relations Committee of the Senate, a Democrat, wrote Mr. Wilson pleading with him to abandon his U-boat position. The chairman of the House Committee on Foreign Affairs opposed his policy. The majority leader on the floor was in favor of the warning resolutions. The Speaker of the House of Representatives led a Democratic delegation to the White House, and with his own lips advised the President that he must yield. He declared the warning resolution would pass two to one if put to a vote. He advised Mr. Wilson to compromise rather than suffer defeat, and to issue a warning to the American people himself, as President.

In reply Mr. Wilson said:

"I cannot consent to the abridgment of the rights of American citizens in any respect. The honor and self-respect of the nation are involved. We covet peace and shall preserve it at any cost save loss of honor. To forbid our people to exercise their rights for fear we might be called upon to vindicate them would be a deep humiliation indeed. It would be an implicit, all but an explicit, acquiescence in the violation of the rights of mankind everywhere."

But the propaganda continued. Judging by the newspaper reports of the time, a great wave of sentiment for the McLenmore resolution (warning Americans off foreign ships) seemed to be rolling up from the country. It looked as if Mr. Wilson was about to meet his Waterloo, and his political opponents were jubilant.

Remember the date: February-March, 1916. A Democratic candidate for President was to be nominated in June. The Democratic platform of 1912 had pledged the party to the principle of a single presidential term. Mr. Wilson had been silent as the tomb as to a second term for himself. A sizeable army of leading Democrats in Congress still hoped to put Champ Clark in the White House. There were also a number of loyal Wilsonians who were in favor of the McLenmore resolution and who felt so keenly about it that they intended to vote for the resolution. It was openly boasted in the cloakrooms in those exciting days that the principle of warning Americans off foreign vessels would be made a plank in the Democratic platform.

Those who were intriguers against Mr. Wilson believed that this could be done, that the President would thereby be repudiated by his party and would either be defeated for renomination or would decline to be a candidate. When the joy of his opponents was at its height they received a neatly done up little bomb from the White House.

In such circumstances the average President would have called his Congressional friends into frantic counsel and appealed to them to make the usual fight against the resolution in Congress. All the tactics of obstruction, delay, debate, and parliamentary maneuver would have been resorted to. A long-drawn-out controversy, with uncertain result, would have followed.

Mr. Wilson did no such thing. He "made one heap of all his winnings and risked it on one turn of pitch and toss." He wrote a letter to Representative Pou, the acting chairman of the Rules Committee, asking a special rule to permit an immediate vote on the McLenmore resolution.

"The report," he wrote, "that there are divided counsels in Congress in regard to the foreign policy of the Government is being made industrious use of in foreign capitals. I believe that report to be false but as long as it is anywhere credited it cannot fail to do the greatest harm and expose the country to the most serious risks."

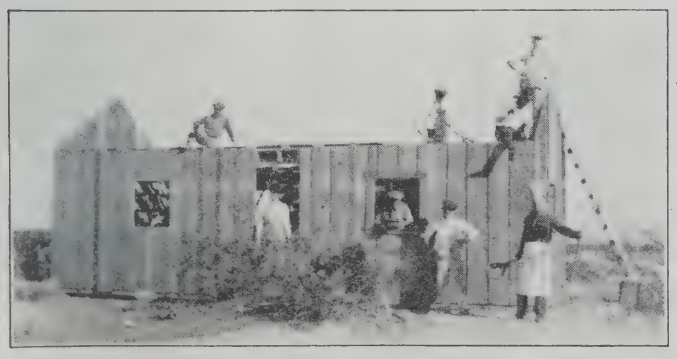
The country was electrified by Mr. Wilson's appeal and quickly made its feelings clear. The political intriguers who had thought to put the President in a hole sweated blood in the cloakrooms for five days, and then went onto the floor and voted against the resolution which was defeated 276 to 142.

Again he had counted not the cost. He had staked his all against a challenging fate and defeated it.

At St. Louis in June, Mr. Wilson was unanimously renominated by the Democratic National Convention.

# Cooperation Saves Workers From Death

By ROBERT MORGAN



"Lone Wolf Colony" in its second year.

WITH the object of preserving the health of themselves and their fellow workers, employes of the Pacific Telephone and Telegraph Company, at Los Angeles, have formed an organized army to fight the Great White Plague—Tuberculosis—with general headquarters and first line trenches four thousand feet up in the air, at Victorville, on the California Desert.

Due to these efforts, and without outside aid, five men were returned from serious illness to full strength, during the first two years of the work. The organization is known as the "Lone Wolf Colony, Inc.," and is supported by the voluntary monthly contributions of the employes.

The plan of the colony is of interest, since it could be followed by the employes of other large corporations with probably the same admirable results which have been obtained here. At first, a board of directors was formed, composed of one man from each department of the telephone company, the employes in that department holding a regular election for that director. These directors obtained permission to organize a non-profit-taking corporation, named the Lone Wolf Colony, Incorporated.

"Duplex" in process of erection at "Lone Wolf."

The corporation then purchased ten acres of land near Victorville, having found it to be impossible to complete the homestead work on the 160 acres of government land assumed by the "Lone Wolf" whose recovery inaugurated the whole project. The cabin built for this one-time sick man, however, was removed to the new tract, and became the first building of the colony. Improvements were made in it, and almost as soon as it was completed, another worker, who was stricken with tuberculosis, moved in. Three others followed, two more buildings were completed, giving four individual rooms, and the little colony was full. While these men were there, the association helped to care for the families of those who had dependents, and paid for the support of the men themselves, so that, freed from financial worries, all these victims of the White Plague had to do was roam the desert as much as their strength permitted, and regain their health. A physician in Victorville was employed to give such consultation as was needed.

Though water is scarce, the soil on this colony is so fertile that the health-seeking men were able to make some headway with small gardens. With a water supply assured from a well, fruit trees of all kinds will be planted, larger gardens laid out, and the colony made to produce at least a part of the foodstuffs consumed.

# Merry Richmond, Rich in Romance

(Concluded from page 2)

insolent," a Tory listener called it, but it carried the day, and the assembly started to make plans to equip militia.

In the churchyard of old St. John's, Elizabeth Arnold Poe lies buried. She was one of the stars playing in Richmond theater the season of 1811 when it was burned with the loss of almost a hundred lives, including the governor of the state. When Mrs. Poe fell ill at her lodgings on Main street and died, John Allan, a prominent merchant, adopted her pretty, wistful-eyed child of two.

Edgar Allan Poe passed his boyhood in Richmond, studying his lessons with his chum, Robert Stanard, and attending service in Memorial Church, built over the ruins of the theater. At 17 he entered the University of Virginia, where his career was brief, and soon he appeared on Richmond streets, too often dropping in at the Swan Tavern. Then he left the city and before long in the *Southern Literary Messenger* there appeared work of a higher order than that worthy paper had ever known. Poe was invited to become literary editor, and he returned to Richmond, a slim, black-coated figure, his girl wife clinging dutifully to his arm.

The *Messenger* building was long an object of interest, but a few years ago it was torn down and from its timbers and stone a loggia was constructed in the fairy-like gardens in the rear of the Old Stone House. This is now a Poe shrine, with an excellent collection of Poeana, including the poet's desk, and a landscape painted and signed by him, so wild in conception that it might be the setting for *The Fall of the House of Usher*. The Stone House is the oldest structure in Richmond. There is no record of its building, but the initials "I. R." would indicate that it is of King James' reign, which came to a close in 1688.

Nowhere else does the Civil War seem so real or so recent as in Richmond. Everywhere there are memorials of it. Most appealing of all is the Soldiers' Home, where the Confederate flag floats over the house, and the inmates, clad in gray, proud of their cross of honor, live over again their battle days or delightedly show visitors about their tiny museum in which "Old Sorrel," General Jackson's horse, presides like a tutelary god, from his enormous glass case.

Adjoining the Confederate Home is Battle Abbey, a beautiful marble building set in splendid grounds. One part of the edifice is adorned by mural paintings by Charles Hoffbauer, the French artist. His work was interrupted by the World War and, with the new conception gained in those fiery years, he scraped out what he had done and started anew. The four walls have for a background the seasons and depict Confederate heroes, Lee with his staff, "Stonewall" Jackson, and dashing, gay-hearted "Jeb" Stuart, with his plumed hat.

In contrast with the grandeur of Battle Abbey is the site of Libby Prison, down in the tobacco district. The prison itself was a warehouse and received its name from the sign which was not removed when the building was hastily requisitioned. One of the most remarkable incidents of the war was the tunneling out of a hundred officers who made good their escape. Nature has left a mark to show the horrors of prison life. The overflow from Libby were detained on Belle Isle, an absolutely barren island in the James River, with water forever trickling among its slimy rocks. It is not hard to fancy how dreadful a camp must have been in such a place.

Overlooking Belle Isle is the Confederate cemetery, Hollywood, so named from the many holly trees that grow in it. Here lie buried 18,000 Confederate soldiers, for the most part in unmarked graves. But the women of the Confederacy have erected for them a pyramid of rough granite, laid without sand or mortar, 45 feet square at the base and 90 feet high. It is said that a sailor convict climbed up to set the capstone and then received his freedom. On Presidents' Hill, Monroe and Tyler are buried, and close by is the lot of Jefferson Davis, pathetic with the tomb of his son killed by a fall from the balcony of his Richmond home, and an angel figure over the grave of Winnie, "daughter of the Confederacy."

There is another cemetery on Shockhoe Hill where older Richmond worthies are buried. Here lies Peter Francisco, that doughty fighter of the Revolution who wielded a sword the blade of which was five feet long and who could shoulder a 1,100-pound cannon. Miss Van Lew, the Federal spy, is buried here beneath a tomb of Roxbury pudding-stone. During the war she passed for an eccentric old lady, fond of visiting the prisons and hospitals and making friends with the officers, but later it was learned that she was in communication with the Government, even with President Lincoln himself.

Fortunately the flames which swept the city when the Confederates set fire to their warehouses lest they fall into Northern hands spared many of the old houses. There is Masonic Hall, built in 1785, and there is the White House of the Confederacy, the war-time residence of Jefferson Davis, now a Confederate museum with one room devoted to each of the fourteen seceding states. General Lee is, of course, the dominant figure. In a glass case are carefully preserved many of his personal effects, his "best" uniform in which he surrendered, and a lock from the mane of his horse, "Traveller."

Lee's residence on East Franklin street is a plain, three-story house. Here he retired after the surrender at Appomattox amid the cheers of the soldiers in blue who held the city. The house is now the headquarters of the Virginia Historical Society and contains a rare collection of papers and portraits for which a safer home is being prepared.

The Priory in Warwick, England, built about 1565, is being demolished stone by stone and will be brought to Richmond and set up in the form of Sulgrave Manor, the ancestral home of the Washingtons. One of Richmond's citizens, Alexander W. Weddell, consul at Mexico City, is thus adding to the beauty and interest of his city.

And it is still "cheerful Richmond," if not so lively as when Thackeray called it "the merriest city in America." It is preëminently Anglo-Saxon with no foreign quarter, although there is tumble-down picturesqueness in the Negro section to contrast with the rows of handsome bank buildings and pleasant avenues shaded by linden trees.

The provision stores have a cheery, festive look, with legs of lamb decorated with lacy carvings, and hams wrapped in colored paper in the place of honor. The fame of the Virginia ham is truly ancient. Colonel William Byrd I, father of the "Black Swan," left a recipe to "eat ye ham in its perfection" on the flyleaf of his Bible, and Richmond cooks have not suffered the art to wane.

The literary traditions enhanced by Poe, but established before his time, continue to flourish. Richmond was home to Thomas Nelson Page, Mary Johnston wrote there, and James Branch Cabell lives in Dumbarton Lodge, in the suburbs. Within the city, Ellen Glasgow, Amélie Rives, Mary Newton Stanard, Kate Langley Bosher, Sally Robbins, and Armistead Gordon, make a notable coterie.

# How the Indians Made Sugar

By MRS. PAUL W. EVANS

Thomas Conant, a writer of four decades ago, discovered how the Jesuit Fathers learned the art of sugar-making from the Indians. There was the annual tapping of the sugar-maple, although the Indians did not have iron kettles for boiling the sap. It was a curious question how they did manage to boil down the juice without a kettle.

They tapped the trees with their tomahawks and inserted a spile to conduct the juice from the tree to a vessel underneath. This spile was simply a piece of dry pine or cedar wood, grooved on its upper side. The process was indeed crude, yet they succeeded in producing a considerable quantity of sugar.

Their buckets were made by taking a roll of birch bark, and sewing up the ends with deer sinews or roots. No doubt the sap caught in such vessels was as sweet as that gathered in our own bright tin pails. The sap was carried from the trees to the boiling place, where there was a large cauldron made of sheets of birch bark. Beside this cauldron a fire was built, in which was placed a lot of stones. As soon as these stones were heated to a red heat, they were dropped into the birchen cauldron. As the stones were cooled they were taken out and hot ones were put in. By repeating this process, slow as it was, the sap finally boiled. The boiling was continued until the sap was boiled down and sugar was the result.

Thus sugar was made without the aid of a kettle. Mr. Conant seemed to foresee doubt in some minds, and assures us that his forefathers who came to his province in Canada handed down in family tradition the story of the Indian method of making sugar. Indeed they were eyewitnesses themselves. When settlers came, the Indians learned a better way, and traded their furs for iron kettles and began making sugar much as the white man makes it today.

# Beating the Grain of Mustard Seed

## An Elm Tree After Being Six Years Planted Grows Thirty-Five Feet Tall

By H. R. MOSNAT

A SHADE tree that is of very rapid growth and at the same time a permanent tree is a consummation that has been achieved by George Klehm, a wholesale nurseryman who operates several hundred acres of nursery about thirty miles from Chicago. But he put in at least a dozen years of work on the problem. The shade tree he has made so fast-growing is the most popular of all street trees, the elm. Besides being of more rapid growth than such short-lived and unsatisfactory trees as willow, box elder, soft maple, cottonwood and others, these elm trees are propagated by vegetative process and are almost exactly alike, which is impossible with seedling elm trees, because, as John Burroughs so beautifully says in one of his last essays, "Trees are rooted men and men are walking trees."

Those who hate to use the ax on trees that are dear to them can now escape that pang, because with this new race of elm trees no filler trees are needed, as these trees will grow in six years to about eight inches in diameter of trunk and a height of thirty-five to forty feet.

This remarkable growth has been made near Chicago on just ordinary soil and without any special care or cultivation. There are blocks of these new elms along the streets of the small town where Mr. Klehm lives, and these trees are as alike as peas in a pod. The contrast with the seedling elm trees just across the street which were planted the same week, under the same conditions, is so striking as to seem impossible. The seedling trees are hardly an inch in diameter and maybe six feet tall, and their trunks are crooked while no two are alike. On the other hand, the new elms are about eight inches in diameter at the trunk, and about forty feet tall. There are solid blocks lined with both seedling elms and the new elms, which Mr. Klehm calls the "Vase" type.

Elms have been growing in this country for a long time. They belong to the more ancient types of plants that have inconspicuous flowers, and do not depend upon insects to carry the fertilizing pollen from flower to flower and from tree to tree. These trees were growing before there were any insects in the world.

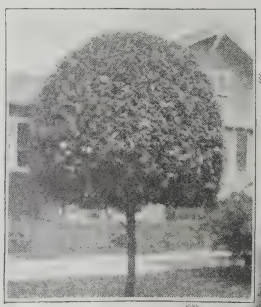
The new race of elm trees are bench-grafted on piece roots, waxed and put in a cellar to callus, and are in the spring set in nursery rows just as seedling trees would be from the seed bed. The work of grafting is done late in the winter or very early in the spring, in the greenhouse or other suitable place. Roots of seedling elm trees about the size of a lead pencil are used in about six-inch pieces, one end of which is split and a cion, or piece of the selected parent elm tree, a couple inches long, is trimmed to a wedge shape, inserted into the root piece and waxed with ordinary paraffin just hot enough to make it melt, and not to scald the root and cion.

Formerly the union was wrapped or tied with string, but with careful handling, it has been learned that waxing is sufficient and a great saving of labor. The process of callusing takes place in a cool, dark cellar and requires several weeks. By the time it is accomplished, the season has advanced to a time when the grafts can be set in the field. The process of grafting elm trees is the same as that used to graft apple, peach, pear and other fruit trees.

Mr. Klehm loves to experiment. He was the first nurseryman to put peony blooms in cold storage, and has done many other interesting things in floriculture and horticulture, in addition to producing this very rapid-growing and almost perfect type of elm tree, *Ulmus americana*, which comes absolutely uniform and true, with trunks as straight as columns, making it a tree long desired for street planting. With these grafted elm trees, instead of only about ten per cent being good enough to sell, there are less than ten per cent culls.

***Some Other Work With Elm Trees***

Some of Mr. Klehm's other original work is also with elm trees. He has another type of elm tree that he is propagating by grafting, and he calls this the Moline type, as the parent tree was found in a swamp along the Mississippi River near Moline, Illinois. This tree at first glance looks more like a poplar tree than an elm, as it has a single, central trunk to the tip of the tree, instead of a number of arching branches, as with the "Vase" type of *Ulmus americana*. In this way the greatest fault of the "Vase" type is avoided: the possibility of the splitting of the trunk where the branches divide.



The Moline type elm is also a very rapid-growing tree, with smooth, tight bark unlike an ordinary elm. The leaves are very large, often being more than six inches long by four inches broad, and very dark green, glossy, thick and free from aphis and other insect pests.

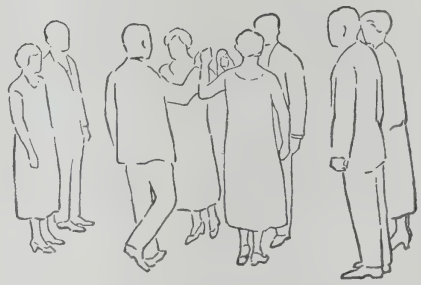
Another of Mr. Klehm's productions is the Globe-headed elm, which is long-lived and perfectly hardy in Northern Illinois. This has a dense top, and can easily be pruned to any desired shape. It is something new in ornamental trees, although Mr. Klehm has known of it for a quarter of a century. This tree is produced by the use of a trunk of the European elm, *Ulmus campestris*, which is a slow grower in this country, and has no doubt a dwarfing influence on the top, which is a cion grafted as high or low on the English elm trunk as desired. If grafted at the ground, Mr. Klehm believes that this elm would make a very fine hedge, and he is experimenting with that idea now. The Globe-headed elm can also be planted in a tub so as to be movable and be used as an indoor ornament if desired.

The Moline is a very distinct form of elm, and exceedingly rare. As far as known, this elm has not yet been identified by botanists. Possibly it is similar to the Cornish elm, *Ulmus nitens*, variety *stricta*, a beautiful tree and the common elm of Cornwall and parts of Devonshire, England, which at its best is a tree eighty feet tall and fifteen feet in girth of trunk.

It is an inspiring sight to see block after block of these grafted elm shade trees in the parking of streets, with each tree alike. This result can be accomplished only by means of grafting from very carefully chosen parent trees.

On one occasion a very fine "Vase" type street elm, about twenty years old, a rapid grower, with fine, tight, smooth bark, good form as to branches; excellent large, healthy foliage of deep green color, was chosen as a parent tree, and a few hundred trees grafted from it. It is true that there was a slight kink in the trunk of that fine elm tree, but it was not supposed that this would make any difference, and it was expected that the young trees would have straight trunks. But when the little trees grew, every one of them had that same kink in their trunk, inherited unexpectedly from the parent tree, a fatal defect for a strictly ornamental tree, such as an elm, whose trunk is most important, and should be straight as a rule and true as a die. So this otherwise most excellent tree, which had every other desirable feature for an almost perfect "Vase" type elm tree, had to be discarded.

A good example of pruned Globe-headed elm tree used as a yard tree and so grafted high.



Mr. Klehm stands six feet tall behind this six-year old seedling elm with crooked trunk.

Mr. Klehm salutes his masterpiece, the Moline type elm tree, six years planted and about thirty-five feet tall.

# A Dance a Week

## Concluding Last Three Figures of The Lancers

### FIGURE THREE

WAIT FIRST EIGHT MEASURES

First four forward and back ..... 4 bars

Forward again and address.....4 bars

First four walk forward four steps, all bow to each other. The music is retarded at this time. They return to place, walking backward.

Two ladies chain....8 bars

Ladies cross to opposite places giving the right hands as they pass each other, and the left hands to the opposite gentlemen, turning once around. Give right hand back, left hand to partner and turn in place.

Sides repeat. Play twice.

### FIGURE FOUR

WAIT FIRST EIGHT MEASURES

First four lead right, address .....4 bars

The first two couples join hands with own partners, lead to the couple on the right. All bow and curtsey.

Lead around to the left, address..... 4 bars

The same couples turn and lead to the couple on the left side. All bow and curtsey.

Lead partner to place, and address.... 4 bars

Continue to original place, and bow to each other.

First four right and left..... 8 bars

Couples cross over, ladies inside; gentleman in passing touches lady's right hand. When in other couple's place, gentleman takes partner's left hand in his left, turns half around, and repeat back to place. Sides repeat. Play twice.

### FIGURE FIVE

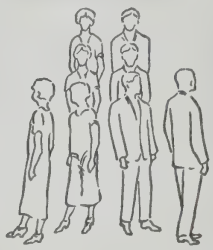
Before the music begins, call ADDRESS PARTNERS. A chord will be given by the orchestra. Then call, GRAND RIGHT AND LEFT. The movement and music starting together.

Grand right and left..... 16 bars

All face partners, salute, give right hand to partner, gentlemen moving right, ladies left. Gentleman drops his partner's hand, moves forward and takes next lady's left hand in his left, next with right, etc. When half around he meets and salutes his partner, gives her his right hand, and continues to place.

Head couple promenade inside, and face out..... 4 bars

Head couple cross both hands, promenade eight steps inside the set; return to place, and face out. Lady on right side of partner.



Side four in line..... 4 bars

No. 1 couple has already faced out, No. 3 is next to move in line back of No. 1. No. 4 now moves in place. No. 2 is already in line. Two lines are now formed, ladies on one side, gentlemen on the other.

All chasse..... 8 bars

Ladies pass in front of their partners, slide four steps with left foot to the left side, step forward with left foot, and step back with the right. Gentleman executes same with right foot, slide to right side four steps, and step forward on right foot, and back on left. All return to place in same manner, ending with the forward and backward steps.

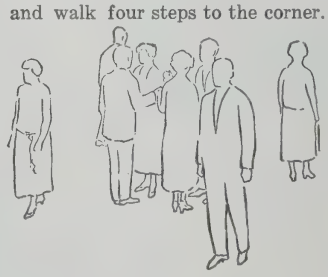
March 8 bars

Ladies right, gentlemen left. Both lines turn and march to the foot of the set, pass each other, continue on to the head, the ladies passing inside the line of gentlemen. All have now changed sides.

### LANCERS

Forward all and back..... 8 bars

Both lines turn, face each other. Gentlemen join hands in their line, the ladies the same in theirs. All then move forward four steps, back four steps, forward again and turn partners to place.



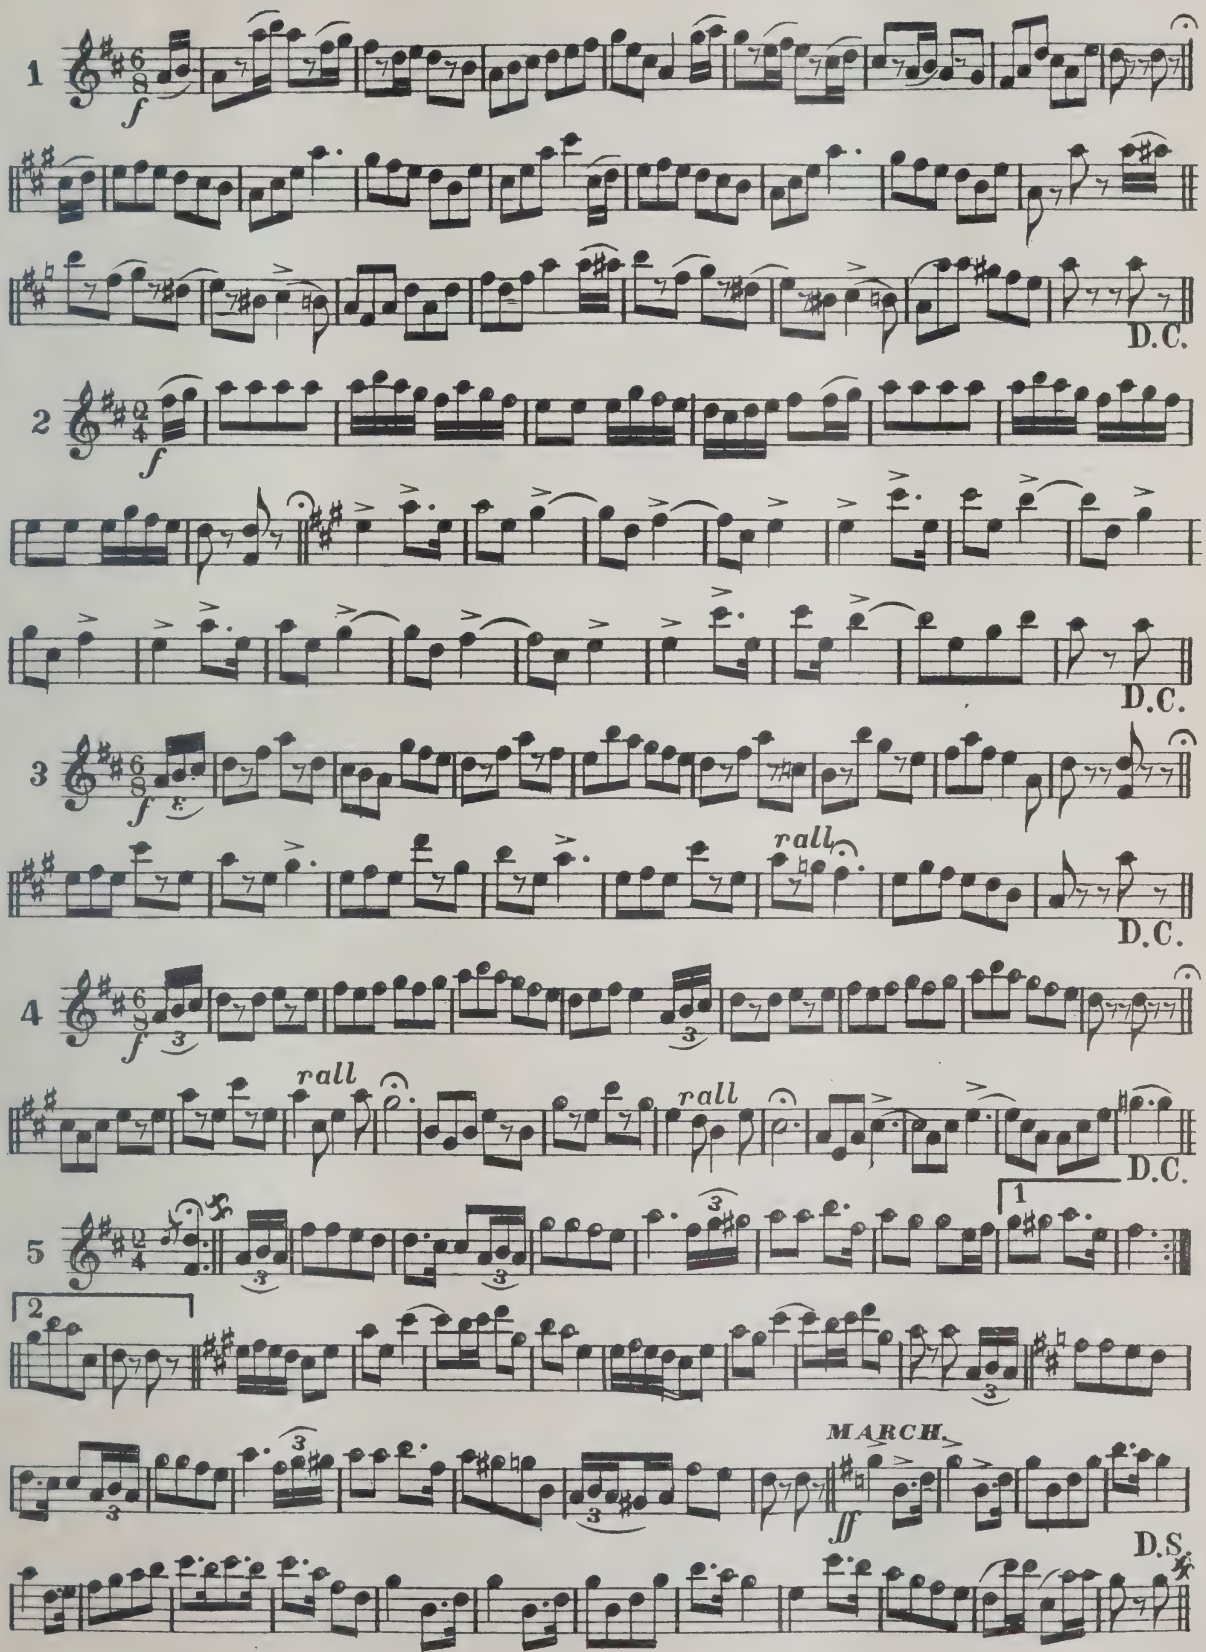
Repeat all from the beginning, the next couple on the side facing out.

### THE GRAND SQUARE

First four forward, sides separate..... 8 bars

The sides turn their backs to each other, and walk four steps to the corner. Each make one-fourth turn, and walk four steps to the head places. Make one-fourth turn, and walk to center, meet own partner, walk four steps to place. At the same time the first four advance to the center four steps, meet new partner, turn one-quarter to the left and walk four steps to the side, drop hands and walk four steps forward, turn one-quarter and walk four steps to place. (A complete square in 16 steps, four steps on each side of the square.)

Sides forward, first four separate..... 8 bars



The movement is reversed, the side moving forward and the first four turning back to back.

The third couple promenade inside, and face out..... 8 bars
All chasse.....8 bars March..... 8 bars
All forward and back, turn to place..... 8 bars
The grand square, sides forward, first four separate 8 bars
First four forward, sides separate..... 8 bars
The last couple face out, others join in line..... 8 bars
All chasse.....8 bars March..... 8 bars
Forward all and back, turn partners..... 8 bars
All join hands, forward and back, forward again and address..... 8 bars
Promenade to seats..... 8 bars

# LANCERS "ORIENTAL"

First Violin

E. T. Root & Son, Chicago.

THE LIBRARY OF THE
UNIV. OF ILLINOIS
URBANA ILL

I ESTIMATE the gift of the governing faculty to be God's greatest gift to the Anglo-Saxon, and in the constitution of the United States, with its diversion of powers, its limitations upon the governing departments and its sublime reservations in the interests of individual liberty, I see the highest achievement of that most rare faculty.

I have no argument to make, here or anywhere, against territorial expansion, but I do not, as some do, look to expansion as the safest or more attractive avenue of national development.

—*Benjamin Harrison.*

CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD

FIGURES COMPILED by the Federal Reserve Bank of Boston, a short time ago, showed that installment accounts outstanding there were 110 per cent above those of the previous year.

TEXAS HAS REMOVED all forcible restraint from patients in its six hospitals for the insane. The response of the patients has been remarkable. Only one man has required forcible handling in a year.

THE BISHOP OF LONDON, about to tour the world, begs someone to occupy Fulham Palace during his absence and pay its upkeep. He says that his ten servants are essential, but he cannot maintain them while he is away.

RECENT NORWEGIAN discoveries lead to the belief that Leif Ericson landed somewhere between Cape Hatteras and Cape Ann, not at Nova Scotia.

GIANT CARNIVOROUS lizards, twenty-one feet long, which fight with their tails, so terrorize the natives of the island of Momodo, Dutch East Indies, that no live specimens have ever been captured.

DRAY HORSES passing through a big puddle of water in a Boston street suddenly jumped about in lively fashion. Investigation revealed that a short-circuited electric conduit had given the puddle a charge of 120 volts.

LAKES MICHIGAN and Huron rose perceptibly in February, the first break in the gradual receding of these lake levels in several years.

COUNTERFEITERS ARE so clever and numerous in China that native and foreign banks are compelled to have a large staff of experts to detect spurious coins and paper.

THE CENTER OF population of the United States has never varied one degree north or south of the thirty-ninth parallel.

DEVELOPMENT OF the X-ray may enable us to see ten thousand times farther than we can today, Sir William Bragg, director of the Royal Institute of England, declares.

THE LARGEST LIBRARY in Western Europe in 1373, owned by Charles V, King of France, consisted of 910 volumes.

WHEN 200,000 ACRES of grain in the San Joaquin Valley, California, were threatened from lack of rainfall, the growers offered a rainmaker the yield of 600 acres if he could "produce" rain. Immediately thereafter the heaviest rainfall of the season occurred.

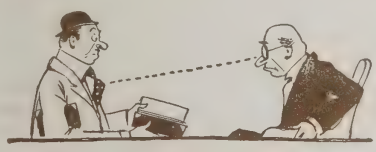
THREE THOUSAND Japanese "picture brides" have been registered for transportation to Brazil, the same number to Argentina, and two thousand to Mexico. Great colonies of Japanese bachelors live in these countries.

A FARMINGTON, New Mexico, hotel drilled a water well, connected it with a house pumping system and then oil came in and surprised the guests.

OCEAN CABLES controlled by Great Britain and America handle 90 per cent of the world's cable traffic.

OPIUM FROM INDIA has a morphine content of seven per cent, Chinese opium 10 per cent, Turkish and Persian 13 per cent. Heroin, codeine, dionin, and morphine are extracted from the latter.

ENGLISH MINERS may be compelled to carry miniature radio sets—receiving and transmitting—as a means of communication in case of disasters.



STUDENTS OF THE University of Rochester, own and operate a motion picture theater, thus earning part of their expenses.

THE FIRST FIRE engine in America was received in Boston from England 247 years ago.

CALIFORNIA IS the first state in the canning industry, the annual output exceeding $100,000,000.

CADDO PARISH, Louisiana, has spent $8,000,000 on road improvements in the past eight years without issuing a bond, the money being raised by a five-mill levy.

A TABLECLOTH once owned by Kate Douglas Wiggin contains autographs of one hundred fifteen notables, including Mark Twain, Henry Irving, Carl Schurz, Richard Harding Davis, and Annie Louise Carey.

SALESMEN OBTAIN the best results while wearing plain dark blue neckties, and the worst while wearing polka-dot ones, recent tests prove. The latter tend to confuse the beholder's eyes, which naturally focus on the tie.

THREE CHILDREN of Desert Center, California, motor 108 miles a day over desert roads to attend school at Thermal.

CANADIAN GOVERNMENT surveyors, exploring the Northwest Territories last summer, came upon a hitherto unknown lake seventy-five miles long and fifty miles wide.

WHEAT IS THE largest grain crop in the world, corn is second, and rice third. The United States produces 20 per cent of the wheat crop, 75 per cent of the corn, and less than 1 per cent of the rice.

IT TAKES $561 a year to dress a college girl, according to women's organizations at the University of California.

TEAKWOOD BEAMS which were put in place more than 2,000 years ago have been found in almost perfect condition in the old cave temples of Western India.

FIFTY THOUSAND AMERICANS, 60,000 Germans and 84,000 Englishmen now reside in France.

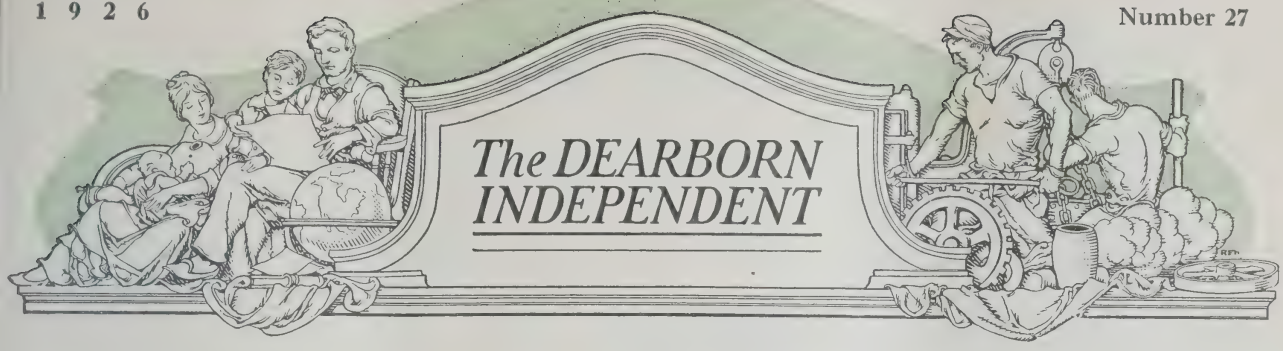
THE TYPHOID DEATH rate in Cleveland dropped from 13.3 per 100,000 population to 2.9 when chlorine and filtration were adopted for the city water system.

AFTER SEARCHING desperately all night for a man reported missing when a Hartford building collapsed, one of the rescue party learned that he himself was the supposed victim.

ONE SOLUTION of the problem of education in American universities would be in the imposition of tasks that would completely fill the time of students with hard work, according to President Angell of Yale.

THE AMERICAN ANNUAL medicine bill totals $345,000,000, two-thirds of it being for the treatment of preventable diseases.

TROPICAL ANIMALS in the London zoo last winter were provided with artificial summer sunlight by means of ultra-violet rays.



CAIRO HAS MORE jewelry shops than any other city of its size in the world. The natives either bury their savings in the earth or invest them in jewelry.

A STANDARD-KEYBOARD piano, two feet nine inches high and seventeen inches deep, has been built for an opera singer to use in a Pullman compartment while on tour.

FARMERS ARE the largest users of power in the United States, with the single exception of the railroads. Nearly sixteen billion horsepower hours are used annually on farms.

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week discusses the best time to acquire economic wisdom.

Let us have the truth about war debts. We have had everything else—camouflage, distortion, propaganda—why not *now* have the truth? Look squarely at our so-called "lenient" terms to Italy. See how both the Italian and the American peoples are deceived.

Italy, so Secretary Mellon says, can pay no more than $5,000,000 a year at this time. But five years from now this annual sum is precipitately jumped to $12,100,000 and in sixty years it becomes nearly $80,000,000 a year! If Italy can pay only $5,000,000 a year now, what assurance have we that she can pay more than twice that sum every year five years from now, and sixteen times in little more than a half-century? Is not this clearly a scheme to throw the whole problem into the future, when present politicians will be dead or out of office? (p. 3)

The Semitic Sesqui-Centennial—that is what some are calling Philadelphia's much muddled plans to celebrate the 150th anniversary of the Signing of the Declaration of Independence. Others call it a clever real estate proposition. The scandals that have arisen in concessions and constructions have been of the lowest order possible to the lowest type of Philadelphia politics—which is going some! Now the "Sesqui" is viewed askance not only by other cities but by foreign nations as well. This article about the concessions scandal explains the reason. (p.12 )

We don't have much heckling in this country. A pity too—it would relieve us of many a Congressional bore. Heckling really isn't impolite. Common people have a right to know where the seekers after public office stand on certain questions. If they fail to say, why shouldn't we "speak out in meeting" and ask them? (p. 8)

No need of building three or four houses before you learn all the tricks of the game. If you are going to buy a home site there are many things to bear in mind. This article warns you of the main items. (p. 6)

We can't all hunt polar bears. That is left to the few. But we can visit the frozen North by proxy, conducted thither by Burt McConnell who was a member of the last Stefansson expedition into the Arctic. Polar bears are dangerous, not because they dislike humans, *but because they mistake them for seals.* (p. 22)

Half of Europe hailed him as savior. He was come to free enslaved peoples, to right wrongs, to lead the world to new heights. He was to bring peace and plenty . . . Suddenly acclaim was changed to blame, hero worship to hatred. Where Wilson had once been cheered he was hooted, reviled. Why? (p. 2)

Some fiddles are just wood and strings, glued together. Others are objects of rare grace, as beautiful in shape and symmetry as in tone. These, for the most part, are the work of the old masters, Stradivarius, Guarneri, Amati. They have a charm of their own, apparent even to the amateur. Clyde Wier, author of this article and professor at Brown University, has spent a lifetime in the study of old violins. He describes them in a delightful way. (p. 16)

Lloyd George—agile political gymnast. We haven't heard so much about the nimble little Welshman in the past few years, but the fault has not been his. He has been on the outside looking in. Now he wants to go on the inside again, helped along by a socialistic land program. (p. 5)

A flash of jagged light. A deafening roar. Lightning! Should we run to take shelter under a tree? That's a question often debated. (p. 19)

From lightning to lilies is a far cry. Lilies toil not, neither do they spin; but those who raise them must do both. This is the story of a woman—a lily grower. Her "farm" on the outskirts of Washington is unusual and colorful. (p. 32)

Three months ago we printed a story on Ram Narayan, sage of Delhi, who believes that dreams bear messages for us, that in them may be found the path to truth. In this issue we offer an opinion diametrically opposed to that of the Hindu philosopher. It is by Dr. Donald Laird, noted psychologist. (p. 4)

If someone should make the observation that beavers build up while rats tear down, would *you* feel that *you* had been insulted? Certainly not. But when Secretary of Labor Davis made a similar statement in his new book, the Jews instantly took umbrage. The rat reference, they decided, was to themselves. And so they raised a great clamor and to-do until—"They Got Their Letter." (p. 10)

Why is food so high? Waste—on the farm, in transportation, in distribution. This article will prove enlightening to many who are vexed at the high cost of living. (p. 14)

# When Woodrow Wilson "Walked With Kings"

By HUSTON THOMPSON

PART V.

(C) International Newsreel.

President Wilson was always deeply touched by the expressions of American citizens whom he met. Here he is shown greeting a woman of St. Joseph, Missouri, who presented him with a bouquet.

ONE verse of Rudyard Kipling's poem, *If*, contains a couplet that undoubtedly influenced many of Woodrow Wilson's actions. It reads:

"If you can talk with crowds and keep
your virtue,
Or walk with kings—nor lose the
common touch."

The hardest job that any leader of people has to do is to keep his "virtue," by which Kipling undoubtedly meant poise and independence. A President of the United States is deluged with advice, appeals, pleadings, cajolery, flattery, threats and pressure of all kinds from all sorts of persons and interests. When he "talks with crowds" he is pulled and hauled this way and that by special advocates, usually selfishly interested. The man who can "keep his virtue" under such circumstances must have great strength of purpose.

President Wilson was instantly subject to high pressure of this character when he assumed office and called a special session of Congress to revise the tariff downward in conformity with his and his party's pledges. As is always the case, Senators and Representatives began pleading with him for protection of the industries in their own localities. In many instances strong cases were made out. He was advised that if the tariff were reduced on certain manufactured articles it would cause the defeat, in 1914, of certain members of Congress. Every conceivable kind of "talk" was discharged at him by the "crowd," and yet he "kept his virtue," which, in this case, was his and his party's promise that the tariff would be reduced.

(C) Press Illustrating Service.

President Wilson proudly regarding the veterans of the "Famous Second" as they paraded in Washington on the return from Chateau Thierry. In the President's stand from left to right — Admiral Benson, Franklin Roosevelt, President Wilson, Mrs. Wilson, Secretary Baker, and General March

An insight into his attitude toward his responsibilities at that time is afforded by the incident, related by him after the Congressional election in 1914, when the Democrats had again carried the House and Senate.

"When the Underwood tariff bill was before the Congress," he said, "I was waited upon by a delegation of seven Senators, headed by my warm friend, the veteran Senator Newlands, of Nevada, who said to me: 'Mr. President, we are the seven Democratic Senators from west of the Mississippi. As you are well aware, it is always hard to elect a Democrat in our part of the country, which is normally Republican. We feel that we constitute an important element in the Democratic majority of the Senate, and that our interests, therefore, should receive consideration. We further feel that it is to the interests of the party and of your Administration that we remain in Congress. Our retirement would practically wipe out the Democratic majority.'

"I agreed with them and asked in what particular they desired consideration of their interests. Senator Newlands replied: 'We want the sugar tariff maintained because of our beet sugar interests. If the proposed sugar rates are passed it will mean that we won't have a Democratic Senator west of the Mississippi.'

"I said, 'Well, gentlemen, in the first place, I do not take the same pessimistic view of the situation that you do. I don't believe the adoption of the proposed rates on sugar will have any such effect. However, I do believe this: that if we repudiate our tariff pledges and continue to impose upon the American consumers the burden of this high sugar tariff, it won't make any difference whether we have *any* Senators west of the Mississippi, for the simple reason that the Democratic party will be kicked out of office by the American people.'

(Continued on page 26)

# Italy's Debt—Here Are the Facts

## The Schedule of Annual Payments to America Is Printed in a Box on This Page

By HARRY PENCE

ON OR about December 1 last year the Government Printing Office supplied the press associations with advance copies of the annual reports of the Federal departments, bureaus and commissions which were sent to newspapers with the warning that they were to be held as confidential till officially released.

These reports were accompanied by expertly compiled abstracts or digests for the benefit of the busy editors, who were free to publish the abstracts and as much of the reports as they saw fit, with such comments, editorial and otherwise, as they pleased.

All this is perfectly regular and apparently an excellent system for the dissemination of public information, if only the newspapers do their part.

Among these advance copies was, of course, the annual report of the Secretary of the Treasury "on the state of the finances for the *fiscal year ended June 30, 1925*," yet pages 48 to 67, inclusive, are devoted to the progress achieved in refunding the war debts of European nations, five of which were thus refunded *after that date*, and to the French debt negotiations which collapsed October 1.

The inclusion of this important and increasingly interesting matter not pertaining to the period covered by the report manifested commendable enterprise on the part of the Treasury officials. It was fit and proper that it be thus set forth.

But why was not a thoroughgoing job made of it? The advance copy of the report did not contain the schedule of annual payments which is printed in a box on this page, a factor as vital to the soundness of the settlement as any other and more so than most.

Instead of doing this the compilers of the report grouped all such tables and statistical matter as "Exhibits" in an appendix and did not include the appendix in the copies distributed among the newspapers that they might inform the public.

The newspapers had had one previous opportunity to disseminate this information. When the Italian debt settlement was made, November 14, 1925, a full report containing this schedule was given out. A few, very few, of the papers in the larger cities printed the schedule.

Newspaper editors do not take kindly to matter of this sort. It is difficult to set, hurried composition increases the chances for errors and, most of all, they are firmly convinced that their readers do not care for it.

Therefore a very small fraction of the American public *has had an opportunity* to be informed as to just what the Italian representatives have obligated the Italian people to do and therefore the schedule printed herewith has all the qualities of news. An examination of it will reveal that it is *big news*.

For the first five years Italy is to pay a sum equivalent to *less than one-fourth of one per cent of the principal* and is *entirely relieved of interest payments*. This interest is not deferred; *it is written off*.

No wonder the Italians rejoiced when informed, probably as scantily as the American public, of the terms of the settlement or that Mussolini contended that the generosity of American financiers, public and private, implied approval of his—well, rather autocratic régime.

The report explains that these terms were agreed upon as fitting Italy's capacity to pay. It stresses the fact that her present fiscal condition and trade balance are unfavorable, adding that she is "a country poor in natural resources" which must import food products as well as raw materials. This is but another way of saying that she is without an adequate national agriculture as well as coal, oil, iron, copper and wood. The report also says her population is rapidly increasing.

For these reasons the wind was tempered for the shorn lamb—for five years. America was so informed, in very general terms, and apparently approved the settlement. Feverish as is the chase of the dollar in these United States it is rather for the zest of the chase than greed for the game. No people ever loved the actual dollar less and no normal American ever pursued it at the cost of hardships or suffering to friend or stranger.

"The best they can do is good enough for us," was the national verdict. "Let it go at that."

But just relegating to the future the eventual day of trouble is no settlement; it is a sham. Premonitions of that day of trouble leap from that schedule of payments and smite the eye.

If Italy can pay only five million dollars a year for five years upon what did her accredited representatives base their faith that on the sixth year she can and will pay *twelve million?*

Were they or were they not rendered unduly optimistic by their zeal to pry open the locked coffers of the New York money lenders?

And if the burden of twelve million can be carried what assurance had the negotiators, American or Italian, that *twenty*, and *thirty*, and then *forty* and finally *nearly eighty million a year* can and will be willingly borne?

*At the rate of five million a year it would take Italy 481 years to dispose of this debt, but she has obligated herself to clean it up in 62 years.*

To do so her annual payments must average approximately thirty-nine million dollars a year and even a child knows that to begin small and increase progressively to attain a certain average the later payments must be proportionally greater than the average.

The American people do not know that there has not been sown in this and other debt "settlements" the seeds of future discord and international friction.

| | |
|---|---|
| Italy's original debt (approximately) | $1,648,000,000 |
| Principal and accrued interest, 1925 (approximately) | 2,042,000,000 |
| Anticipated total payments (approximately) | 2,407,000,000 |

INTEREST PAYMENTS REQUIRED

| | |
|---|---|
| 1926 to 1930 | None |
| 1931 to 1940 | One-eighth of One per cent |
| 1941 to 1950 | One-fourth of One per cent |
| 1951 to 1960 | One-half of One per cent |
| 1961 to 1970 | Three-fourths of One per cent |
| 1971 to 1980 | One per cent |
| 1981 to 1987 | Two per cent |

SCHEDULE OF PAYMENTS ON PRINCIPAL REQUIRED

| | | | |
|---|---|---|---|
| 1926 | $5,000,000 | 1957 | 28,500,000 |
| 1927 | 5,000,000 | 1958 | 29,600,000 |
| 1928 | 5,000,000 | 1959 | 30,500,000 |
| 1929 | 5,000,000 | 1960 | 31,500,000 |

# What Our Dreams Mean

DRAWINGS BY EDITH GRIEVE

## The "Latent Content" of a Dream Furnishes Key to Its Interpretation, Scientists Say

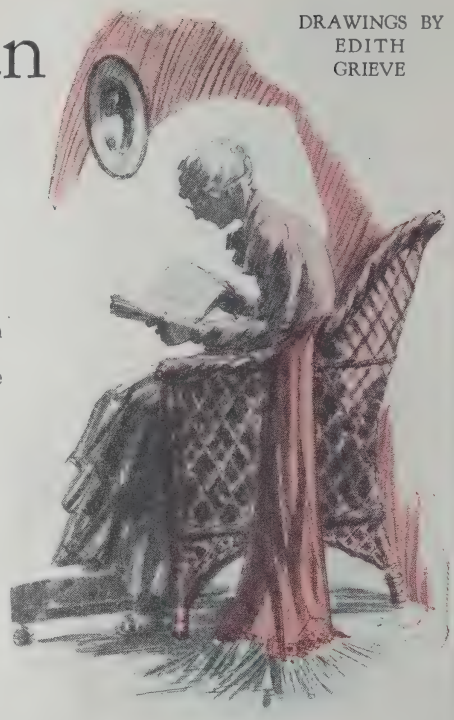
By DONALD A. LAIRD, Ph. D.

A LOVELY old lady of my acquaintance consults her "dream book" regularly every morning to find what the night's dreams portend. If she had been planning a visit but finds that her dream means, according to the book, that new undertakings will meet with disaster the visit is promptly canceled. For days after she has dreamed of an acquaintance who is dead she trembles every time the telephone rings, and is agitated at the sight of a postman or telegraph boy—since the book has told her that to dream of the dead means one will hear of death from the living.

Dreams may not tell the future in this way, but they do tell much about the dreamer.

Some nights one may not appear to dream because he is unable to recall any on awakening. This shows that the dreams are forgotten on awakening rather than that one has not dreamed. It is quite possible that we dream continuously all night, the dreams we remember being those which take place when sleep is lightest.

Some people can even dream while they are apparently awake and walking around. Some years ago, for instance, Dr. G. T. W. Patrick was engaged in experiments in which persons were kept awake for three or four days. One very conscientious young man quite naturally found it difficult to remain awake after more than two days without sleep. To keep him awake he was walked briskly about town early in the morning.



On returning to the laboratory he smiled guiltily and said that he had several dreams while he was being walked around to prevent those very things.

These dreams reveal that mental life is still active, even in deep sleep. The sleeping dog we watch by the fireside and see move his feet in regular rhythm and hear give a few half-choked yelps is dreaming, of what we know not, perhaps of the chase of rabbits, but nevertheless dreaming and giving signs of mental activity though deep in sleep.

The mental activity in sleep and the bizarre, fascinating experiences have very definite meaning at times. This meaning is not quite what the lady with her dream book thought, and we may add in anticipation it is probably not quite what many psychoanalysts claim it to be.

Why do we dream what we do? Sometimes it appears that factors in the surroundings will start dreams. Thus the man with his feet uncovered on a chilly night may dream he is with Peary at the North Pole, or he may dream he is in battle and has been hit in the foot.

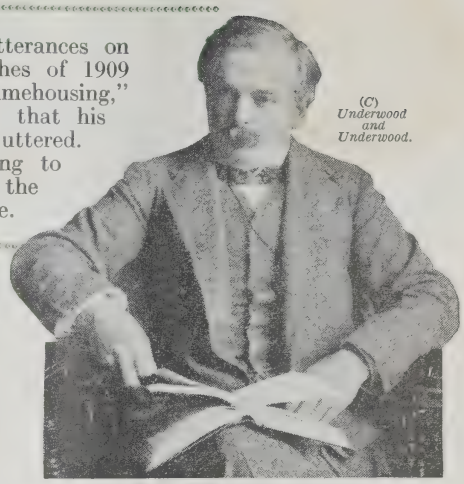
Startling experiences of the day may cause a dream. Or some trifling event of which we were scarcely aware may start it. An Englishman, for instance, dreamed about Oxford and a small market town named Wickham. This seems to have been inspired by reading during the day the motto "Manners makyth man." This is the motto of Winchester College, one of the famous English public schools which was founded by William of Wykeham, who was born at Wickham and founded one of the colleges of Oxford.

"A lovely old lady of my acquaintance consults her 'dream book' regularly every morning."

It is most often the little things that count in starting dreams. And in interpreting dreams it has been found that it is again the little things which matter. About some of these little things scientists are in agreement, but about a number of them there are some of the hottest disputes one can imagine.

Things which appear to last a month or even a year may transpire within a second in a dream. About this there is no dispute. Take the following: The dreamer hears the executioner's bell toll, sees himself given religious rites, then walks a long distance through subterranean corridors to a scaffolding where the hangman's noose is painstakingly adjusted, only to awaken and find that this long and tedious procedure which caused so much anguish was started by his alarm clock, which is still merrily calling him.

"This long and tedious procedure which caused so much restless anguish was started by his alarm clock, which is still calling him."



Then there is the peculiar nonsense which often is in dreams. In many cases it can be found mixed with sense.

A man dreamed, for instance, that he saw a book written by a friend with the title of *Bragmatism*. The dreamer had a friend who was continually telling about a book he was going to write on the philosophical subject of *pragmatism*. About

(Concluded on page 25)

LLOYD GEORGE'S silver tongue is a biting one, and his recent utterances on land nationalization in Great Britain recall his scarifying speeches of 1909 when his attacks on the dukes and the dukeries were labeled "Limehousing," because it was in the Limehouse division of the East End of London that his fierce denunciations of landlordism and the land laws were uttered.

The following article shows that "the Little Welshman" is trying to form what has been called a "Lib-Lab" party, with "The land for the people" as a rallying cry. But he has a hard row to hoe.

(C) Underwood and Underwood.

# Lloyd George Seeks Power on Land Scheme

## British Leader Raises Land Reform Slogan in Endeavor to Come Back With United Party

By PAUL TYNER

IT'S FUN to sit on the fence and watch yourself go by. If David Lloyd George could ever detach himself from himself for five minutes and from the whole procession—horse, foot and artillery—which his progress forms, this reflection might well occur to him. The National Liberal Convention on the land question at Kingsway Hall really completed a circle in his career which started during the campaign of 1909, when he first came into the limelight as sponsor for a radical land program calling for the assessment and rating of land values. In England, unlike the practice in the United States, land as land pays no taxes, the contributions levied on real estate for local purposes being termed "rates." In normal times these rates run to about four shillings in the pound (or 20 per cent) of the annual rental value of the rated property. Since the war they have averaged about double this amount, in some cases (as in Sheffield) running as high as 25 shillings in the pound, or 125 per cent.

This, of course, throws the great burden of taxes on the towns and the productive industries of the towns and cities, letting the big landholders go practically scot-free. By the Agricultural Rates Relief Act, passed under the Balfour administration, ten shillings in the pound of the rates imposed on "agricultural land" were excused and so made a present from the taxpayers to the landlords. Since then, Mr. Baldwin, to "relieve distressed agriculture," has knocked off another five shillings. The landowners simply capitalize the gift and add it to the selling price of the land.

The land scheme to which the Liberal Party in Britain now stands pledged bears a striking resemblance to that which Lloyd George championed so eloquently, persistently and convincingly in the famous campaign of 1909. His fiery denunciations of landlordism at that time made him a popular hero among the masses and brought thousands and thousands of workingmen's votes to the Liberals. But it also earned him the fierce hatred of the landholding and middle classes generally. The business and financial interests were especially denunciatory and there was genuine distrust of what might happen to the country when the outbreak of the war found the "wrecker" and "revolutionary" at the head of the national treasury as Chancellor of the Exchequer. This sentiment prevalent in financial circles underwent a marked change a little later when he called a meeting of the great bankers and financiers and proved himself the only man present capable of grasping the situation with boldness and formulating a practical and immediate program calling for genuine initiative.

His speeches during the 1909 campaign had given much heart to the workers and especially to the advocates of Henry George's ideas; for the movement to substitute the "unearned increment" of land values for all other forms of public revenue, and long known as the "Single Tax" movement, had been making as much headway in Britain as in the country of its origin.

***The "Single Taxers" Were Greatly Disappointed***

I remember well a talk I had with Henry George, Jr., on his return to the United States after the 1909 campaign in which he had appeared with Lloyd George on the platform at many meetings. He was most enthusiastic over the British politician's espousal of his great father's doctrine and the prospect of that doctrine's rapid advance to foremost place in the practical politics of Britain.

Great was the disappointment of the land reformers when, after the abortive attempt to obtain a valuation of the lands of Great Britain for the purpose of full taxation as a starter, the Asquith government turned its back on the entire proposition; this on the specious and palpably insincere plea that the war made it untimely. As a matter of fact, in those crucial days when the nation needed every penny it could raise for defense, resumption of its ownership of the land and collection of the rental properly accruing to it, would have been carried through as a truly patriotic measure.

Lloyd George's silver tongue is a biting one, as illustrated by his recent comment on Sir Alfred Mond's desertion of the Liberal organization to go over to the Conservatives: "Like another member of his race, he has gone to his own place," and "No new gospel has ever been preached but men of great possessions have gone away sorrowful."

***"Limehousings" That Are Remembered***

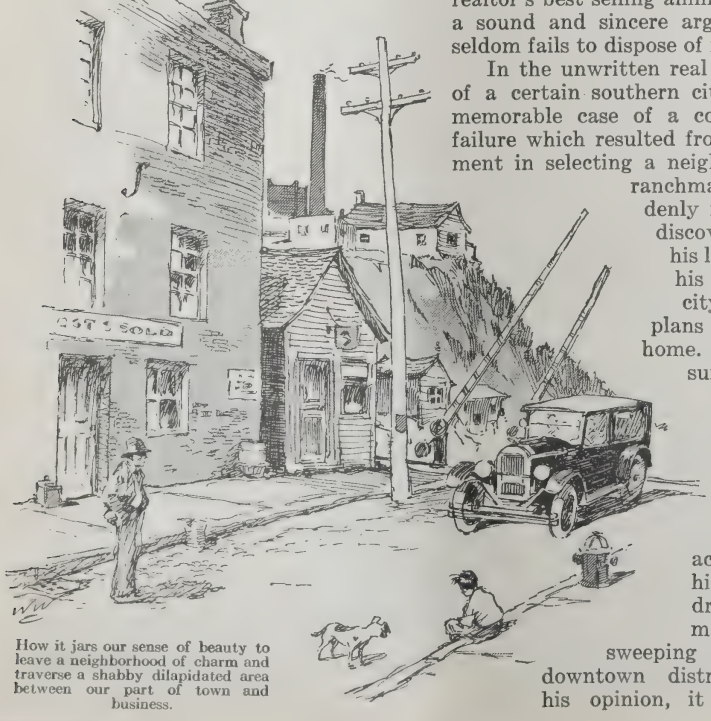
In that earlier campaign, he did not scruple to hurl his bitterest sarcasm on vested interests and the privileged classes. "The peerage," he said, "was created to ennoble the indiscretions of kings." Other of his biting sayings were: "Aristocracy is like cheese—the older it is the higher it becomes." "We look upon dukes as the Egyptians look upon the Pyramids; a fully equipped duke costs as much to keep up as two dreadnaughts, and dukes are just as great a terror—and last longer."

The idea that inspired Lloyd George's land scheme is purely that of a politician. Day by day since the last general election, it becomes increasingly evident that the one great national issue looming up before the people is the land issue. He realizes to the full that Liberalism's last chance of rehabilitation is to go one better than the Socialists in the matter of a land program. So nearly a year ago he had a special committee appointed to survey the ground and prepare a draft policy with which the Liberals could make strong appeal to the growing current of radicalism (Continued on page 20)

# When You Buy Your Own Home Site

## Evil Surroundings Often Corrupt Good Properties

By PAUL ADAMS



ILLUSTRATED BY W. W. CLARKE

IT IS regrettable that the average man's selection of a lot on which to build his home is so often based on guesswork rather than on a careful analysis of important factors. The house, not the lot, he is likely to consider the important thing. With a few requirements hazily in mind, he makes his choice of a home site, puts his signature on a check and an earnest money contract, and then repents at leisure. Sometimes he is lucky and makes a good selection. At other times he pays a high price for the folly of carelessness and ignorance.

The serious mistakes come from a failure to anticipate the problems that may arise in connection with the new home. The inexperienced builder is like a man starting out gaily on a strange journey, unaware of certain dangers lurking in his way. The man who has built several houses is not likely to repeat his early errors. But the average man does not build several houses. One home may serve him many years or for his remaining lifetime. To succeed in his plans, he must be wary and farseeing.

The first and most important step in buying a site is to make sure of the high character of the neighborhood. The leading subdivision experts of the United States, the men who make a study of successful homes their life work, all agree on this point. Good neighbors are an invaluable asset; bad neighbors do incalculable harm. The value of a good neighborhood to a man's children, to his wife, to himself, cannot be measured. The skillful realtor uses this appeal effectively in his advertisements. He tells you that you will be proud to have your children grow up with the children of the people who live in his subdivision. He publishes lists of prominent property owners as well as letters from them, stating their satisfaction with the property he has sold them. This appeal to deep-seated instincts is the realtor's best selling ammunition. It is a sound and sincere argument which seldom fails to dispose of many lots.

In the unwritten real estate annals of a certain southern city, there is a memorable case of a costly building failure which resulted from poor judgment in selecting a neighborhood. A ranchman, grown suddenly rich from the discovery of oil on his land, preceded his family to the city to make plans for a fine new home. After a brief survey, he found what impressed him as a most attractive site. It comprised nearly an acre; it was high and well drained, commanding a sweeping view of the downtown district; and, in his opinion, it was cheap. Though the neighborhood was somewhat shabby and run-down, he believed it entirely respectable. With characteristic haste he bought the ground, engaged an architect, and started to build.

How it jars our sense of beauty to leave a neighborhood of charm and traverse a shabby dilapidated area between our part of town and business.

The dwelling cost many thousands of dollars, and it was beautiful, wisely planned, luxurious, and comfortable. It possessed most of the home conveniences known to the modern sybarite. A landscape architect worked wonders with the grounds. When the rancher's family moved in, they were delighted. This was the fulfillment of their dream and they thought no finer palace existed.

In a few weeks a cloud appeared. The neighborhood was *not* entirely respectable. In fact, it was not a fit place for the ranchman's wife and children. His wife learned that several other sections of the city were far more attractive, possessing moral influences which were excellent. After much worry and discussion, they decided the best thing to do was to sell and then build another home.

But they found they could not sell. Nobody wanted a high-priced mansion in a bad neighborhood. For months the property was advertised in the local newspapers after it had been listed with various real estate agents. Everybody in town knew it was for sale. At length a family of foreigners, newcomers, appeared and offered for it a sum many thousand dollars less than it had cost, and the troubled ranchman eagerly snatched it. But he realized that his mistake had cost him a small fortune.

It isn't hard to find the best residential districts of a city, because usually they are pretty well defined. They often lie in the direction of the town's largest growth. Besides the advantages for living purposes, ground bought here, as a rule, holds its own or increases in value.

Next to neighborhood in importance is the nearness of your lot to stores, schools and churches. A moment's reflection suffices to show how much these necessities count for. If whenever

After you have spent a small fortune on your home, an oil refinery is constructed half a mile away which disfigures the landscape, while the breeze wafts you its obnoxious odors.

a housewife wants a loaf of bread or a pound of butter, she has to go or send two miles to the nearest store to get it, she is greatly inconvenienced many times. She may indignantly rebel against such injustice and insist upon a change of residence. The school problem is an even greater consideration. You can't have the youngsters exhausting themselves daily by walking many weary blocks to the schoolhouse. Sometimes it is expensive or inconvenient to supply transportation for them. And then what about your church? Is it situated nearby or far away on the other side of town?

Transportation facilities also must be carefully considered. Where is the nearest street car, bus line, or railroad station? If you depend entirely on your automobile for transportation, don't forget that automobiles sometimes have a disconcerting way of refusing to work when you most need them. If you own two or three cars, you undoubtedly have a servant problem, and servants are deeply interested in transportation. The housewife who lives in the country knows how hard it is to keep servants when they have any difficulty in getting to town.

Many an ambitious subdivision has been a costly failure for its promoters because they failed to provide for convenient stores, schools, churches, and transportation.

Next comes the matter of approach. A certain western real estate firm, in advertising its favorite subdivision, shrewdly announces that in driving downtown from it, "you never leave a paved street, never cross a railroad, never pass through an unsightly section." These are weighty arguments. What is the good of two miles of well-paved streets if, every time you drive to your office, your car must struggle through one or more blocks of mud or dust? No matter what precautions are taken, railroad crossings are dangerous; cold statistics prove it. How it jars our sense of beauty to leave a neighborhood of charm and distinction each morning to traverse a shabby, dilapidated area that lies between our part of the town and the business district. The approach certainly requires a complete examination before you buy your lot.

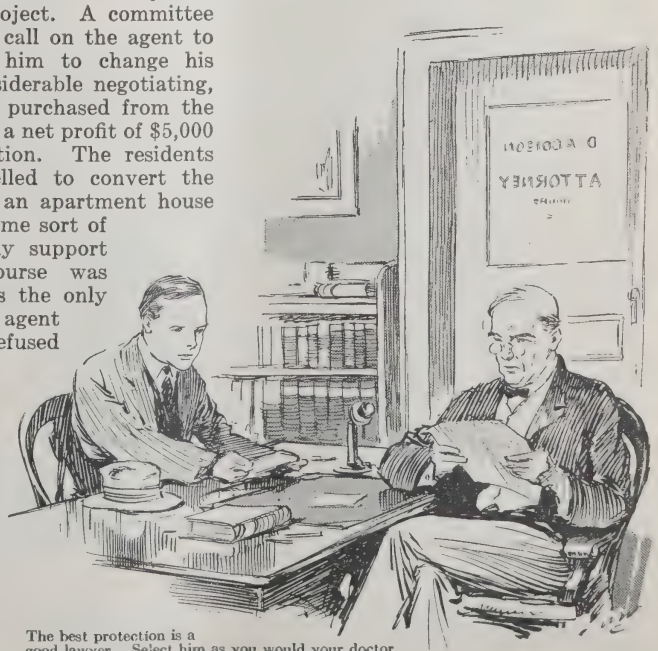
Nothing safeguards the desirability of a neighborhood more than wise building and ownership restrictions. A person can make no greater mistake in buying a home site than to overlook these matters. Everything else may be perfect, or nearly so, but if your neighborhood is not properly restricted, your home may be ruined and its value greatly depreciated.

An experience of certain property owners in a southern city strikingly illustrates this point. A prominent corner in an old but highly improved residential section was bought by a real estate agent who intended to construct a business building upon it. His plan called for several small food stores, which he believed would do a flourishing business with the wealthy surrounding residents because of the convenience of the location. He ascertained that there were no restrictions in his deed which prohibited a business building on the lot. The agent paid all that the corner was worth and then began tearing down the old-fashioned two-story home which occupied the ground. By this time the news of his plans had reached the neighbors. They were indignant at the thought that a butcher's market, a grocery store and a baker's shop were about to invade their aristocratic precinct. The absence of such establishments had long been a matter of pride with them.

A dozen of the wealthiest residents met one evening to discuss ways for preventing the project. A committee was appointed to call on the agent to try to persuade him to change his plans. After considerable negotiating, the property was purchased from the realtor, who made a net profit of $5,000 from the transaction. The residents were then compelled to convert the old dwelling into an apartment house to make it pay some sort of income and partly support itself. This course was costly, but it was the only one available. The agent had positively refused to give up his plan unless the residents would buy the property at once at his price.

This mishap resulted from the failure of the promoter thirty years before to place any building restrictions on the property. The experience may be repeated at any time because not one lot in the neighborhood is protected by these all-important provisions.

Here are some of the important building restrictions—restrictions essential to the development and maintenance of a beautiful residential section:



1. Business establishments are not permitted except in certain blocks set aside especially for them.

2. The erection of a stable, garage or any other outbuilding must be made in a certain specified location on each lot.

3. Not more than one house is allowed on each lot except where a group plan has been introduced, such as would be the case with apartment hotels and larger buildings used only for dwelling purposes.

4. In certain respects, plans of all buildings must be approved by the subdivision company. For instance, on certain streets dwellings must be constructed of stone, brick or hollow tile; elsewhere the material used may be brick veneer or stucco on metal lath or even plain lumber. There are minimum cost requirements. On one street a dwelling must cost not less than $8,000; on another, not less than $10,000; on another, not less than $15,000.

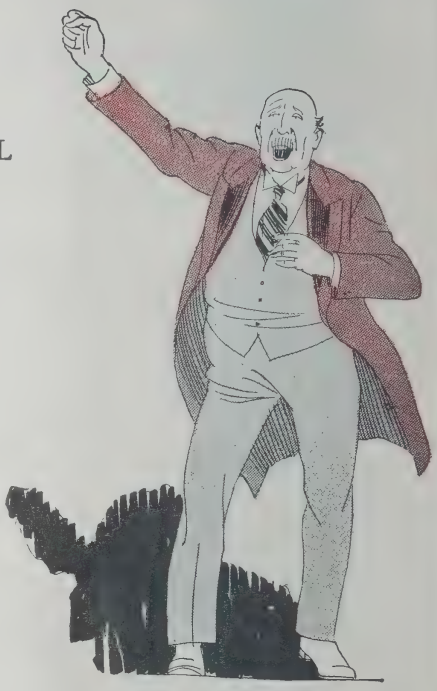
# Heckling—a Great British Institution

## The Heckler's Job Is to Catechize Candidates

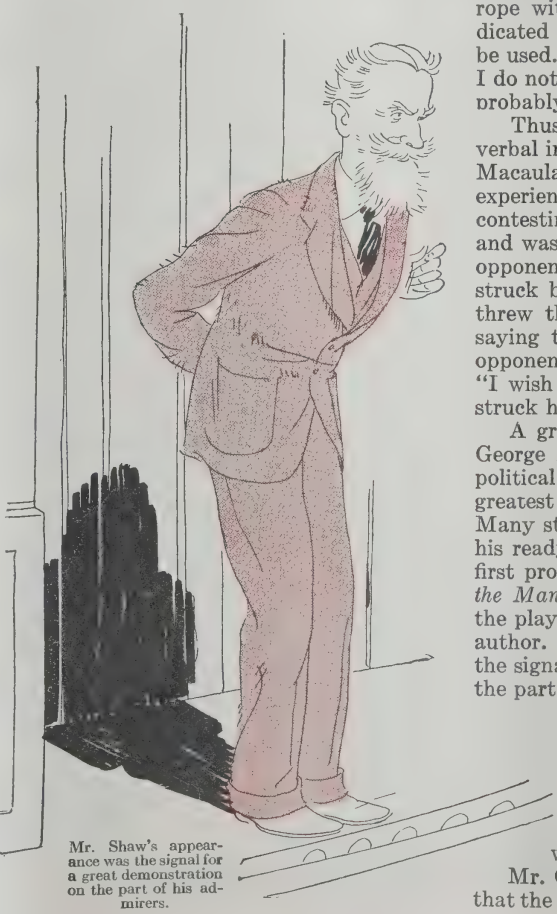
By JOHN BASIL BARNHILL

A portly lady whose charms were certainly not of a physical character was addressing a temperance meeting.



SEVERAL years since the writer was seated in the men's gallery of the House of Commons, anxiously waiting for something to transpire which would be worthy of the traditions of that august assembly. This solicitude was fully shared by an Irishman sitting near who finally, in evident disgust at the tameness of the proceedings, left with the remark: "We would not run it this way if we had it in Dublin."

It is indeed true that not only the Irish voter but the English as well insists on a great deal more excitement in his politics than the American voter gets in his. This is largely due to the custom of heckling, under which the most humble citizen has a right to catechize any candidate and any political speaker. The legitimate drama has little chance in competition with the political drama where heckling exists. Stormed at by the shot and shell of infuriated parliamentary opponents, Mirabeau once cried out: "Gentlemen, when these amenities cease, I will resume my remarks."



But the beauty of it is that the "amenities" never do cease in a British election. The addition of several million women voters to the British electorate has added materially to the number of such "amenities" and has not perceptibly increased the joys of the candidates and spellbinders. For instance, in a recent campaign, after listening to a candidate, one of the gentler sex rose and, addressing the speaker, said: "If I were your wife, I'd give you poison." "Madam," replied the speaker, "if I were your husband, I would take that poison." Here was beautifully exemplified what the philosophers call harmony in diversity.

It will be seen that the feminists are not spared when they essay to guide and instruct the British voter. A portly lady whose charms were certainly not of a physical character was addressing a Liberal meeting on temperance reform and while dilating on the evils of drink, made the following statement: "My friends, I myself had a husband who was addicted to the bottle. He was a great trial to me, but one day I persuaded him to sign the pledge. When he did so, my joy was so great, so overwhelming, that I flung my arms around his neck and kissed him." "And sarve 'im jolly well right, too," added a voice from the crowd.

Some of the stormiest scenes ever witnessed at an English election occurred in the parliamentary contests of Charles James Fox. It is related that a voter who was obviously opposed to Fox ventured to offer him a piece of rope with a gesture which clearly indicated the manner in which it should be used. "Thank you," said Fox, "but I do not wish to deprive you of what is probably a family heirloom."

"That's a lie!"

Mr. Shaw's appearance was the signal for a great demonstration on the part of his admirers.

Thus opposition is not limited to verbal inquiries. On one occasion Lord Macaulay had a rather unpleasant experience at Edinburgh. He was contesting a seat in that constituency, and was standing side by side with his opponent one evening, when he was struck by a dead cat. The man who threw the animal at once apologized, saying that he meant the cat for his opponent. "Well," said Macaulay, "I wish you had meant it for me and struck him."

A great campaigner was lost when George Bernard Shaw turned down a political career to become one of the greatest playwrights of his generation. Many stories are told in illustration of his ready wit. On the occasion of the first production of his play, *Arms and the Man*, the audience, at the end of the play, insisted on a speech from the author. Mr. Shaw's appearance was the signal for a great demonstration on the part of his admirers. But amid the tumult of applause could be heard a solitary hiss from the gallery. Mr. Shaw began his speech as follows: "I quite agree with my friend in the gallery, but what are two among so many."

Mr. Gladstone on one occasion said that the best example (Concluded on page 20)

# MR. FORD'S PAGE

THERE is always hope in the world's blunders, the hope that something will be learned from them. Sometimes that hope is realized, sometimes it seems to be deferred, and the world tastes truth in that ancient saying, 'Hope deferred maketh the heart sick.'

Two points must somehow press themselves into world consciousness before the underlying progress which we have made can become immediately apparent. We must know when is the best time to learn, and then we must know wherein we can find the elements to build the thing which the world most desires.

The best time to learn is when things are going well. It seems a simple statement to make, but it is rather more important than it seems. Part of its importance dwells in its suggestion that our common practice is the opposite. For uncounted generations (strange that we should be unable to count the generations; some day we may learn that a man carries the number of his generations in him, as a tree carries the record of its age in its rings)—for as long as we know man, he has made his studies of life at the most unpromising moments, at times when it was least possible to learn anything.

Medicine, for example, has studied disease, until very recently when it has begun the intensive study of health. The worst time to learn about health is in sickness. Health being the objective, it naturally offers the best facilities for study when it is present. Knowledge of the normal has more value for mankind than knowledge of the abnormal. The greatest human subject is sanity, in mind, body and estate; in economics and international politics; in philosophy and religion. How great is sanity we do not yet know. It is the region toward which the world marches, but we are still far from arrival.

In economics we seldom hear of better methods until ruin threatens. It is during 'hard times' that all the theories of social justice spring up. Depression and collapse bring business men together to 'study the situation.' At other times they are too busy taking advantage of it. Yet the best time to study the economic situation is when everything is going well, as we think. We do not get much of an idea of a locomotive when it lies twisted and smashed across the tracks after having met in collision a superior resistance; we do not learn much about a motor car that has been mangled at a railroad crossing; and neither do we learn much about our social system in periods of breakdown.

The time to examine the locomotive and motor car for excellences and defects is when they are functioning at their best. Then is the best time to consider where they may be improved or strengthened or made to render better service. And that is the time when our economic system may be best studied also. But the men who could study it with practical wisdom are not interested then; as long as the system meets their desires at the time, it is good enough for them. They are not roused to examination until the system breaks down. That is the wrong time to get knowledge.

*THE world's biggest problems could be solved tomorrow if the nations could be set at work. For four years of feverish 'war work' the world is now paying the price of the most colossal idleness it has ever witnessed. Leagues and treaties, councils and courts have not turned any wheels of industry, have not led the people to their sources of wealth. The greatest hero that could arise in Europe today would be the man who could lead the people to work, for out of land and labor come peace and prosperity. Honest work is the truest pacifist, because it is also armed with potential strength against those who would destroy its peace.*

And then, secondly, the question where to look is important. After all is said and done the bases of all our triumphs and mistakes are the same, land and labor. People have looked everywhere else for light in the problem of life, they are looking everywhere else today, and they have not found light. Who are regarded as the men most able to mend the world just now? The politicians and international bankers.

The whole world gapes in wonder round a little room where a dozen men sit and talk, as if the issue of that talk could be a new world. These men talk of nothing real, nothing inherent in the people's lives—they talk an artificial thing called politics, which they support with an equally artificial thing called finance. And the nations wonder why these men never originate the new world, never settle the old problems. It is because they are not looking in the right place.

The international question could be solved tomorrow by setting the people of the nations at work. Industry is the normal method for the outlet of human energies, and when that is denied mischiefs come in. Wars grow out of idleness and issue in idleness and foster idleness as the breeding ground for further wars. For four years of 'war work' the world has paid with eight years of such colossal idleness as has never been seen before.

Yet no statesmen discuss that; their realm is politics; they trust in treaties and councils.

The hero of Europe would be the man who could put it to work. He would be the greatest promoter of peace. Honest work is the true pacifist, because it is also armed with potential strength against those who would destroy its peace.

## A "Healthy" Market

"HEALTHY liquidation" was the phrase that appeared in the market reports; but whose health was improved?

Wall Street has had another shakedown. Hard-earned cash has been left there by many a simple soul who accepted unquestioningly the theory that Wall Street is the barometer of the nation and the nation being prosperous Wall Street prices must go on up indefinitely.

We are rich, and powerful, and are making good money; we are spending money and creating a great buying market; never was there sounder prosperity—so runs the tale. And in the industrial productive world it is true. But no production, and hence no prosperity, ever arises from stock-juggling. But the seductive tale runs on—Have you heard about P. and Q.? It's to be put up twenty points. Get aboard.

And then the market does rise. Certainly it rises—because so many buy. And great bankers view the situation with mild alarm.

This is an "unhealthy" condition.

Stocks are bought on margin, with borrowed money: the bankers decide to charge more for that money. Money, they say, is "scarce." When bankers say that, danger threatens the paper fabric which by some is esteemed the national pyramid of wealth.

In a week P. and Q.—considered as a whole—has "shrunk" fifty millions in value. And yet the company owns as much property as ever: it is as prosperous as ever. Market values had nothing to do with industrial values.

Nothing has changed—except—the sucker's bankroll.

He is sadder. It is not all loss if he is only wiser.

And when the Bears have hammered prices down far enough the bankers can step in and buy stocks, at bargain prices, "for investment."

It is again a "healthy" market—for the bankers.

## Plain Talk on the Debts

THE whole question of debt settlement presents an aggravated problem. Our country, right in principle, has been peculiarly unfortunate in method. The matter of debt "collection" is one thing, of debt "acknowledgment" is another. The United States took the "collection" method of securing an acknowledgment. In doing so we have remitted large proportions of principal and interest, we have undertaken to let our taxpayers carry burdens which by no terms of justice can be said to belong to them, and yet we have prejudiced ourselves before the world because of our "collection" methods and emphasis. This must be charged against American officialdom and not against the American public opinion.

American public opinion will not consent to remit debts for the benefit of international financiers. What they are confronted with now is a condition wherein the debt collection goes *directly back to the people of Europe, whereas debt remittance goes no farther than the financiers.* The people will pay in any case. If remittance went back as far as the *people* of Europe, American public sentiment might consider that an important fact.

Americans also protest against paying for the present military establishments of Europe. Any debts we may remit will simply mean that millions belonging to us—because our people bought the bonds that produced the money—will be turned over to arming Europe. It is a strange situation that the people who are disarming America are also the people who favor debt remission which means the greater arming of Europe.

The only sound basis for our position on the debts is this: let the United States flatly take the attitude that these debts are due, and that debtor governments can either accept the honorable position of coming in and acknowledging them, or they can take the dishonorable method of repudiating them. It is purely a question of national honor. The United States should make it clear that we are not "collectors," but we are seeking to know the extent to which honor rules in European governmental affairs, that we may know how to conduct our international affairs in the future.

## They Got Their Letter

IN HIS book, *The Iron Puddler*, Secretary of Labor Davis has this passage:

> "Some men are by nature beavers, and some are rats; yet they all belong to the human race. The people that came to this country in the early days were of the beaver type and they built up America because it was in their nature to build. Then the rat-people began coming here, to house under the roof that others built. And they try to undermine and ruin it because it is in their nature to destroy. They call themselves anarchists."

This is a clear statement of the situation that everybody sees. And any reader would conclude that it meant exactly what it says.

It appears, however, that certain Jews in

the country have called the Secretary of Labor to account, for they read into the term "rat-people" an anti-Semitic reference to their race.

Now it is almost certain that no other race reads into the expression "rat-people" any reference to itself.

It is not on record that any other race in America has attacked the Secretary of Labor for his perfectly true and clear differentiation between the constructive and destructive types in this country. The nation at large always rejoices when a public official shows signs of having his eyes open.

The *Jewish Daily Bulletin*, however, records the fact that complaint was duly made to the Secretary and that, as usual, the official letter was written complimenting the Jews in a way that good taste would prevent any official from complimenting English, Irish, Welsh, Scotch, Belgian, French, German, Scandinavian, Slav or Turk. Even President Coolidge would not have the face to address such complimentary letters to New England Americans as he addresses to Jews. The New Englanders would despise him for it.

But the Jews seem to like that palaver; they know how to draw it forth in official letters; and Secretary of Labor Davis has not disappointed them.

To date, however, no other race in the United States has protested that the Secretary of Labor was referring to it.

## *Let There Be Light*

"NOW children we will cut out figures of a sky with a moon in it," said the kindergarten teacher to her class in a Brooklyn school. Merrily the little hands set to work amid the clatter of baby tongues. Soon the result was submitted to the teacher. Paper skies were cut to represent patchwork squares with the moon and stars drawn in.

"But the sky is a bowl, children," remonstrated the teacher, "and you have drawn sharp angles and square corners."

"No," said the little ones, "it can't be. Look out the window."

She looked and saw. In Lower Manhattan and Brooklyn the sky is a square, triangle or other form of angle filling the space between skyscrapers, elevated railways and bridges.

Now a new era in building comes in. When the height of skyscrapers began to run to twenty-five, thirty, forty and more stories it became plain that they could not rise straight up from the ground. If this were permitted it would only be a question of time before the streets would become gloomy cañons with little or no daylight penetrating to their depths. The building authorities in New York and other modern cities are therefore regulating the character of new buildings in accordance with their height and the width of the street on which they are to be erected. When the skyscraper reaches a certain height there is what is termed a "setback," the floors above this point being set back to admit more light and air to the crowded street below. New buildings will be more pyramidal and irregular in aspect than the old straight-walled edifices. Then little children will know that the sky is something more than a crazy-quilt pattern.

## *Vital Statistics*

ACCORDING to official data of the Soviet government, the Bolsheviki have executed to date:

| | |
|---|---|
| Bishops | 28 |
| Priests | 1,219 |
| Teachers | 6,000 |
| Doctors | 9,000 |
| Officers | 54,000 |
| Soldiers | 260,000 |
| Policemen | 7,000 |
| "Capitalists" | 12,950 |
| Bourgeois | 355,000 |
| Workmen | 193,000 |
| Peasants | 815,000 |

## *"Corrupt and Contented"*

GENERAL BUTLER is exposing conditions as he found them in Philadelphia, but even he can scarcely hope that his revelations will have any effect on that city itself. The memoirs of his private two-year war are enlightening to provincials who heretofore have not realized the inner workings of the political gangs in our large eastern cities. But your Philadelphian will not bat an eyelash; to him it is an old story.

The general charged at crime as he would the enemy, with waving banners and sounding trumpets. Crime, however, does not present a battlefield front. It oozes about, showing here for an instant, or there, and then ducking to appear some other place. Butler made the mistake of assuming that conventional society was against crime, that a police officer, for example, was, by virtue of his very position, an active enemy of crime and criminals. But Butler soon found that crime had powerful friends within his own ranks. He discovered that immutable law of practical politics—that ward leaders and their henchmen are exempt from punishment. He learned the power of privilege. At the first real test of his authority, involving an aristocratic hotel, he was put out of office.

So he writes his reminiscences, setting forth his encounters with Mayor Kendrick, with politicians, with crooks. Nearly two decades ago Lincoln Steffens made his famous characterization of Philadelphia—"corrupt and contented." The appellation still stands.

# Jews Grab Sesqui-Centennial Plums

## Official List Reveals Identity of Concessionaires at Philadelphia's Approaching Exhibition; Light Thrown on Hitherto Mysterious Happenings

AMERICANS back west, whose patriotism is being challenged to support the Sesqui-Centennial Exposition which is to be held one of these days in Philadelphia, may be interested in knowing certain details of its management that do not ordinarily get into print. These details are available now only because some of those who were reaching for profits reached too far, and stumbled.

As everybody knows, a very large share of the income of any exposition or world's fair is obtained from the sale of concessions. General admission tickets may run into large totals, but they represent only a small percentage of the amounts spent by visitors. Or, to state it in the highly descriptive phrase—"One price to get in and twenty to get out."

***What About the Main Group of Concessionaires?***

Just now it is impossible to do more than estimate how many nickel, dime, quarter and dollar hunters will be on the job when the exposition really opens, because that important business detail has been in a state of turmoil for three months. It is possible, however, to reveal the identities of the main group of concession holders—the persons who expect to profit from the celebration of the 150th anniversary of American independence.

C. F. Rhodes, president and general manager of the Rhodes Amusement Company, unwittingly brought about the publication of this list. First, the enterprising Mr. Rhodes obtained for his own company the right to operate most of the big scenic railway and similar amusement devices at the exposition. Then, according to the Pennsylvania Bureau of Securities, he issued a million shares of stock at a dollar a share, and paid himself 250,000 shares in return for the concessions.

If Mr. Rhodes had used better judgment at that point he might have been saved much trouble. But he did not use good judgment. He began to sell stock, and he sold some of it in Pennsylvania without going through what he considered the formality of a permit from the Securities Bureau. A few days later (this was back in October of 1925) he was notified by the bureau to stop selling stock and ordered to come to Harrisburg. At the same time Einar Barfod, chief deputy of the bureau, made public the facts then in his possession.

A word here about Barfod might be appropriate. He is a former newspaperman whose specialty was the ferreting out of shady financial transactions. His reputation was so great, indeed, that when Gifford Pinchot went to Harrisburg as Governor, he took Barfod along.

Rhodes went to Harrisburg and put in an application for a permit. He also had a long conference with Barfod. At the conclusion of this meeting Barfod issued a statement to the newspapers announcing that Rhodes said he needed stock to bribe politicians. Barfod also accused Rhodes of offering to show him how to make some "easy money." And at the same time Barfod announced that in spite of the political pressure and the specious "patriotic" appeal, the Rhodes request for a permit to sell his stock had been flatly refused.

***There Have Been Charges and Countercharges***

Charges and countercharges followed, and then identities began to get into the public prints. The name of William Abrahams appeared most prominently.

Mr. Abrahams, it appeared, was director of concessions.

Mr. Abrahams had issued all the prize concessions to Mr. Rhodes.

It also developed that Mr. Abrahams had been named to that post by his bosom friend, Mayor W. Freeland Kendrick, of Philadelphia, and that the executive committee of the Sesqui-Centennial Association had been told to follow a policy of "hands off Abrahams."

Rhodes blustered—and took an appeal to the courts from the decision of the Securities Bureau. While that was pending *several nationally known business concerns announced that they had withdrawn from any attempt to participate in the Sesqui-Centennial because of the strange proposals made to them.*

***Colonel Collier Makes an Announcement***

The L. A. Thompson Scenic Railway Company demanded and obtained the return of a $5,000 deposit. An official of the concern said that *concession holders were expected to buy their lumber from a certain firm,* to wit—M. Zussman & Sons.

By the time the courts upheld Barfod and the Securities Bureau and finally blocked the sale of Rhodes stock the lid was completely off.

The Charles E. Hires Company announced that a city official had attempted to get a large commission in return for a concession.

Other firms asserted that everybody getting a concession had to agree to take so much advertising space in a daily Sesqui magazine.

And then Colonel David C. Collier, director general of the exposition—the man who made the San Diego Exposition a success—washed his hands of the whole affair.

Mayor Kendrick started what he called a "reorganization." Colonel Collier resigned when the mayor announced that the program must be reduced from $12,000,000 to $3,000,000.

*Immediately after Collier resigned the mayor revised the program upward again.*

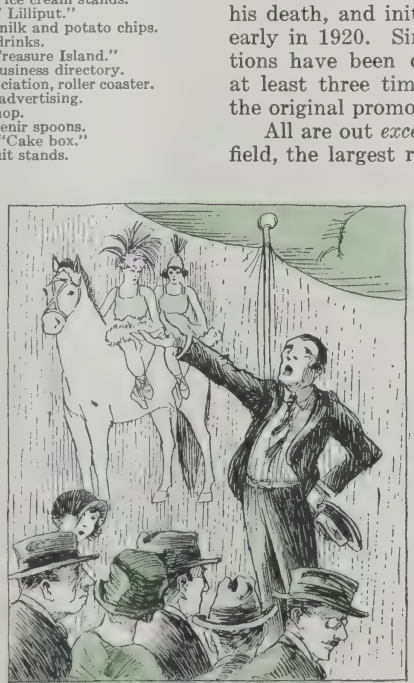
In the meantime, however, he named a committee of prominent business men to take charge of concessions, and a firm of public accountants was named to investigate Abrahams' accounts. Several of the business men refused at first to serve, but the mayor talked them into it. Abrahams retained the title of director of concessions.

The committee remained in office only a short time, but its members performed one great public service. They made public the following list of concessions granted by Abrahams:

Timothy J. McCoy, last Great Indian Council.
M. Blume and I. Bleiweiss—pre-exposition lunch stand.
Breyer Ice Cream Company.
W. M. Levin and S. Garman, two pre-exposition lunch stands.
J. D. Cardinell, official sale, view books and post cards.
Ella Schooley, "Ask me" restaurant.
Joseph Mendelsohn, checking privilege.
J. W. Kelchner, "King Solomon's Temple."
C. F. Rhodes, "Old Vienna," "Water Carnival," "Old Plantation," "Hawaiian Village," and riding devices.
A. Poland and H. Jablonsky, two fruit stands on Gladway.
Max Smith, "Irish Village."
E. V. Dougherty, Jr., "Skooter."
I. Rudolph, sale of novelties.
National Business Shows—weighing machines.
National Highway Association—official maps.
M. A. Sursock, "Through the Orient."
J. C. Pizagno, peanuts.
S. Folkman, popcorn.
Walters, Inc., sale of sandwiches.
S. W. Oplinger, souvenir pictorial book of exposition.
J. L. Kreugel and M. Lindenbaum, candy in imitation of meat, fruit, etc.
Louis Burk, Inc., sausages.
National Souvenir Co., official key souvenir.
Centennial Pretzel Company, exclusive pretzel rights.
Felt Brothers, "Old Philadelphia."
M. Rothschild, sale of optical goods.
C. D. Lawes, fruit and vegetable knives.
Novelty Sales Company, "Fun Shop."
William Akers, Jr., glassware.
F. L. Talbot and E. Kracht, launches and gondolas.
T. Kozai, Japanese village.
Franklin Cushion and Drapery Company, "Betsy Ross art shop."
Ad-Lane Advertising Corporation.
H. F. Maynes, amusement rides.
W. F. Wunder, amusement rides.
Centennial Souvenir Manufacturing Co., novelties.
Sesqui Badge and Novelty Company.
Eastern Novelty Company.
High Art and Photo Company.
Wunder and Hassen, shooting gallery, "Rocky Road to Dublin," "House of Mirth," amusement ride.
Fred Rosenblum, twelve ice cream stands.
Harry Sharp, "Village of Lilliput."
Harry Robinson, buttermilk and potato chips.
Ludo Corporation, soft drinks.
Major E. A. Belcher, "Treasure Island."
W. D. Vallette, handy business directory.
Rhodes Amusement Association, roller coaster.
Sesquicentennial Poster advertising.
Paul Dreher, lapidary shop.
Robbins Company, souvenir spoons.
Witsky and Crachman, "Cake box."
Samuel Gorberg, two fruit stands.
Wunder and Hassen, motordrome.
F. L. Talbot and J. S. Baughman, "Fire and Flame."
I. Grossman, souvenirs and medals.
Louis M. Hinden, candy.
Beechnut Packing Company.
Colonial Ice Cream Company.
Quaker Ice Cream Company.
Alexander Seitz, souvenir booklet.
Claude D. Lawes, Louis musical concession.
Louis Mark, shoes, hosiery and accessories.

Since that list was made public the concessions committee has resigned and William E. Cash has been placed in charge of concessions, but William Abrahams still holds the title of director of concessions, and still attends meetings of the executive committee with his friend the mayor. The program for the exposition has been contracted and then expanded. A proposal has been made to postpone it until 1927, and turned down.

*Not a single one of the great powers of Europe has arranged to have official representation at the exposition.*



Several of the smaller countries have agreed to make displays, but some which originally made such plans have withdrawn since because of the uncertainty as to time and scope. Spain is the only nation officially represented at the time of this writing. Various industries of England, France and Germany will have exhibits, but official participation is lacking.

An effort was made to get from the United States Treasury more than $4,000,000, but President Coolidge thought the demand exorbitant.

An appropriation of $2,186,000 finally was obtained, but Congress took care that none of it should fall into the hands of Philadelphia politicians by a provision that the money is to be expended through the National Advisory Committee.

The Sesqui idea was launched by John Wanamaker many years before his death, and initial steps were taken early in 1920. Since then administrations have been changed as a whole at least three times, and virtually all the original promoters are out.

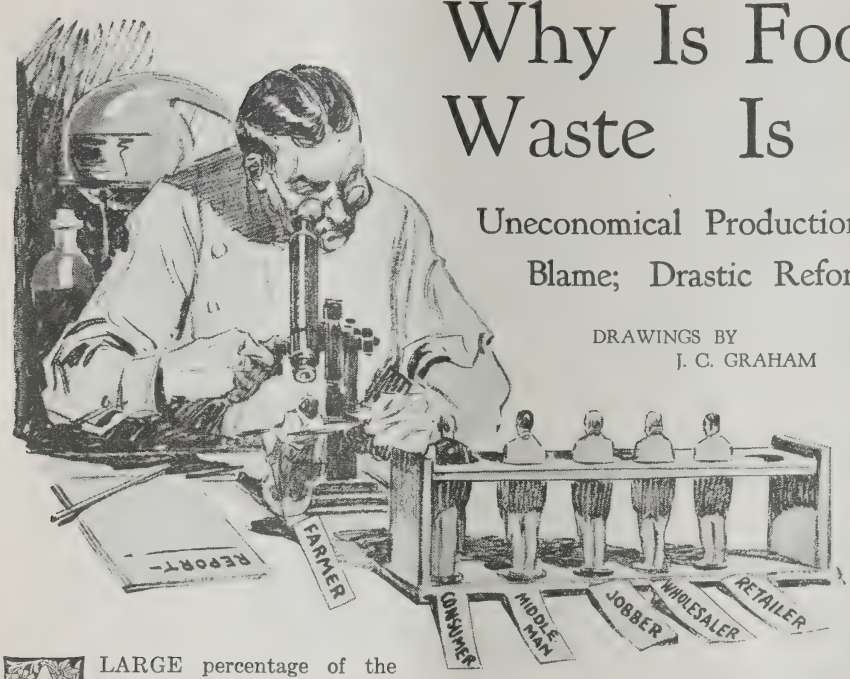
All are out *except* Albert M. Greenfield, the largest real estate speculator in Philadelphia, who is chairman of the Finance Committee, the Mastbaums and the Gimbels and other patriotic Americans.

Similar changes have taken place in the site. Originally it was located northwest of City Hall along the Parkway leading to Fairmount Park. Samuel M. Vauclain and other manufacturers killed this project by proving that *it was a real estate speculation which had doubled the prices of workmen's homes.*

The shift to the present location in South Philadelphia was a stroke of genius—for the speculators. Glance at a map of Philadelphia and you will see that the central city lies between two rivers, the Delaware and the Schuylkill. Just below the city these rivers join. At the junction is the Philadelphia Navy Yard. Between the junction and the built-up section are thousands of acres of marsh ground. The work of filling it up with good soil to make a site for the exposition is proceeding apace. Of course, this land will eventually be sold for real estate purposes. A future buyer, who may or may not be known, will be the beneficiary of all this production of real estate values.

A $2,000,000 stadium is nearing completion on the site, but the other buildings planned are nowhere near completion, and some have not even been started. A short time ago it was discovered that another $1,000,000 would be needed to complete the stadium, and City Council shelled out the money despite a lone protest from Councilman Roper, the lone independent on that body. The protest brought out the fact that, including appropriation and contributions, Philadelphians have invested about $9,000,000 to date.

From an engineering point of view the sensible thing would be to postpone the celebration until 1927. But from the political point of view that does not interest the mayor and his friends. Kendrick's term in office expires with 1927. If the exposition can be held this year, all of 1927 will be available for the disposal of the exposition property. The land is being filled in at public expense. Roads will be put through in the same manner.



At this writing the exposition is not even assured of participation by all the states. The program has been changed so often that the average Philadelphian following the developments in the daily newspapers does not even know how many buildings are to be built, and there is a general belief that with most of the work still to be done it will be impossible to get the place ready by June 1, the opening date. Perhaps that explains the apathy in the United States which is complained of by agents of the Sesqui-Centennial.

# Why Is Food So High? Waste Is Responsible

## Uneconomical Production Methods Are Largely to Blame; Drastic Reforms Needed on Farms

DRAWINGS BY
J. C. GRAHAM

By
ROBERT STEWART

A LARGE percentage of the income of the average American family is spent for food. The annual value of food consumed in America is twenty-three billion dollars. This, of course, includes the actual cost of producing the food on the farms, plus transportation, waste, expense and profits of getting the food to the consumer's table.

The farmer and his family, who produce the food, use four billion dollars' worth on the farm; four billion more represents the value of food consumed in hotels and restaurants; while fifteen billion dollars' worth is disposed of in the city homes.

*City People Pay More for Their Food*

The city people pay considerably more for their food than do the farm people. Actually they pay about two and one-third times as much as rural residents. Why is this so?

The average American family's food bill is $611.44 annually, the city family's food bill is $824.27, while the farmer's family food bill is only $374.82. Yet the farmer's family eat more food to the meal than do the hard-pressed city dwellers.

During the last five years newspapers, magazines and public speakers have been discussing and reporting acute distress among farmers due to the low prices received for their products. It is asserted that more than one million farmers left the farm last year because of low prices, resulting in financial failure.

The consumer of food in the city, hard pressed to make ends meet, has not seen any evidence of cheaper food.

Why is there such acute distress among the producers of food as to cause more than a million men to quit the business while the consumer has difficulty finding the necessary money to buy this food?

With such conditions there is fertile ground for misunderstanding. The consumer is apt to blame the farmer for charging exorbitant prices. The farmer is liable to feel that the consumers in the cities are organized against him.

The middlemen, the jobbers, the wholesalers and retailers come in for their share of blame and abuse. The farmer is urged to form coöperative marketing associations. The consumer fears these associations are holdup organizations whose prime purpose is the fixing of exorbitant prices. The middlemen are told that one of the purposes of the farmers' coöperative marketing associations is to eliminate them and sell farm products directly to the consumer. What is the truth? Why is the price of food so high?

There are various ways in which economic waste occurs in the production, transportation and marketing of food which, if they were allowed in any other industry, would wreck it. What is ordinarily thought of as waste, such as loss from decayed fruit and vegetables, is a small item compared with other more important wastes which occur all along the line.

*"Not Farming; It Is Merely Wheat Growing"*

There is marked economic waste in time and labor in the production of many farm crops. The maximum labor period for the production of a crop of wheat or barley is about 120 days, this, however, being a fluctuating period depending upon the climatic conditions of the season and the energy of the individual farmer. There are 365 days in a year; there are 52 Sundays and three general holidays. The single-crop wheat-farmer must, therefore, be idle about 190 days out of the year.

A similar condition prevails in the production of cotton and in many cases with the production of rice and alfalfa. On some of the Government reclamation projects many of the farmers are in real distress. Yet ninety per cent of the entire area on some of these projects is planted to alfalfa, and the farmer of necessity must be idle three-fourths of his time.

John Fields, a practical farmer of Oklahoma, says in this connection:

"Working four months of the year putting out and harvesting a crop of wheat, then sitting by the other eight months wondering how we will live, is not farming; it is merely wheat growing. The wheat-farmer must go to farming. Regular production, growing something every month in the year, is the solution of the wheat-farmer. Even the Government cannot save the one-crop farmer."

*Farms Which Had No Milch Cows*

A survey in Kansas in 1920 showed that in this great wheat state there were 165,286 farms the average size of which was 274.8 acres. On 54,152 farms there were no milch cows, while on 74,380 farms there were no beef cattle. On 104,153 farms there were no beef cows two years old or older. No fewer than 48,999 farmers bought all their salt-pork, bacon and ham. On 42,434 farms there were no sows or gilts for breeding purposes. On 28,600 farms there were no eggs or poultry produced for sale, while 41,611 farms were without gardens. These were the single-crop wheat farms. All this adds to the high cost of production.

Such farmers must reorganize their work, as the manufacturer has done, so as to obtain all-the-year-round production and thus eliminate this element of waste. This is one of the great advantages of diversified farming.

The waste occurring in the production of food from insect pests and plant diseases amounts to enormous sums each year. A large part of this waste could be eliminated by careful work on the part of the farmer.

In a single year the "late blight" of the potato caused an estimated loss of $10,000,000 to the farmers of New York State alone, and probably $100,000,000 loss to the potato growers of the United States. Yet this disease and this loss

can be eliminated by efficient spraying of the potato plant with Bordeaux mixture. There are twenty-two diseases and fifteen insect pests affecting the potato plant alone.

The annual loss from smut or bunt in wheat is estimated at twenty-five million dollars. Yet, this disease can easily and effectively be prevented by the simple copper carbonate dust treatment of the seed wheat, which has proved to be thoroughly effective.

Poisonous plants take an enormous toll every year from the livestock men. In the national forest alone it is estimated that 6,000 cattle and 15,000 sheep are annually killed from eating them. Yet, the facts relative to the economic control and elimination of this waste are known, and proper precautions would result in a large saving to the stockmen who use the national forests and public range for grazing.

***There Is Waste in Farming Poor Land***

There is also waste in farming poor land. Some of this, such as hill land, should not be farmed at all, but should be allowed to go back into sod or forest. Tremendous waste results in farming poor land that is badly in need of drainage. Land water-logged or heavily charged with alkali salts produces poor crops with a high cost of production. Yet large areas of land under irrigation are heavily impregnated with alkali and badly in need of drainage. In humid regions there are vast areas of land which are so badly water-logged that only poor yields are possible at an excessive cost of production.

Soil erosion is another important way in which waste occurs in food production. It is estimated that more than ten million acres of land have been ruined by wrong systems of farming through which soil erosion has been promoted. Land which is depleted in humus and plowed in the wrong way is subject to soil erosion, especially if it is sloping land on a hillside.

Thousands of acres of land in the Northeastern United States are being used for cropping which should never have been used for any other purpose than sod pasture or tree production. It should be allowed to revert to its native state. Its use for pasture and trees would be more economic than its use for cropping purposes.

Much land in the United States has been cropped so long and persistently that it is depleted of its readily available plant food. It is being farmed at a high cost of production. It should be built up to a system of soil fertility by the scientific use of limestone, manure, legumes, and commercial plant food. Such practices would result in higher yields, with greater profit to the farmer and lower prices to the consumer.

The economic merchandising of the crop produced by the farmer is of course very important, but it is useless for the farmer and consumer to rave about the system of marketing if the crop is produced at such a high cost as to prohibit a profit at any possible market price the consumer can pay.

There is a tremendous amount of waste in the marketing of the food products of the farm. It is the common practice to place all the blame for our present inefficient marketing system on the middlemen. Really, however, a large part of the blame should be placed on the farmer himself, who has the power to eliminate much of the preventable waste in marketing of food products. The consumer also is culpable because of his demands and unscientific methods of purchasing food on the market.

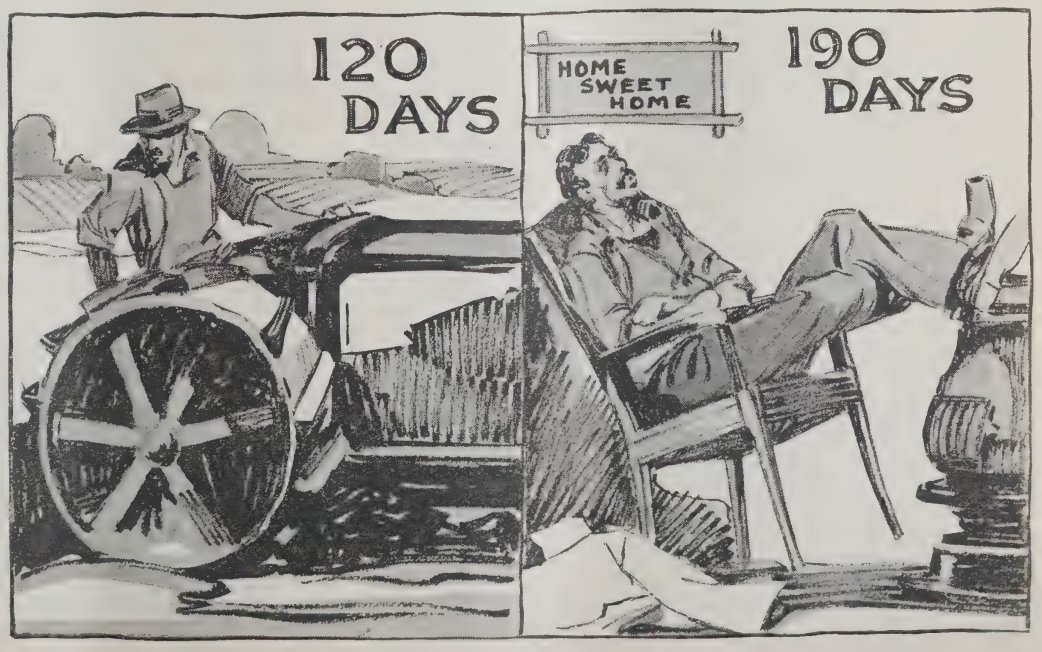
***Transportation Costs Are Considerable***

Recent investigations at the Port of New York gave interesting side lights on the distribution of the cost of food received through that port. A box of Oregon apples cost the consumer $5.09 in New York. The grower in Oregon received only $1.19 and the retailer's portion was more than the producer's. The transportation costs were $0.78, the wholesaler received $0.43, while the jobber received $0.53 and the shipping organization in Oregon received $0.26.

A study of fourteen other kinds of food products in New York showed that 47 per cent of the consumer's money goes to the retailer and jobber.

The terminal handling and cartage costs are equal to about ten per cent of the retail price—in the case of Oregon apples, $0.59.

It costs $0.42 to haul a sack of potatoes weighing 150 pounds, 1,120 miles to the terminal in New York, yet it costs $0.62 to haul this same sack a distance of 15 miles from the terminal to the retailer. The first transportation cost is at the rate of .04 cents per mile, while the latter is at the rate of 4 cents per mile. It also costs $0.17 per sack of potatoes for use of switch engines, ferries and unloading.



***Much Waste Could Be Eliminated***

The food is unloaded at the ferry, loaded on a horse truck and moved 500 yards to a motor truck at a cost of 12½ cents per barrel of apples. The apples are delivered to the jobber, unloaded again and again loaded and delivered to the retailer at a cost of 15 cents to 35 cents per barrel.

Much of this excessive cost or waste could be eliminated with better designing of terminals and better routing and planning of operations.

There is, for example, much waste in the use of trucks for transportation. In every 100 hours of truck service actually paid for by *the consumer*, there is only 36 hours of actual productive service. Delay at the terminal accounts for 29 hours, while the trucks are idle 35 hours out of every hundred. That is, out of every $1.00 paid for truck service only 26 cents is for actual service, profit takes 14 per cent and waste the rest. And the consumer pays the bill.

There is also waste from actually spoiled fruit and (Concluded on page 29)

# Do You Know About Your Fiddle?

Stainer (1670)

Amati (1645)

Two of the makes more commonly seen today. These are quite high in their model and have a sort of rotund effect.

## Some People May Have Violins for Years and Still Be Unacquainted With Them

By CLYDE WIER

FEW people know what a fiddle really looks like. The usual concert audience is indifferently aware of its general outline, but its curves and swells, its hollows and arches, its poignant corners and deftly swung sound holes make little appeal to the many, whatever casual attraction they may exert on the few. Even those who are mildly interested in the instrument, the amateurs who own and play one, have little feeling for its beauty, and scant discrimination for the differences in specimens or types.

When the great virtuoso steps out on the stage, his fiddle under his left arm and his bow held lightly in his right hand, few regard either the fiddle or the bow. The one may be worth a mansion in the metropolis and the other a high-grade automobile, but little the audience cares. The player himself has to face a more or less critical inspection; the cut of his coat, the pitch of his tie, the swell of his shirt front, his crop of hair, draw brief casual comment, but for his instrument he need feel not the slightest anxiety. A few might note that it was brown, while a few others might fancy that it was red. Beyond that it would attract no attention. At the bottom of the program the auditor might be reminded that the piano used was a Steinway, but whether the artist of the evening plays a Stradivari, a Guarneri, or an Amati, worries no one.

To be sure we read occasionally in the press a notice that Heifetz has brought home a $50,000 Guarneri, or that Elman has added an equally valuable Stradivari to his collection, to be a mate to the younger and cheaper specimen by the same hand, but on such subjects all programs are strangely silent. The chestnut brown of Kreisler's Strad, lit here and there by a smouldering glow of red, is as unnoticed as Elman's, with its brighter, quince jelly hue. Nor does the noble Guarnerius that sings so beautifully for Albert Spaulding attract any attention, although its back seems gowned in gorgeous flaming red velvet and its darker top would make a connoisseur cry out in ecstasy. Yet everyone knows that these men play on very choice instruments for which they have paid years in seeking and fortunes in purchase money.

Perhaps the audience is wholly uninterested in the fiddle itself; or it may be that shrouded about the fiddle is a certain mystery that folds it away from the world at large—a veil that is lifted for those only who have the desire and the determination to peer within.

And there is a mystery that shrouds the fiddle, just as for the uninitiated there is a mystery that shrouds all art. Yet the mystery of the fiddle is no greater than the mystery of a painting or a statue; and to penetrate the fiddle mystery demands much less technical knowledge. An eye for wood, a sense of form, an appreciation of color—these will take one well along through the ritual of initiation, and although the neophyte will still have much to learn, he will find it a joyous process.

He must learn
st that every fiddle
ffers from every
her fiddle just as
ne individual differs
om all other in-
viduals. To learn
is often requires
ore time than the
initiated might
elieve.

On the casual ob-
erver's mind two impressions stamp
nemselves almost simultaneously: a
eneral idea of fiddle shape, and a
ather hazy idea of wood; and it is
erhaps the latter that arouses the
ore definite interest. Such details as
he peculiarity of the outline, the
radations of the arching, the shape
nd position of the sound holes, the
wing of the scroll, the "set" of the
D's," the height of the ribs, the color
f the varnish, make no appeal to the
ovice. He merely recognizes the con-
entional fiddle shape, which he dimly
eels has been in some way moulded or
ressed into its form; and he is more-
ver aware that the wood is interesting,
not familiar.

That he does not actually identify
he wood is shown by the fact that one
f his first questions will concern it.
He is aware that the top has a grain
hat might easily split, and that the
ack is rather highly figured. But he
s quite apt to think that this figure is
ainted, and not natural.

Violins are usually made of two
inds of wood: a soft, straight-grained
ood—pine, spruce, balsam—for the
ops, and a hard, highly figured wood—
naple, sycamore, or even beech—for
he back, sides, neck, and head. The
nner blocks and linings are usually of
ine, but such wood
s cedar or basswood
erves as well. All
he wood except that
or the linings, blocks,
ar, and so on, is cut
n the quarter. This
ives for the top the
arallel arrangement
f the grain, which
nhances the tone;
nd for the back a
ore striking appear-
nce, at least.

In the olden days
iddle backs were
ometimes cut on the
lab, but in all my
xperience with lit-
rally hundreds of
iddles, I have seen
ut one, a 'cello, with
op cut in this man-
er. This was the
ork of a reputable
talian, and was once
he solo instrument
f Philip Abbas, prin-
ipal 'cellist of the
Detroit Symphony
Orchestra. Its ap-
earance was very unusual, but its tone, though good, was not the most desirable in such an instrument. Experimenters, of course, have tried all sorts of wood, some even essaying metal, but there is little danger that the usual kinds will be set aside for others. The matter of difference in the fiddle family is one of size, outline, arching, sound holes, "D's" (those depressions that give the instrument a sort of accentuated waistline), the form of the peg box, the swing of the scroll, the button (that prolongation of the back upon the lower part of the neck where it is set into the body of the instrument), and the height of the ribs or sides. This is a formidable array in itself. Now add to this the variation in wood, its grain, its texture, the great difference between the appearance of that of the top and that of the back and sides, and your list of preliminary points of interest is nearly complete. Only the variation in the color and quality of the varnish is needed to give you food for thought sufficient to satisfy the hunger of years and years.

Let us first consider the matter of size and outline. The violin is divided into an upper and lower bout, the size and shape of which every maker of note has varied somewhat to satisfy his own taste. To the indifferent, this variation is scarcely apparent, for in actual measurement it is not great. The extreme length of body is seldom more than 14½ inches nor less than 13½ inches. There is scarcely that proportionate difference in the width of the upper and lower bouts.

Guarnerius (1733) and, above, right, Stradivari (1700), two famous makes which seem lower than they actually are.

But between the works of the various makers from the middle sixteenth century onward, there is always some difference, easily discernible to the expert, but usually unnoticed by the amateur who has not had his attention called to the fact. Take a half-dozen specimens and put them side by side on a table or bed and look at them critically, and you will soon become aware that they differ just as so many men differ who are of about the same height, measurements, and weight. One seems slender and tall, another short and thick, another somewhat stooped—all different, although this difference is not indicated by the tape.

Look now at the archings. They present much greater variation than do the lateral and longitudinal dimensions. Of the four makes more commonly seen today, two are high and two are low. The Stainer and Amati instruments, made between 1625 and 1675, are

quite high in their model, or patron, as the French call it. This height is accentuated by the fact that the top and back of both seem to dip at the edge before the arch begins to rise. Most of the copyists have greatly augmented this rise, thus giving the instrument an ungainly depth of body.

The Stradivari and Guarneri instruments, on the other hand, which are the acme of the fiddle-maker's art, are much lower in their arching, and as their arch does not dip before it begins to rise, they seem flatter than they actually are. Between these two types there is every possible variety, but most specimens can readily be classed in one or the other. The French copyists have a trick of overrefining the fine points in Italian workmanship in the matter of arch and subtle curves, while the Germans are more apt to overlook them. The result is, the French workmanship is too meticulously fine to be very artistic, while the German is too suggestive of the wholesale commercial product.

In our scrutiny of the top and back we must be sure to examine the "D's," for they appear in as many varieties as there have been individual makers. Some seem perfectly proportioned to fit the particular specimen; they appear to have grown in their place rather than to have been cut and trimmed to their proper proportions. Others are constricted, or too long, or otherwise deformed. Some swing in and out with almost the contour of the arc of a circle, and others drop, after the turn of the corner, in almost a perpendicular line. Some, like the Amati and the Guarneri, swing wide at the bottom in such a manner as to be congruous with the increasing size of the lower bout, while others are as perfectly balanced as a curved bow when the arrow has been drawn nearly to the head.

*Characteristics of the Best Instruments*

They are all such subtle things that the very slightest cutting away of the wood at any particular point is enough to change their whole aspect. This accounts in part for the many varieties, some of which are due rather to chance than to design.

Glancing inward from the "D's," we catch sight of the sound holes, or *ff* holes, as the fiddle fan calls them. These are the most characteristic trait of the fiddle. Each maker invented his own design, and many of the older masters so changed the outline as the years went by that experts have come now to group certain makers' instruments into periods limited by the changes in the patterns of these openings. There is nothing more beautiful when done by a master, and nothing that betrays more positively the work of the inexpert or the inartistic. They are of all sizes and shapes: some are too long, some too short, some too wide, some too narrow, some too curved, some too straight and angular, some with wide terminal wings, and some with no terminal wings at all. Some are set too perpendicularly, and some at too great an angle, some too near the edge and some too far away, some too high up in the body and some too low.

There are some few just as Stradivari intended them to be. These are difficult to describe. By seeing them often one may learn to appreciate them, but on the casual observer their beauty is all too often wasted. Many of the finest have suffered from the ravages of brutal repairers who try to improve perfection. A few rubs of the file and the work is done, the damage irreparable.

The peg box and the scroll constitute what is called the head of the fiddle. In point of interest they are close rivals of the *ff* holes, insomuch as they are very characteristic of their makers, each carving his own with as much care as he takes in moulding the archings and adjusting the thicknesses of top and back.

A fine peg box is narrow at the top, just beneath the scroll, spreading apart as it approaches the neck, where it is perceptibly wider. (The average commercial scroll of today, made by European girls for the fiddle-makers' mart, resembles rather a miniature watering trough for Lilliputian horses.) Above the peg box hangs the scroll, which in itself is a great work of art. The width of the "ears," the swing of the volute, and the poise of the whole, constitute one of the greatest triumphs of the fiddle-maker's art. The study of this alone is a matter of years, but years well spent, if the student learns to recognize at a glance the genuine Stradivari, or Guarneri, or the more subtle types of the Amati and the Ruggeri families.

Glancing up the back of the fiddle we perceive the button, that little rounded projection of the back that seems to be reaching up to clasp the neck where it is set into the body of the instrument. It adds perceptibly to the rigidity of the neck, and serves also as a sort of maker's calling card, as it is highly individual. At its best, it is a miniature reproduction of the upper bout of the back. The great makers wrought it with infinite care, each making it harmonize perfectly with the body. But here too the unscrupulous maker or repairer has often wrought ruin. For often, when removing the old neck to set a new one, he breaks off the button, or in setting the neck he works too hastily with his file. The result is always mutilation. Sometimes to repair the harm he has done he fits a half-moon of ebony around the edge of the injured button. This merely adds insult to injury, and the marks of such insults appear with pathetic frequency on the backs of many a fine old masterpiece.

The height of the ribs varies in the different types, the higher archings having often lower ribs than the flatter instruments. For the average instrument a fifty-cent piece is a convenient measure of the distance between the top and the back. This distance should never be greater, and often it is less. The ribs are often a little lower at the upper bout than at the lower, but the modern makers are coming to disregard this difference. In violoncellos the difference is proportionately much more variable than in violins or violas.

This brings us to the last and most important question of all, that of varnish, at once the delight and the despair of all lovers of the violin. Insomuch as it has always puzzled the greatest experts, it needs here but superficial treatment. The varnish gives that beautiful finish that is not the least charm of the instrument, and it is reputed to make for tone or the ruin of tone, depending on its quality. If it has the elasticity and the pliability of the ideal varnish, it glorifies the tone; whereas if it has the texture of the conventional modern product it either constricts the tone or gives it a trumpet-like blare so dear to dispensers of jazz.

*Learning to Distinguish Good From Bad*

The novice will find that to appreciate the old and the best he will have to be very attentive to the comment of those who know, and sedulous in his own observations. He should examine as many fine specimens as possible, even if he has to make long trips to do so. The sight of a fine Italian fiddle is well worth, to the fiddle lover, a trip thousand miles. In time he learns to aside without comment those glassy-look furniture-like offerings of the Germans crowd our shops, and refuse to be tempte the scaly-looking, under-filled, artifici dulled merchandise that the French gorge by shiploads on our markets.

There will be left the reputable ins ments, not so loud in their appeal, but more satisfying to the eye. The very qu ness of the color is one of the indication a good instrument. The varnish does seem so much a finish as a condition; reminds one rather of the color and text of the human skin—not an external appli tion, but a natural growth.

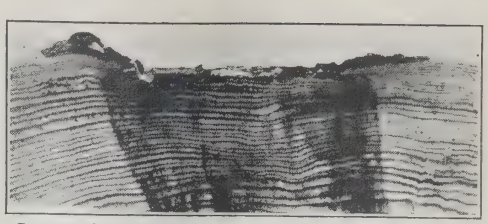
With good advice and good luck may learn approximately to recognize general differences between Italian inst ments and the imitations by English, Fren German, and American makers; but whole problem is so great that there little hope for its solution by the avera amateur or even professional.

## Things in the Making

THE use of metallic lead for marking of very ancient origin. Pliny refers the use of lead for marking lines on papyr and Cortes, in 1520, found the Aztecs usi lead crayons.

Graphite pencils were made in Engla in 1564. The graphite was so highly priz that a guard of armed men was kept arou the mine at all times, and to keep up t value of the product, the mine was work only six weeks in a year.

The modern lead pencil is a stick graphite which has been mixed with cla and surrounded by a case of wood. Flori red cedar is chiefly used in this country a in Europe.



The first process in making a lead pen is to grind the graphite very finely. It then cleaned and refined and a quantity finely powdered clay is added. If a ha lead pencil is wanted, a larger amount clay is added. If a soft one, a less amou The mixing is done by machinery, and wh completed, the soft, mushy material forced through dies, under great pressure, varying degrees of size. This process is r peated a number of times, until the graphi comes out in long strings of the prop consistency, after which it is then straigh ened, cut into lengths of about thr feet, and allowed to dry. Later it cut to proper length, usually about seve inches. The hardening process must gone through and the graphite al made absolutely free from water. This done by packing it in crucibles, which a burned for several hours. If other than black color is desired, the coloring of th leads is done by the introduction of variou pigments when the graphite is being mixe

Pieces of the wood, of sufficient widt to make two, four or six pencils, are pu through a machine, which cuts out a sem circular groove the diameter of the penci The lead is then placed in these groove and another piece of wood of the same siz as the other, also with a groove in it, glued to the first.

After being dried under pressure, the are sent to the turning room, and rounde squared, or made octagonal.

The polishing is done on lathes, an the coloring by a machine which holds th brush and turns the pencils fed to it throug a hopper.

# Why the Lightning Strikes the Trees.

Cross section of superficial lightning wound on a western yellow pine. Tonto, Arizona.

## ove's Thunderbolts Observed and Their Behavior Described by Scientists of the Federal Forest Service

IT HAS often been stated that the majority of persons killed by lightning sought refuge under trees, but this is not the fact. lore than one-half of such deaths occur in the pen and less than one-quarter under trees.

Trees are the objects most often struck y lightning because:

They are very numerous;

As a part of the ground they extend pward and shorten the distance to a cloud;

Their spreading branches in the air and preading roots in the ground present an xcellent form of conducting electrical dis- harges to the earth.

The greatest number of trees struck in ny locality will be of the dominant species. he likelihood of a tree being struck by ghtning is increased:

If it is taller than surrounding trees; olated upon high ground; deeply rooted; nd if it is the best conductor at the moment f the flash; that is, if temporary conditions uch as being wet by rain transforms it or the moment from a poor conductor to good one.

A heavy driving rain, such as accompanies he average thunderstorm, can so wet any ree that it will for the time being become an excellent conductor. Up to that time the tree might have been in itself a poor conductor.

estern yellow pine struck lightning. Angeles ational Forest, California.

Thus, though the moisture content of wood, particularly within the outermost layer of growth in a living tree, adds to the variability of induction, even the most resinous of trees with lowest moisture content can under a heavy rain become a splendid conductor in a moment's time.

Because of this, and the fact that the form of the most efficient lightning rod, with its branches at both ends, resembles that of a tree, it is evident that any kind of a tree is likely to be struck by lightning.

The same flash may strike and blast a number of trees, and the results may be quite as curious and erratic as the lightning itself.

A tree may be scorched, it may be stripped of its leaves, it may be cleft longitudinally or, in rare instances, be severed horizontally.

One-half of a tree's crown may be withered, while the other half remains unharmed. Sometimes the bark is stripped from only one side, occasionally without a trace of burning; at other times it may be riddled, as by worms.

Thirty-six inch Douglas fir burned down by "light-burning fire." Plumas National Forest, California.

The lightning furrow on a tree is usually single, but it may be double, usually in parallel lines. Furrows may be oblique or spiral, the current in such cases following the grain of the new wood.

If the tree is inflammable or is rendered very dry by the heat of the flash, a fire may result. In other cases, the dry duff or humus at the base of the tree is ignited by the flash. *Most forest fires caused by lightning start in the humus.*

The action of lightning in stripping bark from a tree is as yet undetermined. It may be argued that moisture contained along the line of the lightning is instantly converted into superheated steam, or that the water is converted by electrolysis into its component gases.

Strangely enough, a study of the wood immediately in and around a superficial wound produced by a stroke of lightning shows no structural disturbance, such as the rupture of the cell elements.

A flash of lightning upward through the tree from its base acts as an explosive. The trees may then be torn into small fragments, and cases have been recorded where these appeared like a tuft of hemp. If the upward flash is less violent, the trees may be split radially. The tops of trees have been torn off while the lower parts remained uninjured.

Sometimes the lower portion of a tree has been demolished while the upper part has fallen to the ground intact.

Lightning often strikes two or even more times in the same place. Some trees, favorably located for attracting the flash, bear seven or eight scars, all visible, and determined by a stem analysis of the trunk.

It has been contended, though not proved, that big trees in California are repeatedly struck by lightning, and that, although not killed, their leaders are broken and their tops stunted in consequence. The form of the boles and the shape of the crowns of these trees would seem to favor this belief. Although giants, their heights are much less than would be expected from the taper of their boles.

It was also believed that such trees as the oak, more particularly cork oak, had a very bad reputation for attracting lightning, which belief still prevails.

European investigators hold that the cottonwood is most liable to be struck by lightning.

In temperate climates, thunderstorms with lightning occur most commonly during the summer, usually in the afternoon. In the United States they are three or four times more frequent east of the Rocky Mountains than west, with the exception of certain parts of Arizona and New Mexico. Lightning is most frequent in Florida and Illinois.

Throughout the Cordilleran region of the West there are certain areas which, because they have a marked hazard from lightning, are said to be in the "lightning zone." These areas, several hundred of which have been mapped, usually lie in or near national forests.

The tree most frequently struck and ignited in the West is the western yellow pine, which grows in open, park-like stands where the fire hazard is small. Such a tree may be set on fire by lightning and burn for days without the flames spreading to other trees or to the ground. If the ground is free from litter, as is often the case in western yellow pine forests, the chances of the fire spreading are small.

More trees are struck by lightning in a curved strip extending from extreme Southern Utah through Arizona to the White Mountains in Western New Mexico than anywhere else in this country.

This zone includes the Kaibab Plateau, the Grand Cañon and the Black Mesa, and San Francisco and Sevier Mountains in the Colorado Plateau, and a small part of the Zuni Plateau.

Notwithstanding their comparative freedom from fires, all reports indicate that in the Appalachians trees are frequently struck. Chestnuts easily lead in liability to be struck and are closely followed by the oak and pine tree. Yellow poplars are often reported.

Although the Gulf States have the largest number of thunderstorms and, with one exception, the greatest number of trees struck, the fire hazard from lightning is quite small, because of the heavy rains that accompany storms in that region.

## Lloyd George Seeks Power on Land Scheme

(*Concluded from page 5*)

—without being in any way "revolutionary."

To Lloyd George's credit and that of his committee and staff of experts, it must be said that his report (as in the case of the report on coal of a year or so earlier) is most inclusive and comprehensive as to the facts in the problem and that these facts are marshaled strongly in support of his proposed reforms.

The report was put into the form of a green paper-covered book, placed on all the bookstalls of the country and sold at one shilling. This was in addition to the regular sources of Liberal propaganda through central and local associations. Lloyd George himself then took the stump and went up and down the country throwing himself vigorously and earnestly into the campaign in behalf of the adoption of the policy by the Liberal party, incidentally getting it before thousands of people affiliated with the Socialists, the Conservatives and Independents, in addition to Liberals of all factions. Last December the Liberal candidates gave it their approval after several compromises and adjustments. Now it becomes the official policy of the party.

*New Land Program Goes Further Than the Old*

I have said that the policy thus framed by Lloyd George, and which becomes the slogan of the Liberals, bears a striking resemblance to that which he championed in 1909—and afterward repudiated, finding that it brought down upon his head the profound distrust and hatred of the "better classes." Like that earlier policy, it practically recognizes the principle of nationalization of the land, so far as the property of the people in its rental and "unearned increment" of values. In fact the new program goes further than the program of seventeen years ago in that it calls for the taking over of all the land of the country by the government and its retention of a right of supervision of the cultivation of rural lands by its tenant-farmers in small and large holdings alike, depriving the tenant of his lease should his method of running his farm not prove satisfactory to the local land-courts to be set up for this purpose.

The program certainly out-Herods Herod as compared with the land program of the Socialists. No wonder that Philip Snowden, former Labor Chancellor of the Exchequer, "gave Mr. George the glad eye," as Neville Chamberlain expressed it, and voiced approval of his land policy in general terms.

In one particular the Labor party's program shows even greater consideration for the vested interest of the landlords than does that of the Liberals. Both assert unqualifiedly the principle of "compensation" as against "confiscation"; but while Lloyd George's offer is 65 per cent of the present net rentals, the Labor party (through Mr. Snowden) has actually proposed the equivalent of 50 years' purchase of annual rental!

*The Rock on Which Parties May Be Wrecked*

A forecast of the land policy now being incubated by the Conservatives suggests a reversion to that demanded some forty years ago by Jesse Collings, the "farmer M. P." who went up to the House of Commons in his brown woolen smock and corduroy breeches. "Three acres and a cow" was its simple summing up, and this was probably derived from an earlier demand of the enfranchised Negroes in America for "ten acres and a mule." That is to say, Tory wisdom inclines to small holdings and paternal provision of subsidies for the cultivation of arable land, taking $25,000,000 from the taxpayers in the first year, besides state loans to the cultivators for the purchase of a pig or a cow occasionally.

Of course, this recognition of the claim of landholders to compensation, not for improvements but for the bare land, is the rock on which both Liberals and Laborites are bound to split. Its inclusion in their programs flatly contradicts all pretensions to their challenging monopoly, or the vested interests of the country. It would amount simply to the transformation of the landlords into bondlords, enabling them to realize cash for their land on the most favorable terms, and saddling not only their tenants but the entire population with an enormous burden of pensions (for which the landlords have never given any service), increasing the nation's interest-bearing debt to Gargantuan proportions, and enslaving the producing classes to the parasites of Britain in a way that would make the serfdom of feudal times seem paradise in comparison.

One must be naïve indeed to believe that a policy so generous to the possessing classes does not meet with their secret or open favor. They must certainly regard it as the threat of a rosewater revolution. Nothing can be more certain, however, than that the masses of the voters in all parties will be helped by the competition between the three old parties to penetrate their pretense to sincere concern for the farmer and the worker generally. The question "Where is the money coming from to pay the billions of pounds to the bought-out landlords?" is too obvious not to be raised sharply and persistently. It will logically be followed by others, such as: "And what are we going to pay our good money for?" "The land of the nation belongs to the people of the nation—the earth belongs in usufruct to the living—who gave the landlords title to it?"

*Sir Alfred Goes to the Conservative Camp*

The failure of the Laborites, equally with the two older parties, to meet the situation boldly and honestly must sooner or later prove their undoing. As it looks at present, the complete break-up of the Liberal party seems certain; the more conservative members following Sir Alfred Mond into the Unionist camp and the more radical into that of the Labor party. On the issue of the land for the people—without "compensation," the disintegration of the Labor party is already under way.

## Heckling—a Great British Institution

*Concluded from page 8*

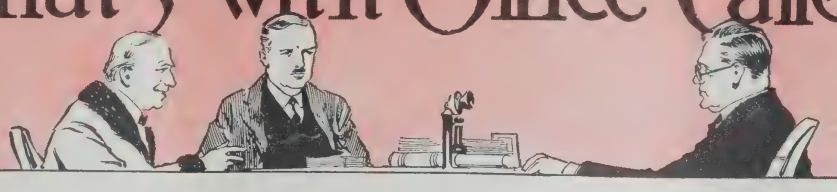
of wit he could recall in the House of Commons was Lord John Russell's reply to Sir Francis Burdett, who had changed his political color from Radical to Tory. Addressing the House he declared that nothing was more odious than the cant of patriotism. Lord John replied that the cant of patriotism was no doubt very odious, but that there was something even more odious and that was the re-cant of patriotism.

Lord Leonard Courtney had a happy way of tackling hecklers, of whom he met many tough ones at Liskeard. Once he was asked: "Is the Honorable member in favor of marriage with a deceased wife's sister?" Lord Courtney, whose charming and accomplished wife was sitting on the platform, said to the heckler: "Are you married?" "Yes." "Has your wife any sisters?" "Yes." "Is your wife here?" "No, if 'er had bin I shudn't ev asked 'e, no fear." "Well, my wife is here and she has sisters, so I don't propose to answer you."

*One Time When Ben Butler Scored a Point*

The unterrified British elector never fails to score with an interruption if the speaker presents a fair opening and if the interjected remark be somewhat rude, so much the better. At the end of a long-winded speech a candidate was proceeding to say, "Mr. Chairman, I have lived long enough——" "You are right, old man" was the observation offered by a member of the audience amid a storm of laughter.

Although heckling does not seem to flourish in America there have nevertheless been instances of native politicians who delighted in it. The late "Billie" Mason, former United States Senator and later Congressman-at-large from Illinois never failed to score when interrupted. Once when making a speech in New York City, a man in the audience greeted a statement with, "That is a lie." Mason paused a moment and looking intently toward the interrupter observed, "I recognize the gentlemen's breath but I can't see his face."



When making a speech Ben Butler was interrupted by some one who said: "Tell us about those silver spoons that you stole, General." Butler very calmly observed that he would gladly take up that subject a little later. Agreeable to his promise, Butler said: "Will my friend who asked about the spoons please stand up." Having done so, Butler said: "I suppose you are a Republican." "I am proud to say that I am." "Well, I was a Republican when I stole those spoons," Butler added.

*Why Is Heckling Not Popular in America?*

Undoubtedly the greatest and fairest of our American politicians have always welcomed questions on the part of their hearers. Tom Johnson probably owed a large part of his popularity to the fact that he encouraged questions at all times. It would seem that in the sphere of honest politics the candidate who would encourage all honest questions would have an advantage over his competitors. The type of politician who "has said too many things that need explaining and done too many things that can't be explained" will undoubtedly oppose heckling and submit to it only under compulsion.

Why has that old British institution, the heckling of candidates and political speakers, not taken root on our American soil? In the opinion of the writer, the answer is to be found in the fact that the politician is not taken as seriously in the United States as in England. Sent once to Milwaukee on a political crusade, a political orator ventured to ask a stranger, seated at his table in a restaurant, if he had been out to hear the imported speakers. Not aware that he was addressing one of the orators he replied: "Why should I waste any time on that hogwash?" When a speaker complained to a factory manager that his men when let out at dinner time would not stay to hear his speech, he got the reply: "Well, why should they?" It is too true that the average American Citizen treats the average politician as a necessary evil. If the American voter took his politics more seriously he would insist on the right of heckling candidates.

# Chats with Office Callers

***The Man from Bristol, England,*** dropped in long enough to tell us some very interesting facts about his ancient city on the Avon. Bristol, he said, is remarkable for its specimens of medieval architecture, chiefly ecclesiastical. The most beautiful church in all England is the 14th Century church of St. Mary Redcliffe. A small house near this church was the school where the poet Chatterton received his education. A house in Wine street was the birthplace of the poet-laureate, Robert Southey. A bank close by St. Stephen's church claims to have originated in the first savings bank established in England (1812). Similarly, the city free library (1613) is considered to be the original of its kind. Bristol was the western limit of the Saxon invasion of Britain, and about the year 1000 a Saxon settlement began to grow up at the junction of the rivers Frome and Avon. He says that in the 16th Century Bristol traded with the Spanish colonies in America, shared in the attempt to colonize Newfoundland, and began the American trade in African slaves which flourished during the 17th Century. The inhabitants of Bristol traded African slaves for sugar. The slaves were smuggled and hidden in secret passages in the cliffs about the town. He said that in his brother's house today there is a deep crypt, or well-like cavity, which was used to hide slaves for the market. Sea captains drifted into Bristol to procure their crews by means of the "shanghai" method and many a sailor boy awoke far down Bristol Channel with a sore head and a bruised body, ready for a hard voyage before the mast. Bristol, said he, existed before the Roman invasion. It is the port from which John Cabot sailed in 1497 upon the voyage which resulted in the rediscovery of the mainland of North America. The *Great Western*, the pioneer in steam communication across the Atlantic (1838), was built at Bristol. The city is today noted for its diverse manufactories chief of which are chocolate confections and paper bags. I asked him how he liked America and what impressed him most. He said he was astounded at the rapidity and accuracy of our machines used in manufacturing. All else paled into insignificance when compared to this.

ɤ ɤ ɤ

"I seldom quote great names in support of my ideas," said ***The Lecturer,*** as he discussed the address he had just delivered, "for the reason that they are too easy to get. You can secure a presidential letter approving almost anything, provided it is safe and innocuous enough. In fact there never were so many such letters afloat as there are today. When a man pulls out a bit of White House stationery to read as bolstering up his plea, anyone who knows the ropes knows just how much importance to attach to it. As a citizen, I don't like this cheapening of the official prestige, but as a public speaker I find its use to be a distinct detriment. The moment you quote a name—say that of Calvin Coolidge, or former Secretary of War Weeks—to recommend an idea which you believe with all your soul, you lose force. You drop from the plane of personal conviction to that of official approval. Your audience subconsciously gets it, and the speech skids a little. I used to do it. I used to gather an avalanche of important names and hurl them at an audience. Not any more. The idea, truly based, sincerely believed, clearly set forth, makes its way far more powerfully without the specious aid of great official names."

ɤ ɤ ɤ

***The Fur Man from the North*** dropped into The Office and remarked that if the fur business were placed on a business basis there would be no more fur business. "I catch and prepare my fur and sell it direct," said he, "but if everyone else did it, the business would die. Here is a fur that retails for $750. The trapper or fur-raiser is lucky if he gets $200 for it. I raise the fur, prepare it, and get $450 or $500—that is, I split the profit that is taken between myself and the public. But in so doing I take it away from the kings of fashion in the fur business. And it is they who make the business. People don't wear furs because they have to. Nor even because they are superior to other forms of clothing or ornament, but simply because the appeal of fashion, luxury and exclusiveness is still maintained in connection with furs, and it is maintained through the really strenuous campaigns of those who make the largest profits. Put the fur business on a business basis and these profits would disappear, the fashion-makers would no longer be interested, wearing a fur would no longer be a dollar sign, its use would fall off, the tribes of fur-bearing animals would have a long time to increase."

ɤ ɤ ɤ

***The Man from Washington*** says: "I note from the newspapers that in answer to Senator Reed and other opponents of the Italian debt settlement, Secretary Hoover is supposed to have said: 'The Italians will be glad if we don't pass it. They would be relieved of all moral obligations.' It seems to me that this is one of the most contemptible statements I ever heard any Cabinet officer making. If it is not grounds for impeachment, it certainly ought to be, for any Cabinet officer to make such a statement when his Administration is endeavoring to effect a settlement of these debts.

Of course it rings true to the theory that the Administration is doing all it can to cancel these debts and Hoover seems to be one of the leaders in that idea. He certainly has served notice on the Italian Government as to what the position of at least one of the members of the Cabinet is, and his influence in the Cabinet is well known in all diplomatic circles."

ɤ ɤ ɤ

The ***Printer from Berlin*** stopped in on his way to Chicago. This was his first visit to the United States and he spoke of the youthfulness of the people here. Even the older generation played like children. He had been told of the deplorable lack of culture among Americans. He was agreeably surprised to find it quite untrue. Nowhere in Europe, he said, will you find the museums and libraries patronized by the people as they are in America. At lunch time the New York library—to which he referred—was thronged with busy persons seeking knowledge. That is not true in Europe. "You people have no brakes on your brain. You let yourselves go. I have noticed your constant building up and tearing down of buildings. You are not afraid to destroy the old to build the new, as they are in Europe. I noticed your dock laborers in New York wear a good grade of heavy glove in their work. That is something the European workman would not think of doing. He wears a dress glove on Sunday but during the week his hands have no protection. Your people are hospitable. I come here a total foreigner but I am not a foreigner. I am entertained and I feel a spirit of friendliness so different from that extended to the traveler in Europe. I have been to South America. There the people are more Spanish than the Spanish of Spain. They have untold millions in natural resources, in water power in the Andes and in copper deposits. Development will come there but it will be slower than it has been in the United States of America. Conditions in Germany are deplorable today. There are 150,000 families who have no apartments of their own and are living grouped together to save expense. There is little or no chance for advancement in Germany due to the intense competition."

ɤ ɤ ɤ

"I have heard President Coolidge make two addresses on George Washington," said ***The Man from the East.*** "The first time, I marveled at the man's insight into Washington. I am something of a student myself and realize how little our people know their first President. But Mr. Coolidge in that first speech which I heard gave evidence of deep penetration into matters little heeded by the public, but which reveal the secret of Washington. I must say that Mr. Coolidge went up in my esteem.

"I heard his Washington anniversary speech this year, also. And I could not believe it was the same man. No man who knew as much about Washington as the President seemed to know in that previous speech could possibly have known so little about him as the President seemed to know in this 1926 speech.

"The only conclusion I can reach is that the assistant who helped Mr. Coolidge with his previous address was not the same person who assisted him this year. I consider this year's address—well, why say it? I trust, however, that the President will take a line of policy which will not render it necessary for him to wrest George Washington's words to support the errors of this Administration. Washington may have been wrong; he may have been right; but certainly he is not obscure. His words cannot be twisted."

# With Stefansson in the Arctic

## Hunting and Being Hunted by Polar Bears in the Regions of Ice and Snow; "King of the Arctic" Mistakes Men and Dogs for Seals

By BURT M. McCONNELL

Meteorologist, Canadian Arctic, 1913-1914

IF POLAR BEARS—the most dangerous beasts of prey among the land animals of North America—knew the difference between a man and a seal, they wouldn't be half so dangerous. But since they live exclusively by hunting seals, they are likely to mistake people for seals, and attack them on that basis. This, in the opinion of Stefansson, the explorer, makes them far more dangerous than the famed Kodiak bear of Southwestern Alaska. And he ought to know, for he has killed dozens of polar bears. Not only has he hunted them; he has been hunted by the clumsy, yet soft-footed King of the Arctic, who can indulge in his sneaking, skulking proclivities because Nature has given him a coat which renders him difficult to see against a background of ice or snow.

In the year spent with Stefansson in the Arctic, the writer came face to face with three different polar bears at less than thirty feet, and he wishes to testify right here that a polar bear at that distance looms up like a lighthouse in a fog. On one of these occasions, the writer killed the bear—his first—with a bullet through the head; on the other occasions he was armed with nothing more formidable than a camera, but was protected by the rifles of others. He never saw more than three bears traveling together, but a fur trader on the north coast of Alaska, whose integrity has never been questioned, declared that he once saw sixty-eight polar bears at a time, burrowing into a whale carcass, and that he and one Eskimo companion killed twenty-two of them.

Perhaps they did; the animals had gorged themselves, and were too full of whale blubber to fight. Besides, the hunters were safely hidden behind ice cakes. It is the polar bear that sneaks up to a camp on the ice, in the belief that the sleeping dogs are so many seals basking in the sun, that is to be feared. This is what happened to us at a point on the sea ice some sixty miles off the north coast of Alaska.

We had been traveling by dog team over the moving ice, in search of land, when, one bright spring day, a polar bear boldly walked into our camp on the ice and was within twenty-five feet of our two dog teams before he was discovered.

We had been halted that day by a narrow lead of open water, and had killed several seals—for the dogs and ourselves. Storkerson thereupon set to work to make a stove that would cook the seal meat with its own blubber.

In less than an hour the odor of the burning blubber and cooking seal meat brought a polar bear into camp. We had placed the dogs and sleds upon a floating cake of ice in the lead, ready to be "ferried" across, and were cooking seal meat with the blubber from the same carcass, when we were brought to our feet by a great commotion on the "ferry."

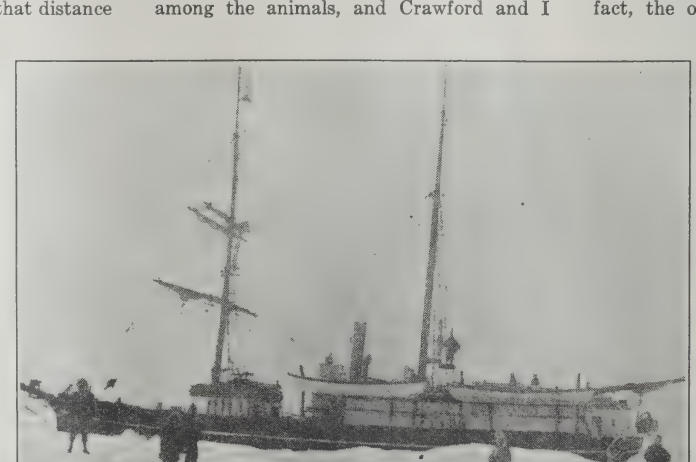
Stefansson and Storkerson, who were nearest the dogs, ran toward them to stop what they thought was a fight among the animals, and Crawford and I followed, as we knew where the whips were. However, we turned back when it seemed that Stefansson and Storkerson could quiet the dogs. But before we reached our seats, Storkerson yelled "Polar bear!"

That was enough.

Knowing that our very lives depended upon our dogs, and that a polar bear could kill all of them with a few blows of his powerful paws, we ran to the assistance of Stefansson and Storkerson.

We saw that there were only two rifles on the sledges, unfortunately, and realized instantly that the best thing left for us to do was to restrain the dogs from dragging the sledges and their precious loads into the water, in their eagerness to attack the bear.

The white, shaggy monster was only twenty-five feet from the dogs. Fortunately, he was on the opposite side of the open water. He did not appear to be in the least afraid of the barking dogs, but completely ignored them as he stood facing us, with his head hanging downward and swinging slowly from side to side.



From time to time he peered into the water, as if trying to make up his mind to plunge in and swim across. Never in his life, it may safely be said, had this creature seen either a man or a dog. In fact, the only animals he had seen were foxes and seals, and he knew himself to be the master of these.

By this time, Storkerson and Stefansson had arrived at the sledges, and were almost ready to fire, but the bear gave no heed to them or to the dogs, which by this time were in a perfect frenzy.

Storkerson was the first to reach his rifle, and just as it appeared that the bear was about to swim over and kill our dogs, he took aim quickly and fired. The bullet, a .30-.30, hit the bear in the right foreleg, and swept that member from under him, so that he turned a complete somersault. It was at this juncture that I snapped a picture of the bear, but it was not a success.

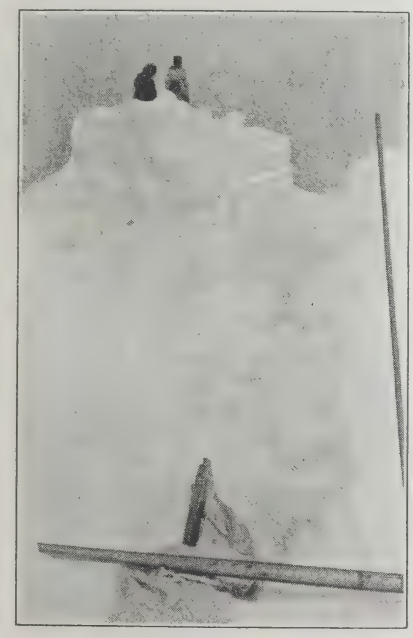
When the bear came to the surface, all thought of visiting our camp had vanished; his only thought was to escape from this instrument which spat fire.

By this time, however, Stefansson had reached his rifle, which he had placed in its case that afternoon. The bear was wounded, and it would be better to end its misery. So Stefansson fired

The *Karluk*. While Stefansson was ashore hunting caribou in Alaska, the *Karluk* drifted away and was sunk 180 miles off the coast of Siberia.

with his hard-shooting Mannlicher as the now thoroughly frightened King of the Arctic clambered out upon the ice and started to limp away. This bullet took effect, as did another which Storkerson sent after the fleeing animal, but the bear, dragging its right foreleg, disappeared behind a pressure ridge.

During the excitement, as we now noticed, the lead had narrowed so much that Crawford, with the .30-.30 rifle, and I with the camera, were able to cross with the aid of a pair of skis and a long pole. We followed the trail of blood at a run, expecting at every turn in the trail to come upon the wounded animal, but we had proceeded almost half a mile before we saw him staggering along, holding his right foot clear of the ice. When the bear realized that he was being followed, he instinctively dived in the first water he came to, and it should have been a simple matter for Crawford to place a bullet in a vital place when the bear came to the surface. After three attempts had failed, however, Crawford found that he had no more cartridges, and I was about to run back to camp for more when Stefansson appeared, bringing his Mannlicher. Although this rifle is of smaller caliber—.256—one bullet in the bear's heart killed him instantly as he clambered out upon the ice.



On shore polar bears are ordinarily timid animals, afraid of men, dogs, and wolves. On the sea ice, however, they have no enemy to fear. In fact, they are familiar with only three living things—seals, on which they live; white foxes, those scavengers of the North; and sea gulls, which flutter about them after they have killed a seal. The Arctic fox, which is almost as much of a sea animal as the polar bear, is unable to provide his own living while on the sea ice. Several, therefore, will always be found following a polar bear wherever he goes. When the bear kills a seal, he eats all he wants, usually from a quarter to a half of the carcass. Sometimes he does not touch the meat at all, but eats merely a portion of the blubber and the skin that goes with it. After this meal of fifty or seventy-five pounds of blubber, it is quite natural that he should feel like sleeping for several hours. This he usually does, while the foxes finish the carcass. If, however, the bear returns for a second portion, the foxes and gulls scatter to the four winds, giving the bear the impression that these creatures are not the least bit dangerous, but too crafty to be caught.

Now, a polar bear is able to tell the difference between a living seal and the meat of a dead one, when he sniffs them in the air. A bear traveling to leeward of a camp on the ice perceives many camp odors, all of them strange except that of seal meat. Knowing no fear, he comes straight into the camp, walking leisurely, for he expects every living thing he meets to make way for him. But if, when he is within a hundred yards of camp, one of the sleeping dogs happens to move, the bear immediately concludes that there are some live seals, after all. He instantly flattens out upon the ice, like a cat stealing upon a bird, and, with under jaw sliding over the snow, advances, almost toboggan fashion, toward the dogs, stopping abruptly if one of them moves, and advancing again when they become quiet.

Eventually one of the dogs is sure to see or smell the bear, and he commences barking. Within a couple of seconds every other dog is barking. The bear is keenly disappointed. Judging from his actions on such an occasion, he apparently concludes that these are not seals, after all, but foxes, which are beneath his contempt. Remembering that he is here for seal meat, and not foxes, he rises to his feet and fearlessly approaches the camp. A properly placed bullet ends the story.

Dogs curled up in the snow of the Arctic.

Two of the party taking a "sight" from a pressure ridge.

Stefansson bringing a seal into camp.

In order to understand how the polar bear lives by killing seals, we must take into consideration the action of the elements upon the drifting ice fields. There are many gales in the Arctic during the summer, and each gale breaks up the ice. As there are no frosts to cement the fragments together, the seals can travel freely in all directions. Then comes the autumn, with its light frosts and young ice forming everywhere. But the seals are not ready to hibernate for the winter, and for a time continue to break the ice with a sharp upward bunt of their head, in order to breathe. Until the ice reaches a thickness of four inches, a seal traveling along a lead covered with young ice will leave behind him a trail of circular holes in the ice where he has thrust his head upward. These may be fifty or a hundred feet apart.

When the ice thickens and becomes harder, the seal must stop traveling. But by gnawing from beneath like a beaver, he keeps his breathing holes open all winter. At the surface the openings are only an inch or two in diameter, but underneath they are enlarged continually until they become large enough for the seal's body. Each seal has a half-dozen breathing holes that are covered with a few inches or a few feet of snow, and thus are hidden from the observation of most men and the seal's deadlier enemy, the polar bear. But the bear can discover these breathing holes by the sense of smell, and if the ice surrounding it is only a few inches thick, he will, with his mighty forelegs, break it up for a distance of several yards around the breathing hole. The seal, when next he rises to breathe, becomes a meal for the waiting bear.

When Stefansson first went into the Arctic he was solemnly assured by the Eskimos that polar bears and other animals are much wiser than men. When asked by Stefansson why these animals permit themselves to be killed by men, the Eskimos assured him it was because there are certain things which animals need, and which they can get only from men. The seals and whales live in the salt water, and are therefore continually thirsty. They have no means of getting fresh water, except to come to men for it. The Eskimos believe, therefore, that a seal will allow himself to

be killed by the hunter who will give him a drink of water in return; that is why the Eskimo pours a dipper full of water into the mouth of a seal when he brings it ashore. If a hunter neglects to do this, all the other seals will learn about it, they believe, and no other seal will ever allow himself to be killed by that particular hunter, because he knows he is not going to get a drink.

The polar bear, Stefansson was solemnly informed, does not suffer from thirst as much as seals, for he can easily get snow on top of the ice. But polar bears are unable to make for themselves certain tools which they need. Now, the Eskimo hunter believes that when a polar bear has been killed, its soul accompanies the skin into the hunter's house and stays with the skin for several days. During this time the skin is hung up at the rear end of the house, together with the tools which the bear desires.

At the end of the fourth day, the soul of the bear, according to the Eskimo, is driven out of the house, and when it goes away it takes with it the soul of the tools which have been suspended with it and uses them thereafter. If the bear's soul has been properly treated during his stay, and if he has received the soul of implements of good quality, then he will report these things in the land of the polar bears to which he returns, and other bears will be willing, and even anxious, to be killed by an Eskimo hunter of such integrity.

On one occasion, after Stefansson had discovered new land in Latitude 80° N., Longitude 100° W., he and two companions were returning over the ice to the base camp, some 450 miles to the southward. Just after they had pitched their tents, about fifteen yards from the open water, one of them noticed something white moving in the open lead about two hundred yards from the tent. He thought at first that it was a piece of drifting ice, but when it began to move too rapidly for that he picked up his field glasses to see what it really was. As he was focusing them upon the object, it disappeared beneath the surface of the water, reappearing a little nearer to the camp. The white object was not a chunk of ice, but the head of a swimming polar bear.

Stefansson and the other members of the party quickly emerged from the tent, grabbed their rifles, took up positions behind the sledge, and waited patiently for the bear to clamber out of the open lead; for it is difficult to drag the carcass of a polar bear out of the water. The one who had sighted the bear stayed with the dogs to quell any disturbance they might make when they caught sight of the shaggy monster.

Evidently the bear had seen the dogs sleeping in a row on the ice and had thought they were seals. For at that time of the year seals like to lie on top of the ice beside their holes, or along open leads, basking in the warm sunshine. The bear took great pains in stalking the dogs. He would swim slowly back and forth across the lead, occasionally lifting his head a little above the level of the ice to see if the "seals" had noticed him. But the dogs, tired from their day's work, were lying stretched out comfortably on the ice.

Finally the bear reached a spot nearly opposite the camp. Carefully he placed his powerful forepaws upon the ice. Then quickly, but without a sound, he lifted himself out of the water and in an instant was nearly on top of Stefansson's companion, Noice. He was within perhaps ten feet of them before Noice had time to fire. At the report the bear turned a complete somersault in their direction. Noice again pulled the trigger of his rifle, but it would not budge—his rifle was jammed! At this critical instant Stefansson fired with his Mannlicher and the bear rolled over, dead, so close that they could almost touch him.

The author and Storkerson lashing canvas tarpaulin over sled to cross open lead.

While traveling along the Arctic coast of Canada one winter day, Stefansson saw through his field glasses, perhaps a mile out at sea, in the rough ice, a spot which seemed to him more yellow than ice ought to be. He watched this spot for a long time, but saw no motion.

Stefansson continued to sweep the horizon with his glasses for several minutes, and his mind was just about made up to proceed along the coast, when on looking back he saw that the yellow spot had disappeared. Concluding that it was a polar bear, Stefansson, after carefully taking his bearings by keeping certain mountain peaks in mind, hastened out over the chaotic ridges until he reached the spot where, in his estimation, he had seen the bear. The explorer climbed upon a pressure ridge about forty feet high, and spent some time looking around, with and without his field glasses, but saw nothing. He then decided that he would move from summit to summit for perhaps a quarter of a mile until he felt sure that he had passed beyond the bear, then begin to circle until he came upon the animal or its tracks.

Stefansson had concluded that the bear was ahead of him, and was clambering down from a high ridge in order to start his campaign, when he heard behind him a noise something like the hiss of an angry goose. He looked back and saw, about twenty feet away and almost above him, a polar bear. Had the animal come the remaining twenty feet as quietly and as rapidly as a polar bear can, Stefansson probably would not have lived to tell the story, for his rifle was buckled in its case and flung across his back.

From the polar bear's glittering eyes and menacing attitude, as well as the story his trail told afterward, there was every indication that he had meant to spring upon Stefansson. But he had made the fatal mistake of giving warning to a man with a rifle. The hissing noise Stefansson has always interpreted as "Watch me!"

After he had dispatched the bear, the explorer found written in the snow the following story: He had overestimated the distance of the polar bear from shore, and had passed the spot where he lay, going a hundred yards or so to windward. On getting Stefansson's scent, the bear had come up the wind to his trail and had then followed it. Stefansson had not seen his approach, for it had not occurred to him to look back over his own trail; he was so used to hunting polar bears that the possibility of one of them hunting him was left out of consideration.

While Stefansson was crossing the sea ice from Alaska to Banks Land, a journey on which the author accompanied him for the first seventy-five miles, a polar bear made a rather dramatic entry into the camp. Stefansson and his two companions, Storkerson and Andreason, were about a quarter of a mile distant at the time. As usual, their six dogs were tied near the tent, strung out at intervals of about six feet (to keep them from fighting) along the tie-line, which was fastened at both ends to chunks of ice.

Stefansson's two companions were in the sledboat, paddling around about fifty yards from the solid ice, and Stefansson with his glasses was standing on a hummock. Suddenly he noticed a bear about a hundred yards to the north, advancing toward them at a steady walk. Stefansson started for camp on a run, just as the bear caught sight of the dogs, and began to stalk them. Stefansson shouted, but this had the effect of drawing the dogs' attention to himself, and away from the bear, which continued to advance. Finally the animal reached a large hummock about twenty yards from the dogs, and still they had no warning of his presence.

Stefansson knew, from his long experience with polar bears, that when the bear got that close he would make a dash from cover, as he would upon a seal basking in the sunlight, without realizing that he was attacking a dog. When, therefore, the bear half stood up, preparatory to making his dash, Stefansson, then about a hundred and twenty-five yards away, fired. The bullet, he afterward ascertained, entered two inches back of the heart. In some way, it seemed to paralyze the bear's spine, for his forelegs doubled underneath him, so that his chest and under jaw rested on the ice. As Stefansson approached, keeping his rifle at his shoulder, he could see that, though badly wounded, the animal was still alive.

Suddenly, without the slightest warning, the bear launched himself directly at Stefansson. But the explorer, whom experience had taught to be wary in such instances, had his rifle ready and automatically pulled the trigger. Fortunately, the bullet pierced the brain. It was a narrow escape, for by the time the bear collapsed he had covered about three and a half of the five yards between himself and the hunter, and collapsed so near that blood spattered upon Stefansson's boots. This incident, and the others which I have recounted, have increased by a considerable degree Stefansson's respect—and mine—for the intelligence and craftiness of the polar bear.

## What Our Dreams Mean

(*Concluded from page 4*)

this he had talked so often that it had become boresome. So the dreamer gave vent to his feelings by having the book titled with the word *brag* in a prominent position.

This is known as condensation. About its existence there is agreement.

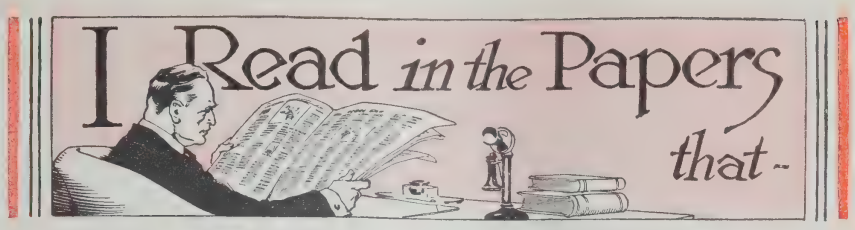
These April Fool candies with a hot pepper center inclosed in a tempting chocolate shell are like dreams. The chocolate covering is all that can be sensed, until the pepper strikes the tongue. So with dreams; the part first recalled usually conceals a decidedly different core. It is the pepper-filled center, and not the coating one so easily recalls on awakening, which is significant. Most of the dreams we remember have a concealed part which must be discovered if we are to understand the meaning of the dream. In this there is agreement.

Discovering this concealed part is the interesting, though difficult, task for psychoanalysis. This *latent content* of the dream may cause an irritable day, may cause fears in children, may cause an inconveniencing headache, or may give the psychoanalyst the clue to the removal of mental peculiarities or apparent bodily ailments for which physicians can find no cause or remedy.

The latent content may be discovered in two ways. Just as one may suddenly recall the dream of several nights past so the psychoanalyst sees that his patient is in a similar daydreaming state and gets him to disclose all that comes into his mind about the dream. Bit by bit it will appear until the whole dream can be pieced together.

But even when the whole dream is recalled, only half of the latent content is known. The Englishman cannot understand American slang, and during dreams our mental life has a slang of its own. To add to the difficulty, each dreamer has his own slang. This is known as *dream symbolism*.

The detailed sexual symbolism Freudians have elaborated to interpret dreams are entirely rejected by some, accepted in part by some, and worshipfully followed by others.



So there you are! We know there is symbolism, but by force of circumstances and experience are inclined to think that it is not common to every human being; that each may have his own symbolism, just as a western porch becomes a stoop in the South, or a veranda in other parts of the country.

Why do we dream, anyway? If one's feet are comfortable, if there is no disturbing alarm clock, might we not cease dreaming?

Never, says Freud, so long as there are wishes and desires burning in the breasts of human beings. His followers can conceive of the absence of dreaming only in a desireless race. And where is that race?

The function of the dream, they say, is to satisfy these unfulfilled desires mentally. The boy who has visited the circus dreams he is eating candies denied him that afternoon. His desires are being rather simply and frankly fulfilled in the dream. In adults these desires are concealed in the latent content and symbolism of the dream.

"They're there!" shout the Freudians. And to further impose upon credulity they claim in tones as strident that they are sexual desires. And at this point you will find most psychologists clamoring for the Freudians to get off the band wagon.

Sir W. Arbuthnot Lane, famous British medical authority, has this to say of his visit to America, in the *English Review*:

> "Having recently spent a month in the United States and Canada, where I have had every opportunity of studying the progress which surgery and medicine have made there, I am glad to be able to state the results of some of my experiences and the conclusions at which I have arrived.
>
> "I was greatly impressed by the very intimate association which has sprung up between the medical profession and the 'lay public' in the last few years, to the very great advantage of the latter. The barriers which exist here between our profession and the public, because of the autocratic attitude taken up by sections of the medical community, have fortunately disappeared in those countries."

one man in every twenty-eight in France was killed during the World War, one in thirty-five in Germany, and one in sixty-six in England. France's war dead totaled 1,363,000; of whom 669,000 were farmers and land workers; 235,000 were in industry; 159,000 in commerce; 40,000 in professions; 21,000 in civil service; and the remainder in miscellaneous occupations. The terrible effect of the conflict on France is more readily understood when it is realized that one-seventh of her agricultural population was killed.

* * *

the lives of 500 Chicago babies will be saved within the next year by the new "human dairies" established by the city. The first group of mothers to volunteer the sale of their excess milk have been examined. Milk taken from these mothers will go to babies whose mothers are unable to breast-feed them.

"We will pay 10 cents an ounce for the milk," the Health Commissioner said, "and sell it at from 3 to 30 cents. To babies in poor families, however, it will be furnished free of charge. Our purpose is not to make money but to save lives."

He estimated that the daily supply of milk from one healthy mother will be between 25 and 30 ounces in addition to the 30 ounces needed for her own baby. Thirty mothers, therefore, he said, could supply more than 45 pounds of milk a day, or enough to feed 25 to 30 babies. The mothers should receive from $2.50 to $3 a day in addition to the best fresh food, to be furnished them free.

Price: 25 cents each; set, $1. The Dearborn Publishing Company, Dearborn, Michigan.

A. N. Jacobs has finally entered the Minneapolis workhouse to serve a 60-day sentence for libel of the one-time famous Senator Magnus Johnson, of Minnesota. It seems that Jacobs who was a sort of political "fixer" had published a scurrilous article: "Magnus Johnson Steps Out" during that notable's campaign for reëlection to the United States Senate. The article was a racy account of the arrest for drunkenness of a Magnus Johnson. It seems that another person bearing the Senator's name was the one really named by the article, but its intent was to besmirch the candidate. The public should rejoice that one of these panderers to a certain taste for vile personal scandal during political contests should be put to work at the public business of making little ones out of big ones. It is such persons as Jacobs who make so many men decline to run for public office and abandon it to those thick-skinned individuals who ignore what is said about them as long as they win.

* * *

"Why," exclaimed Professor Einstein in Paris, "do some people speak of great men in terms of nationality? They like to call them 'great Germans' or 'great Englishmen'! Goethe always protested most vigorously against being called a German. Great men are simply 'men'; they are not to be considered from the point of view of nationality. Neither should the environment in which they have been brought up be taken into account. Great men are simply born." Thus, it would seem, Einstein modestly enrolls himself among the great men.

* * *

Anastasious Bazagis applied for citizenship in San Francisco and was told what he had to do. He was found dead in his lodgings with a pistol gripped in one hand and a naturalization blank, a copy of the United States Constitution, and essays on George Washington in Greek script in the other. The struggle to qualify himself for citizenship had been too great, the police said.

It has been sensibly remarked that mental training is only one of the seven moralities and perhaps of all of them the one most overemphasized at the present time. It should be easily possible to devise effective methods to enable such men as Anastasious Bazagis to qualify for citizenship without befuddling them until they become filled with despair. No business concern would tolerate an employment department whose methods caused honest men, qualified to perform their work satisfactorily, to become so fearful lest they be unable to answer academic questions that they occasionally jumped in the river.

# When Wilson "Walked With Kings"

(Continued from page 2)

"I think that now," added Mr. Wilson, with a twinkle in his eye (speaking the day after election, 1914), "I'll telephone Senator Newlands and ask him to hold a caucus of the seven Senators in my office, that I may remind them of the ghosts they were seeing a year ago."

About this time the bill creating the Federal Trade Commission was before Congress. A strong group of Democratic members opposed the kind of commission Mr. Wilson wanted. They advocated giving the commission powers which Mr. Wilson believed would make it subservient to business rather than an agency that would free the market place of dishonest business.

After considerable cloakroom discussion, these Representatives (numbering some of the strongest leaders in Congress) selected one of their number to call on the President, to try to bring him to their view. The man chosen for the job was not only a warm friend of Mr. Wilson and an able, experienced legislator, but he was also an important member of the House Judiciary Committee, which had the bill in charge.

The opposition group waited anxiously for his return, after he had gone to spend twenty minutes with Mr. Wilson at the White House offices by appointment. They hitched their chairs forward to listen to his report when he rejoined them, hopeful that he had perhaps succeeded in changing the President's mind. He faced them and reported:

"Well, I've agreed that we'll support the President's bill and pass it without delay."

Pressed for an explanation of this startling statement by the surprised members, he explained:

"You know, it's impossible to do anything with that man. I never saw anybody like him. It wasn't even an argument. He attributed to me, right at the beginning, the same unselfish desire for the common good that actuates him, and he pitched the talk on that plane. The only way I could have got away from it would have been to admit that I wanted to benefit special business interests, and I'll be damned if I could do it, so I wound up by pledging him our support."

In that case Mr. Wilson not only "kept his virtue," but instilled some of it into the talking "crowd," with the result that the administration bill was speedily passed.

Two dramatic incidents (small in themselves but large in significance) illustrate Mr. Wilson's ability to "talk with crowds and keep his virtue" and "walk with kings—nor lose the common touch." The first occurred in the 1912 campaign when Governor Wilson was chatting with friends on his train after a huge political meeting in Philadelphia. Mr. Wilson seemed serious almost to the point of depression, despite the fact that the Philadelphia meeting had been a tremendous success. The crowd had not only been enormous, but the enthusiasm for the candidate had been an actual ovation. Dense throngs had filled the Academy of Music, where the speech had been delivered. Local leaders had said no such demonstration had ever been made for a presidential candidate in the Quaker City. Those present, therefore, were surprised that the Governor was not in high spirits, and commented on the fact.

"Well, I do not feel at all hilarious," replied Mr. Wilson seriously. "A little incident occurred as we were struggling through the crowd to get out of the hall, and it has depressed me, because it has made me feel with particular keenness the almost overwhelming weight of responsibility that will be mine if I am elected. A poor woman, poorly dressed, but with shining, hopeful eyes, fought her way through the swarm of cheering, surging humanity until she got to me. Then she seized my hand and clung to it desperately.

" 'Oh, Governor,' she said, as tears ran down her cheeks, 'I'm so glad you are going to be President. You are such a good man and you want to help the plain people, and I know if you are President food will be cheaper.'

"Now, of course, food will *not* be cheaper merely because I am elected President. The high cost of living is due to far-reaching, economic causes, some of them world-wide in character. If the economic policies of the Democratic party can be established in this country there is hope that the high cost of living may be reduced. At least there will be opportunity for all to share in any prosperity that may eventually come. But when I realize that there are thousands and hundreds of thousands of persons like that poor woman pinning their hope for immediate relief on me, I am frightened. Such thoughts drive completely from my mind any inclination to feel proud or jubilant over such colorful demonstrations as we had tonight."

The other incident occurred in Italy. No man ever more truly "walked with kings" than did Mr. Wilson on the occasion of his visit to the Italians in January, 1919. No emperor, king, or conqueror since Nero or Caesar had ever been so universally proclaimed. The people literally bowed down and worshiped him. They put pictures of him in their homes beside that of the Saviour, burned candles before them, and knelt and expressed their thankfulness and hope in prayer. To them he was another savior, come to lead them out of the blind horrors of war to universal brotherhood and peace. With King Victor Emanuel at his side, Mr. Wilson passed through the worshiping throngs.

And in the evening of his first day in Italy, with solemnity even graver than on the night after his Philadelphia meeting, he revealed by his comment to a member of his party that he was far from "losing the common touch."

"It has been the most distressing, most painful day I ever experienced," he said, without a trace of jubilation or triumph. "I had no idea the people of Italy felt so deeply. I realize, of course, that it is not *I* they worship but an *idea* which I have expressed and which has been exalted by them. It is not only embarrassing, however, to have them show such deep feeling for me, but it makes me tremble when I realize what a frail, weak instrument I am to carry through their hopes and longings. I also am troubled over their depth of feeling for another reason, and that is that it may at any moment be swept away by something I might do or say. This shows me that today's ovation was not really for *me*, but for an ideal which the Italian people themselves have in their hearts, and which they believe I, at the moment, represent."

That Mr. Wilson had the ability to see ahead along the paths of those who "walk with kings" was demonstrated only a few weeks later, when the whole Italian people turned against him because he favored making Fiume an independent city and free port.

Another occasion in Mr. Wilson's life when most men would have thought they were "walking with kings" was the night of his first election as President of the United States in 1912. Friends, members of his family and political associates with whom he had been through the campaign, nearly lifted the roof off the quiet Wilson cottage at Princeton with joy and hilarity as the returns rolled in, with state after state for Wilson and with his majority in the electoral college mounting higher and higher. Outside, fifteen hundred Princeton students held a typical collegiate demonstration, with college yells, red fire, and furious cheering.

Early in the evening Mr. Wilson sat in his library, reading a book on American history. Later, when the first significant returns began to come in, he joined the

(C) Harris & Ewing.

Crowd gathered at birthplace of President Wilson, Staunton, Virginia.

crowd in the small living room. As the night wore on and his election seemed more and more certain, all present except Wilson became more and more joyful. His attitude, on the other hand, became increasingly serious. By the time everybody else was bubbling over with joy his face was drawn into serious lines. Upbraided by a friend for being so serious on such an occasion, he exclaimed:

"I have no inclination to throw up my hat, jump up and crack my heels together. I do not feel the least bit gay. On the contrary, I feel solemn with the serious responsibility which it seems the American people have placed upon me. I hope I may prove worthy."

Four years later, at Shadow Lawn, New Jersey, as the news of Mr. Hughes' apparent election came in over the wire, Mr. Wilson laughed and joked with members of his family and friends who were present. They, on this occasion, became more and more solemn as the evening wore on. Mr. Wilson was almost hilarious. He told funny stories, recited his favorite limericks, and twitted the others on their funereal countenances. At ten-thirty he arose, yawned, and announced that he was going to bed, as his remaining up and losing sleep would not change the result. The others tried to give some expression of their disappointment and sympathy. Admiral Grayson, his physician, commented:

"Never you mind, Mr. President, four years from now the people will realize their mistake and demand your return to the White House."

Mr. Wilson held up his hand as if to say, "Never again," a delightful twinkle came into his eye and he replied to Grayson, in playful mood:

"No, Grayson, I'm like the Confederate soldier who returned to his home after Lee's surrender. He looked at his wrecked farm, where the buildings had been burned, the stock killed or run off and the fences torn down. Then he looked at his bare and bleeding feet and at his one arm in a sling and remarked:

" 'I'm glad I fought. I'm proud of the part I played. I have no regrets, but—I'll be damned if I ever love another country.' "

With a smile and a wave of the hand to the rest of the party, Mr. Wilson, accompanied by Mrs. Wilson, left the room. He was asleep by eleven o'clock and did not learn, until eight the next morning, that instead of being defeated he had been elected.

He thus demonstrated again by his attitude on the occasion of these two greatest crises of his career, his ability to live up to Mr. Kipling's ideal.

"If you can dream—and not make dreams your master;
If you can think—and not make thoughts your aim;
If you can meet with triumph and disaster
And treat those two imposters just the same."

Governmental figures and delegation from Alabama which called on President Wilson to present him with a prize rooster. The incident served to afford the President brief relief from his troubles with opponents of the League of Nations.

One of the charges repeatedly made against Woodrow Wilson was that he could not get along with any one who differed with him. Perhaps no President was more loyal during his official life to those whom he had appointed. It irritated him extremely for any friend to suggest that another appointee was not playing fair. He simply would not listen to any attack upon one in whom he had shown his confidence by appointing him to a public position, and no amount of attack would make him waver or shake his faith. On the other hand, he demanded the same kind of loyalty to himself from those to whom he intrusted national affairs.

It is of course well known that Mr. Wilson ceased to have intimacies with some splendid persons who were near to him. The world has yet to learn the exact reasons for Mr. Wilson's change, so wonderfully did he keep his own counsel and refuse to "give way to hate."

One of the conspicuous attacks made upon him to prove that he could not get along with other men, was the charge that he had broken faith with Grover Cleveland, and the latter had become his enemy. It is said that there is a letter in existence written by Mr. Cleveland in which he attacked Woodrow Wilson. I have never seen this letter, and I do not know whether they ever became estranged. I do know that Mr. Wilson cherished Mr. Cleveland's memory and was loyal to him, since I was a witness of an incident which impressed this indelibly upon my mind. It occurred in October, 1908.

Mr. Wilson had made a trip to Denver, Colorado, to address the American Bankers' Association at its annual convention. He delivered his address during the day session. On the same evening the visiting members were entertained at a dance given at the El Jebel Temple. Mr. Wilson, having paid his respects to those in charge of this affair and looked in upon the dance, emerged from the building with a whole evening ahead, all dressed up and no particular place to go.

"Well," I inquired, "what shall we do? There is a social affair on at the University Club and William Randolph Hearst is to hold forth at the Auditorium, where he promises to expose the inside workings of a certain great oil company, with documentary proof of the charges he is making."

The latter suggestion was immediately accepted and we made our way on foot to the hall. As we entered we were joined by Frank M. Vaughn, a resident of Denver.

The Auditorium is capable of holding many thousands. It can, however, be converted into a theater which holds about 3,500. On this occasion the theater had been set in place, and it was already so crowded that we could not find seats. Finally we met the mayor of the city, Robert Speer, who kindly ushered us into his box.

For some unknown reason Mr. Wilson peremptorily insisted that he be permitted to sit in the rear of the box and that I sit forward and in front of him. Mr. Vaughn sat on his left.

There had been a delay in the arrival of Mr. Hearst's party, so that, although we were late, we had the opportunity of seeing him come in. To make an impressive entrance, the back drop of the stage had been lifted, permitting the audience to see the space behind the stage to the street beyond; a distance of almost a hundred yards. This gave a splendid view of the band and the crowd that was with Mr. Hearst as they entered and marched through the back part of the building, up and across the stage. First came the band, then Mr. Hearst, his tall figure draped in gray. Behind him were perhaps 500 followers. The whole setting of his appearance was very spectacular.

To let the audience in front and on the stage get well settled before the speech of Mr. Hearst, one of his party, Joseph R. Buchanan, of New York City, was used as a buffer. He arose and had been speaking for about five minutes when suddenly he launched into an attack on the late Grover Cleveland, which became vitriolic in its fierceness. He had just exclaimed: "Grover Cleveland was the most implacable foe of organized labor that this country has ever known," when Mr. Vaughn and I were startled by an utterance of Woodrow Wilson, who exclaimed with suppressed but tremendous emotion: "Damn him!"

I was so surprised at my former teacher, whose control I had often envied and had never before seen upset, that I whirled around to see if my ears could have deceived me. But there was no mistaking the source of those words. Woodrow Wilson's eyes were flashing with intense indignation and an outraged feeling of unfairness on the part of Mr. Buchanan. In fact, he was leaning forward in such a way that I half expected he was about to rise and speak out.

It is hardly probable that the sound of his voice reached those in the audience, since the box was quite a distance from the parquet, but it was immediately evident that Mr. Wilson was in common touch with the audience, for, like the noise that follows a flash of lightning, hisses from all over the house almost immediately followed his exclamation, increasing to a thunderous roar of anger that drove Mr. Buchanan to his seat, unable to say another audible word.

As we strolled back to his hotel in the wonderful October evening, Woodrow Wilson dilated at length on what he charged was the untruthful statement of the unfortunate Mr. Buchanan.

# When You Buy Your Own Home Site

(*Concluded from page 7*)

5. Lots must have certain minimum widths for various streets. On A street no building shall be erected on a lot less than one hundred feet wide; on B street the minimum width must be seventy-five feet; on C street, fifty feet. The building lines on each street must be uniform, and the houses must face specified directions.

6. Within the subdivision, no nuisances, such as chicken coops, cesspools or the like, are allowed.

The ownership restrictions of many subdivisions state that property may be sold only to members of the Caucasian race.

Of course, the number of these restrictions varies with different subdivisions, ranging from half a dozen of the most important limitations, embodied in the warranty deed, to a large number, which may fill a small, compact book. The rule is: The finer the neighborhood, the greater the number of restrictions. A farseeing purchaser will make certain that the subdivision in which he buys is well restricted, for nothing is more necessary in protecting one's property from unforeseen troubles and nothing else does as much to insure the permanent distinction and charm of a residential section.

*Must Beware of Public Nuisances*

The lot buyer has to beware of public nuisances. Suppose you buy an attractive site in a subdivision near the city boundary line or just outside. After you have spent a small fortune in building your home, have moved in and have become settled, happy and satisfied, an oil refinery is constructed on some ground half a mile away. Its appearance disfigures a charming landscape. The breeze wafts you its obnoxious odors. The whole family is shocked and angry; your friends and neighbors complain and discuss the evil constantly; you worry about it a great deal, and you can do absolutely nothing to improve the situation.

The only way to safeguard yourself against this danger is to investigate closely before buying. Learn what the owners of surrounding property intend doing with their real estate. If the lot you are considering is near a railroad, be doubly cautious because factories, refineries, and warehouses usually require railroad trackage.

Property owners in the United States have lost great sums in real estate depreciation due to the invasion of high-class residential neighborhoods by factories and refineries. In a city of 175,000, a case of this kind took place several years ago. A real estate firm bought some expensive acreage just within the city's limits. Plans were designed for a distinctive, smart subdivision; streets were laid out and paved; all the many modern improvements and conveniences were installed. The real estate company launched an aggressive advertising campaign, and the selling of lots began. But the promoters had failed to consider one serious danger. The subdivision was bounded on the west by a railroad line. Half a mile to the north ran the city boundary line.

An oil concern purchased several acres adjoining the railroad tracks just north of the city line and erected its refinery there, consisting mainly of several huge, black steel tanks and a row of cheap three-room cottages. The beautiful view which the subdivision commanded was ruined. When the wind blew from the north, an offensive odor from the refinery came with it. The people who had built homes in the subdivision complained strenuously, fairly broadcasting their dissatisfaction. The selling of lots thenceforth became uphill toil.

We have now reached the problem of the lot itself. To be on the safe side, one must judge it from several angles. Otherwise it is possible to become so attracted by one or more features that certain important disadvantages are overlooked.

Generally speaking, the site should be situated higher than the surrounding ground, if possible. This position promises a greater outlook and better drainage. Another advantage is coolness during the hot months. The heat is intense in many American cities during summer, and a home that is swept by refreshing breezes, while most of the town swelters, certainly endears itself to its owner. The sleeping porch is built so as to face the direction from which the breezes come, and because of its perspiration-proof qualities, it becomes the favorite spot of the whole family in the hot season.

Everybody who has studied residential property development in various cities has observed that it is an almost invariable rule that the highest points in the residential sections command the highest prices.

Whatever you do in buying your lot, be sure to look thoroughly into the foundation. There lies real trouble. A salesman's enthusiastic assurance that the lot will provide a strong foundation at small cost is not enough. He may be quite sincere and yet mistaken. In this respect especially, lots have a way of proving treacherous.

A well-to-do oil man several years ago bought some expensive land in a western city and prepared to build a $75,000 home on it. The contractor ran the foundation columns down twenty feet below the ground's surface, believing they rested on solid rock. The house was completed. Several months later immense cracks appeared in the walls after one side had begun to sink. Either the foundation had played traitor or the contractor hadn't been vigilant enough. At any rate, the fine home was practically ruined.

*A Foundation Built in a Duck Pond*

In another case, several doctors purchased some ground on which to build a hospital. Before buying they had received an estimate from an architect as to the cost of the building. They carefully reckoned the total expenditure necessary. The architect, of course, had counted on an ordinary foundation, not knowing they had a particular site in view. As soon as work was started, it was found that the contractor would have to go very deep for a foundation. And he did go deep, and deeper and deeper. At length he stopped—at something over forty feet. This abnormal foundation added several thousands of dollars to the cost of the project. Neither the doctors nor the real estate agent had known that seventy-five years before the site had been a duck pond!

Cases of expensive foundation problems could be multiplied indefinitely, and all point the same moral: *Know the foundation before you buy.* Most subdividers will agree to bore a test hole on any site you are seriously considering. If the seller won't do this, have it done yourself; it will cost only a few dollars. Much can be learned by talking with the owners of homes in the neighborhood, who are likely to know of any foundation troubles in their blocks.

As for improvements—such necessities as electricity, water, sewage, gas, and telephone service—beware of promises. These things certainly should be supplied by the seller if possible. If you undertake to furnish them yourself, you likely will have an interesting but costly experience. Unfortunately there are some real estate men who promise more than they deliver, but keep within the law and continue in business. Small water pipes, thinly graveled streets, inadequate sewage facilities—these so-called improvements do not make a first-class neighborhood.

See that the conveniences furnished with your lot are the best of their kind. A paved street, a cement curb and sidewalk, and a graveled alley in the rear are desirable improvements. In many of the best subdivisions the telephone cables are put in the alleys (so as not to have unsightly telephone poles lining the beautiful, curving streets), and artistic iron lighting posts are erected in front of the homes. Garbage deposit boxes are placed in the alleys. A wide space is left between curb and sidewalk on which grass and shrubbery are grown.

*Concerning the Terms of Payment*

The proper size of your lot depends to a large extent, of course, upon the size of your house. If you plan building a roomy two-story or a spacious bungalow, you will want a rather large lot (at least a wide one); otherwise your home will look somewhat like a fat man in tight-fitting boy's clothes. The best subdivision companies take strict precautions on this point; they specify the various sizes of lots on which houses may be built. A broad, deep lot with wide, terraced lawns enhances the beauty of any home. If your site is narrow, the house of your neighbor may be so close to yours that, in the vivid expression of one realtor, "he can hear you think," and you enjoy no privacy. Standard lot sizes vary in different cities, but the commonest dimensions appear to be 40 by 100 feet. In certain western and southern cities the standard is 50 by 100—certainly a more sensible size for the average bungalow or cottage of five rooms. A little extra money given for a few additional feet is usually well spent.

Most buyers are eagerly interested in the terms of payment. Even today people are found who think that real estate is sold only for cash, whereas not one sale out of a dozen is a cash transaction. The installment plan method of selling real estate is practiced in a multitude of forms. Lots are sold with a first payment of from one dollar to five hundred dollars, the determining factor being the quality and price of the site. In most cases, a period of from three to five years is given in which to complete the payments of interest and principal, which must be made at stated intervals—weekly, monthly, semiannually, or annually.

As a rule, real estate can be bought at cheaper prices if all cash is paid.

The question of a good title is a dreadful bugaboo.

The best protection is a good lawyer.

# Why Is Food So High?

(*Concluded from page 15*)

vegetables, but this is only five per cent; while another five per cent occurs from shrinkage.

There is also a definite waste due to the loss occurring from rapidly varying prices. Flaws in distribution and demand are responsible for this condition. The cost of delivery and credit extended to the consumer also adds to the cost of food.

At the other end of the line the farmer can do much to reduce the cost of marketing food products.

The ghost of Economy House.

The shipment of farm products in car lots would save much waste and be more efficient. The rates on car lots are less than on smaller quantities. Car lots move with quicker dispatch.

Individual farmers frequently do not have sufficient quantity to make car lots of a given farm commodity—hence the necessity of coöperating with neighbors and pooling resources. In many farm communities it is difficult to obtain any quantity of a given uniform farm product because of the great number of varieties grown. The price is consequently reduced a few cents per bushel or pound and the farmer is the loser thereby. There is also economic waste due to lack of standardization.

It is quite clear that much of the high cost of food is due to the presence of preventable and economic waste in the production, transportation and marketing of farm products, and this waste must be eliminated before the problem is solved. It can only be eliminated by the united efforts of the consumer, producer, and distributor.

# A Dance A Week

## THE SCHOTTISCHE

The dance is of Polish origin, and like almost all of the old dances came through France and England to our own country. This dance is said to have been introduced into Paris by Markouski, a Polish dancing instructor, about 1850. The schottische became popular in the United States, and even today is often found among the modern dances. Among the earlier schottisches was one which starts with left foot to the left side and executes a *slide, close, step, hop* (*on left*); and a *slide, close, step, hop,* (on right) to the right side. Then follows a *step, hop,* turning. A *step hop* means to take a step, then a hop, on the same foot. Count 1 and 2, 3 and 4.

THE DANCE—Metronome 152 Waltz Position

Slide left foot to left side, count 1; Close right foot to left, count 2

Slide left foot to left side, count 3; Close right foot to left (raised), weight is still on left foot, and at the same time raise and lower the heel of the left foot, count 4 (1 bar).

Repeat the same movements with the right foot to the right side.

Slide right foot to right side, count 1; Close left foot to right, count 2

Slide right foot to right side, count 3; Close left foot to right (raised), at the same time raise and lower the right heel, count 4 (1 bar).

SECOND PART—Execute four *step hops* turning, starting with left foot and alternating. Repeat all from the beginning.

### THE THREE SLIDE SCHOTTISCHE

Metronome 152 Waltz Position 4/4 time

This dance is performed by taking three slides and a half turn to the left, and three slides and a half turn to the right.

Starting with the left foot to left side, take slide close, slide close, slide close, step (backward turning). Repeat to right side with right foot; slide close, slide close, slide close, step (forward turning). Repeat the entire dance.

### THE FIVE STEP SCHOTTISCHE

Waltz Position Metronome 152

In 1871, E. W. Masters, a Boston dancing instructor, arranged the FIVE STEP. This dance consisted of five steps in four counts, and became very popular in the New England states. It was rather difficult for the average dancer to master. In the days of its popularity, a dancer who could not perform the "five step" schottische was not considered "finished."

THE DANCE—Slide left foot to left side, count 1; Draw right foot to left, count 2

Step back with left foot, count 3 (turning); Slide right foot to right side, count, *and*

Draw left foot to right, count 4 (1 bar); To the last two steps allow one count

Repeat all with right foot; Slide right foot to right side, count 1

Draw left foot to right, count 2; Step forward on right foot, count 3

Slide left foot to left side, count *and* draw right foot to left, count 4 (1 bar)

Repeat all from the beginning. Remember to count the dance 1-2-3 *and* 4. *Allow one count to the last two steps.* Turns are made as in the waltz.

### THE MILITARY SCHOTTISCHE OR THE BARN DANCE

First part, open position. Second part, waltz position. The Barn Dance derived its name from a popular schottische called "Dancing in the barn." The first part is open position. Partners stand side by side, gentleman's right hand at lady's waist, her left hand resting upon his right arm. Each starts with outside foot.

FIRST PART—Step forward on left foot, count 1; Draw right foot to left (a little back), count 2; Step forward on left, count 3; Hop on left, count 4 (1 bar)

*Repeat* starting with right foot forward; Step forward on right, count 1

Draw left foot to right (a little back), count 2; Step forward on right, count 3

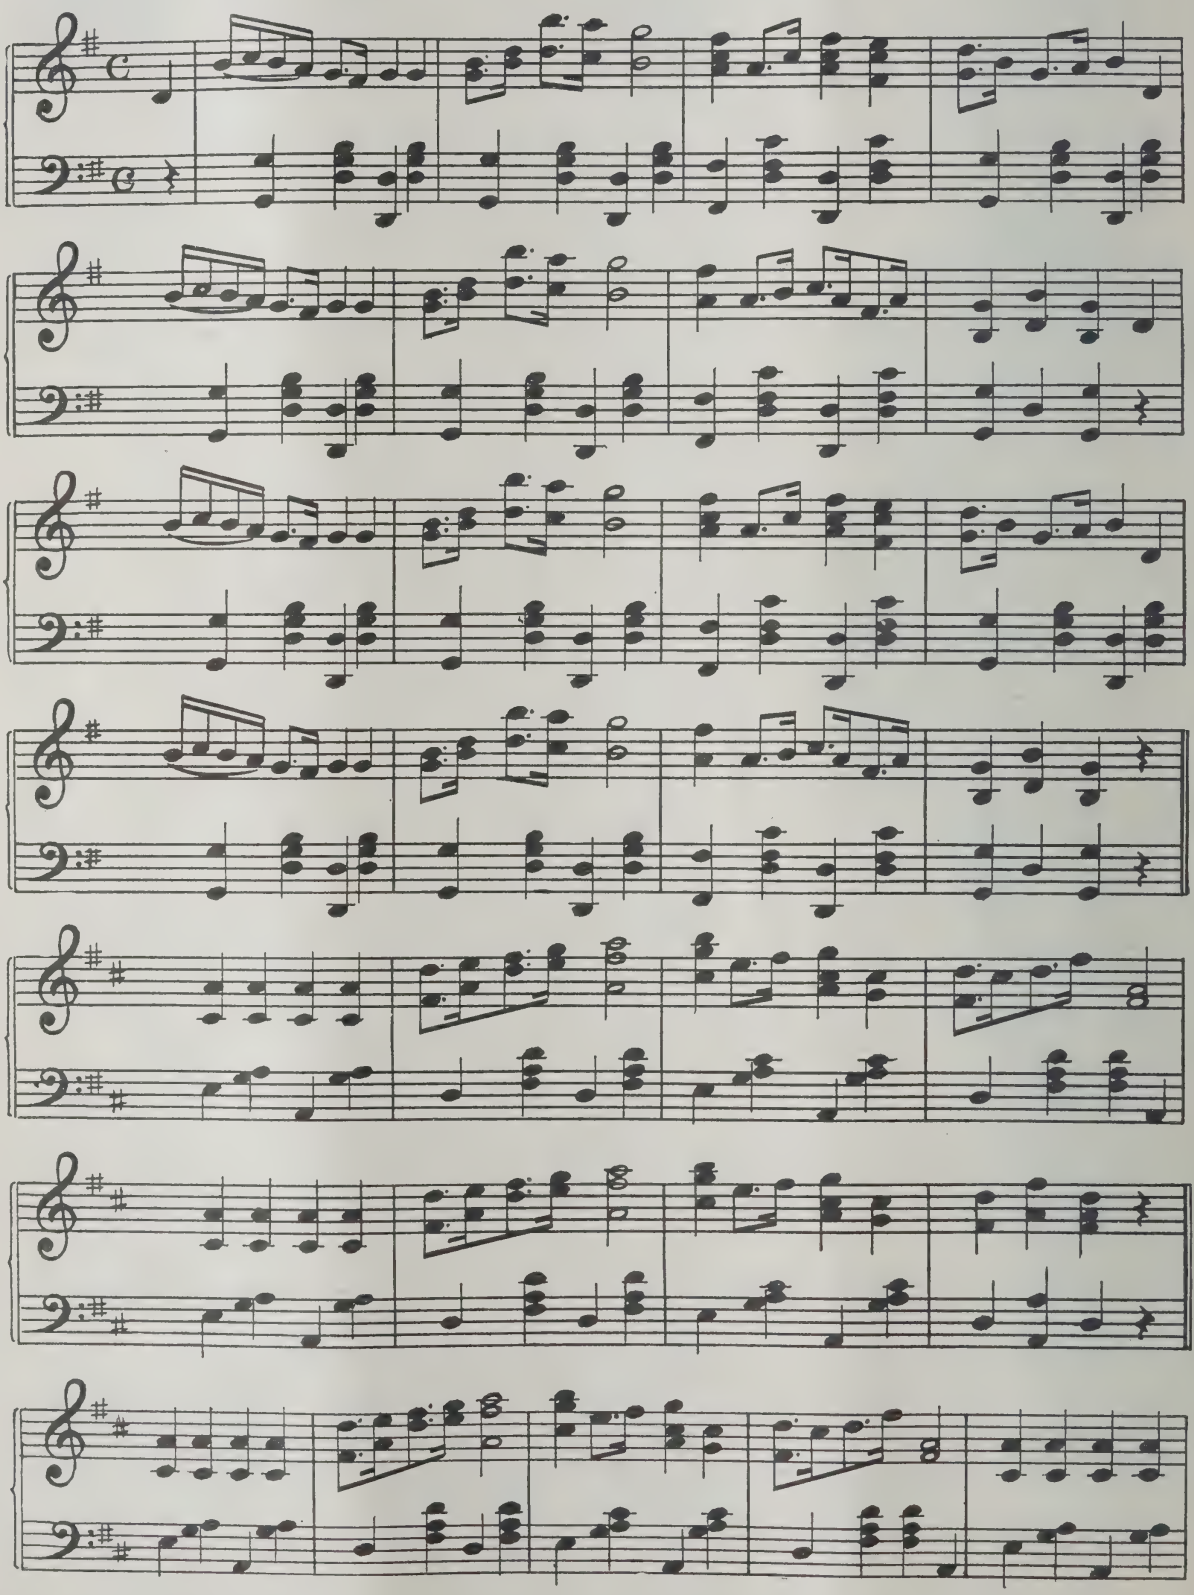
Hop on right, count 4 (1 bar).

SECOND PART—Waltz position, making a ¼ turn each time on each step.

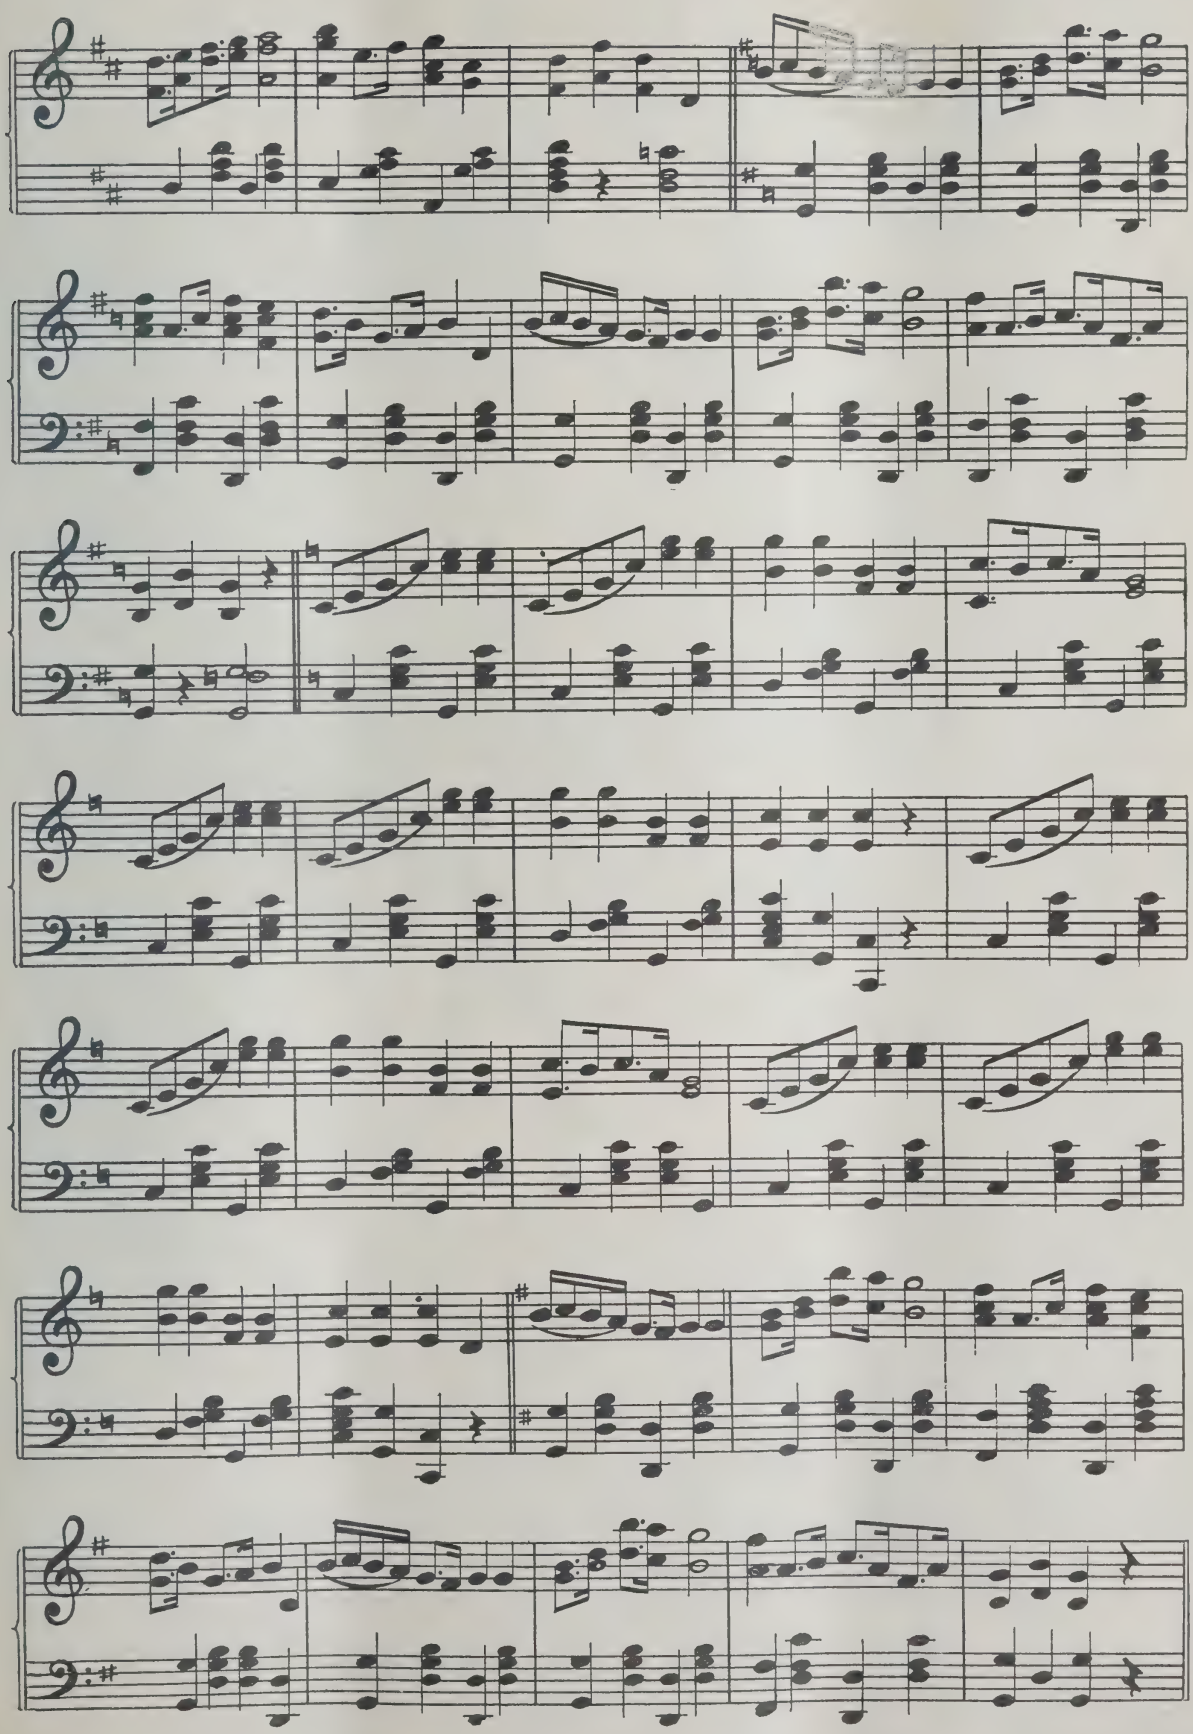
Step back on left foot, and hop (same foot) count 1-2

Step forward on right, and hop, count 3-4 (1 bar)

Step back on left foot, and hop, count 5-6 (1 bar)



Step forward on right foot and hop, count 7-8; *Repeat* all from the beginning.



Briefly the entire dance is: *step, close, step, hop* (with left foot); *step, close, step, hop* (on right foot). All steps are forward. In the Waltz position all steps are turning. NOTE—the first part may be danced by starting with the left foot, and take three short running steps forward, left, right, left, and a hop on left foot, count 1-2-3-4. Repeat starting with right foot, three short running steps forward, right, left, right, and hop on right foot, count 5-6-7-8. Followed by four *step hops*, turning.

"Good Morning" is the new Ford book on the Old American Dances. 75 cents a copy. Send orders to Dearborn Publishing Company, Dearborn, Michigan.

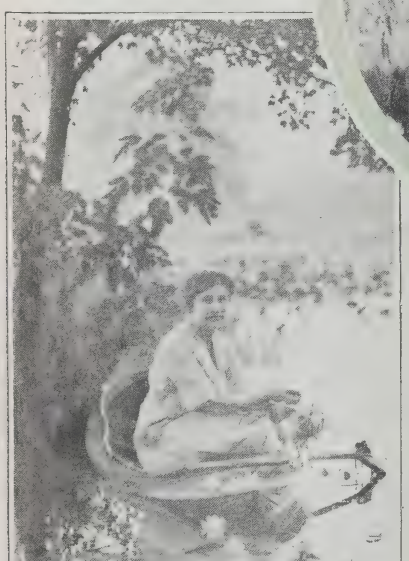
# Lady Makes a Living Raising Lilies

## Annually She Sells Thousands of Flowers and Roots From Her Twelve-Acre Garden

By GEORGE H. DACY



The Fowler lily garden is one of the largest in the world, consisting of twenty-nine ponds that cover twelve acres of water surface.

HOW would you like to be the owner of the largest water lily farm in America?

That is the position of Mrs. Helen Fowler, of Washington, who succeeded her father, W. B. Shaw, some years ago as operator of a huge lily farm at Kenilworth, a District of Columbia village, only six miles from the White House.

Mrs. Fowler took over the business in 1912 at the request of her father who wished to retire. At that time all Mrs. Fowler knew about lilies was that they were beautiful and that their production and sale had built up a comfortable little fortune for her father.

Posthaste, she began her study of lilies and other aquatic plants. She experimented with the plants in the greenhouses and ponds. She read ponderous botanical treatises and brochures. She consulted with experts of the National Department of Agriculture. She learned most of all from her daily work with the extraordinary water plants which like human beings close their blooms and go to sleep at night only to awaken and open up their blossoms in all their splendor the following morning, delighting the eyes of all.

MRS. HELEN FOWLER,
Washington lady who owns and runs the world's largest lily farm.

Specimens of the *Victoria Regia* which Mrs. Fowler grows. The plants are thirty feet square and the individual leaves are three feet to six feet in diameter.

The story of the inception and development of the lily farm is an interesting one. Mr. Shaw, a native of Maine, many years ago accepted a Government position and moved to Washington, purchasing a thirty-acre farm near Kenilworth, District of Columbia. There was one small pond on the tract and, for his personal pleasure, the owner introduced a number of specimens of the white water lily from Maine and set them out in this pond.

The plants developed rapidly. Mr. Shaw stocked a second pond with lilies. Soon the flowers were so abundant that the amateur grower had more than he could give away. One morning, for the fun of it, he carried several large bunches to Washington and showed them to a florist who immediately purchased them and ordered as many more as the Shaw ponds could produce.

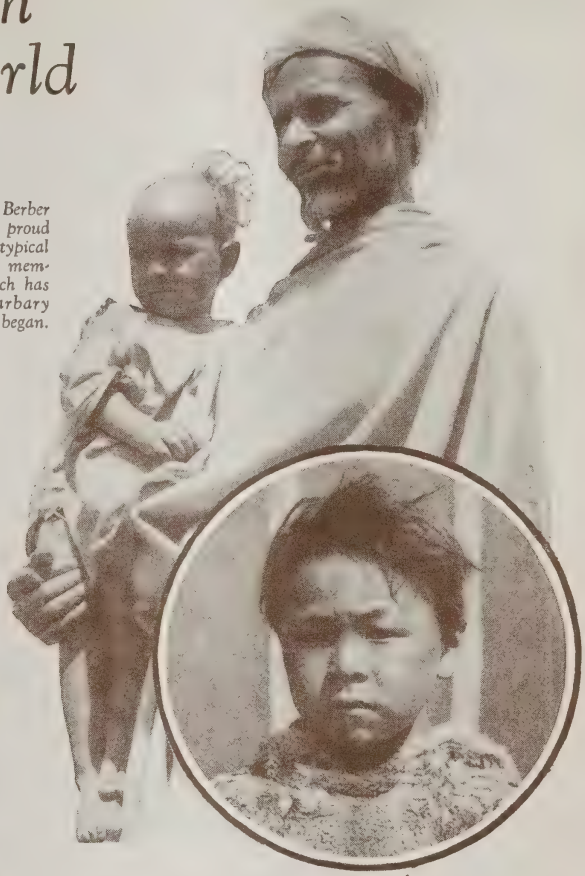
Sensing the commercial possibilities of lily farming, Mr. Shaw then began to devote special attention to the improvement and expansion of his midget water gardens. He set out varieties of every type that he could obtain, and made ponds where the plants could grow. He harnessed the prolific springs of his neighborhood as natural sources of water supply to feed the ponds. In a practical and systematic manner, he laid the foundation for a remarkably profitable industry in aquatic plants. The first year, he only cleared $125 from his lily-raising enterprise. Steadily, ever since, however, the business has been booming until, nowadays, during the height of the season, Mrs. Fowler markets from 3,000 to 5,000 lilies daily in addition to selling thousands of roots that bring from 25 cents to $25 apiece, and approximately 3,000 aquarium plants a week throughout the year.

The lily farm covers twelve acres of water and upland garden and consists of twenty-nine artificial ponds which are productive of one hundred different varieties of lilies of every species known to modern botany.

"Water lilies are the easiest of all flowers to raise," Mrs. Fowler said. "All they require are unobstructed sunlight, plenty of water and a rich soil such as often obtains at the bottom of sluggish streams due to the decomposition of leaves, grasses and weeds. The tender sorts are started in pots in the greenhouse early in March and transplanted in the ponds about the first of June.

"How do you harvest the flowers?" I asked.

"For commercial purposes, you have to handle the water lily entirely in the bud," responded Mrs. Fowler. "My pickers start out in their boats at five o'clock each morning so that they can pick the lily crop before any of the buds begin to open. We cut, sort, wash and pack the lilies immediately after they are picked. The aim is to have the lilies open at the time when they arrive on the city market, so that prospective buyers will be able to see them in all their beauty.



"If properly handled, a water lily will last as an ornament for seven days after it reaches the ultimate purchaser. The stem should be severed as soon as the buds reach their destination. The flowers should then be floated in shallow dishes of water, when they will open every morning and close at night."

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week deals with the question of "making men moral by legislation."

*Boston is preparing for earthquakes!* Absurd? Not at all. In colonial days temblors were common in New England, but the loss of life was slight because the population was small. Quakes come in cycles. Recurrence today might mean disaster. Hence, without unduly alarming the people, the Engineering-Economics Foundation is laying plans against possible emergencies. Authorities say that while quakes cannot be prevented, they may be robbed of much of their horror. (p. 3)

Taxes do not come from property. *They come from income.* Property in itself produces nothing. Wealth comes only when somebody goes to work. Property is a result, not a cause. Labor and management combine to make wealth. But somehow our lawmakers seem unable to comprehend this. Their sole object is to get money somewhere, *anywhere*, and so they impose indirect taxes and direct taxes and inheritance taxes and nuisance taxes and all the rest. (p. 7)

What's wrong with our schools? Well, for one thing, the supercilious attitude assumed by some parents. "Public schools may be all right for others, but *our* children . . . " You know the rest. Here is an article that exposes the pernicious fallacy of such a pose. It is written by a mother, whose children all attend public schools. (p. 8)

An *Independence Bible?* Right. The spirit of independence waxed strong among the members of the Continental Congress, so strong, in fact, that they wanted a Bible all their own. The *King James* version smacked too much of unpopular England. The task of translating a purely American Bible fell to Charles Thomson, who first read the Declaration of Independence to the populace. (p. 12)

Your trip abroad this summer—will it prove expensive? Not necessarily; except for one costly item—American passport red tape. The British subject pays his government $2 and receives a document that entitles him to enter nearly all nations of the earth without extra charge. We must pay Uncle Sam $10 for the privilege of leaving the country, and then shell out other $10 bills to every land we visit. (p. 4)

A clergyman writes: "I feel that having enjoyed THE DEARBORN INDEPENDENT so long, I ought at least acknowledge the favor and give a word of appreciation.

"I say that I have enjoyed reading your magazine, especially your editorials and Mr. Ford's Page which deals with many subjects in simple and non-technical phraseology. For instance: some time ago it made clear to my mind as never before, the difference between stock speculation and business. I find the articles not only informing to myself but I can illustrate some point in a sermon with them."

A cause, especially a lost cause, will never want for adherents. So it is with pretenders. No matter how wild or preposterous a tale is told, the claimant to distinguished identity is bound to attract followers. F. L. Black, exploder of the Booth myth, traces the history of some of the better known pretenders, and explains the secret of their claims. (p. 13)

They come, they see, and they return home, laden with American money, to criticise American ways. Small wonder British author-lecturers, since the days of Dickens, have not been overly popular in this country. But all of them are not of this hypercritical bent, and those who are not are more than welcome here. Of this number is Hugh Walpole. (p. 2)

Have you ever wondered at the seeming contradictions that made up Woodrow Wilson's character? Though he was the center of more searching publicity than any other man of his time, he yet remained an enigma to most of us. Only now are the true explanations coming. This article should help you to a better understanding of the war-time President. (p. 6)

The day of the professional humorist is nearly done. So says Tom Masson, and he should know for he served for years as editor of one of the leading humorous publications. Further than this he has compiled anthologies of humor, and he is personally and intimately acquainted with most of the wits of the generation. His analytical dissection of their work is not only interesting but authoritative. (p. 16)

The old bear of the art world. This has long been the popular conception of Joseph Pennell, famous etcher and critic. But now a friend steps up to his defense. His cynicism, his sharpness, she says, are merely defensive armor for a sensitive nature. (p. 20)

The League of Nations at last seems to be assuming its natural and destined shape; pretenses are being dropped; the cloak of hypocrisy is being stripped off by nationalistic desires. Read the editorial, "A Latin League." (p. 10)

The "Negro Problem" is one of the most important facing the American people. We are all fairly familiar with the Negro's viewpoint. Next week THE DEARBORN INDEPENDENT will present an analysis of the present-day attitude of the South.

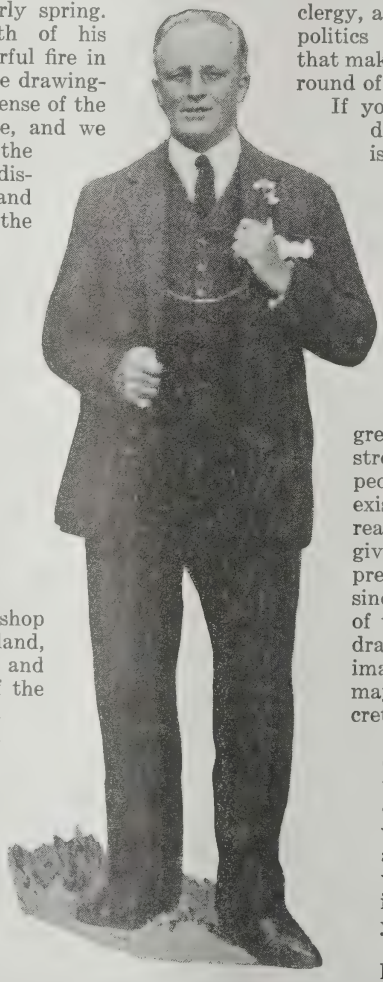
# The Man Without Red Hair

## Hugh Walpole, Noted Writer, Explains Why He Goes A-lecturing to America

By HENRY ALBERT PHILLIPS

Home of Hugh Walpole in the north of England, where the writer does the greater part of his work.



HUGH WALPOLE is in no sense—like his most recent fiction creation—a *Man With Red Hair*. As a matter of fact, Mr. Walpole is in imminent danger of soon becoming a man with little or no hair at all, it is thinning so rapidly. But of all the gracious authors of distinction that I have met, commend me to Hugh Walpole.

He received me in his luxurious but pleasant flat—they call apartments "flats" in London—in Piccadilly, overlooking Green Park, one chilly morning in early spring. Between the warmth of his manner and the cheerful fire in the grate in his sizable drawing-room, I soon lost all sense of the unfriendly fog outside, and we fell to chatting about the things that were most disturbing to his mind and the sort that one of the wrong type would be likely to get "red-headed" over.

Hugh Walpole has always lived in an atmosphere that peculiarly fits a literary-minded man. Furthermore, he has been clever enough to improve the opportunities at hand, by actually using them, in many notable instances, as the background of his work.

As the son of a bishop of the Church of England, Mr. Walpole was born and brought up in four of the cathedral towns which he has so skillfully and realistically employed as the background of that revealing novel, *The Cathedral*.

Perhaps Anthony Trollope alone, in his Barchester stories, has given us a more searching study of the life that goes on in an English bishop's household, the relations with his clergy, and all the ecclesiastical politics and petty bickerings that make up the really exciting round of daily life.

Hugh Walpole.

If you will recall, the cathedral town of Polchester is constantly referred to, and not a few readers believe that Polchester is actually on the geographical map:

"No, Polchester is a composite of all the cathedral towns in which I lived as a child," said Walpole. "It grew in my mind—its streets and houses and people—until it came to exist as something very real. I hope that I have given my readers the impression that it *is* real, since it is the ambition of the fiction artist so to draw the creations of his imagination that they may finally exist in concrete form. I have always had a fear that my cathedral towns stories were faulty in that I did not write them with enough sympathy, although I wrote them with the greatest feeling of sincerity, mind you."

He paused to light his pipe, and looked into space a moment, as though to glimpse Polchester and make sure he was saying the right thing about it.

"Yes, to write about environment, one should love it. But I hated the cathedral town and all it stood for, so it was not as good a picture as it might have been. I write much better about London, because I love it."

He looked out of the window, down toward Piccadilly Circus, and I could see in the slight softening of his expression just what he meant to say.

"If you will read *The Old Ladies*, you will understand what I mean; there's the unpleasant side of it."

In addition to his many American readers, Hugh Walpole has another potential link with America. He is, I have been led to understand, the most popular—and fancy-priced—of the many English lecturers who occupy platforms throughout the length and breadth of our cultural community. There has been criticism, usually from those who did not attend or enjoy the lectures, about these Britishers coming over here and "mulcting" the American public. The American public continues to flock to hear them, however. I wanted to hear Mr. Walpole's side.

"Well, really," he began with hesitating reluctance. "So there is a feeling that we Englishmen go there to get money?"

He was neither annoyed, nor ill-natured. I would be inclined to say, rather, that he was good-natured about it.

"Well, it would be futile for me to say that I am not aware of that. Any Englishman—or American, or Hottentot—would be an imbecile to go through with one of your lecture tours and not consider

(Concluded on page 19)

# When May Boston Expect Its Next Earthquake?

## Engineers Lay Plans for Averting Disaster if Temblors Again Rock New England Region

By
JANET MABIE

Dr. Hollis Godfrey, president Engineering-Economics Foundation.

WHILE earthquakes cannot be prevented in any section, the problems they occasion, of property damage and loss of life, are solvable. For the orderly solution of such problems the Engineering-Economics Foundation—of which Dr. Hollis Godfrey is president and many eminent scientists are members—has appointed notable civilian committees in the New York-New England-Quebec area which has reached the highest degree of earthquake expectancy of any year in its history.

These committees will coöperate with official boards on municipal emergencies to make efficient contact between the people and the officers charged with their protection in time of emergency. The function of the official boards is twofold: action in event of great disaster and education. It is by means of education that the public will be afforded protection, through organized activity on the part of the agencies intrusted with the multiple tasks of quelling panic in time of emergency with the measured means of safety and relief.

Just as the problems of health and sanitation have been solved to a great extent by medical men and sanitary engineers, the "problems of emergency," such as earthquake hazard, conflagrations and tornadoes, can be successfully solved by engineering economists. From 75 to 90 per cent of protection from the whole field of "emergency hazard" can be made available to the populace by research.

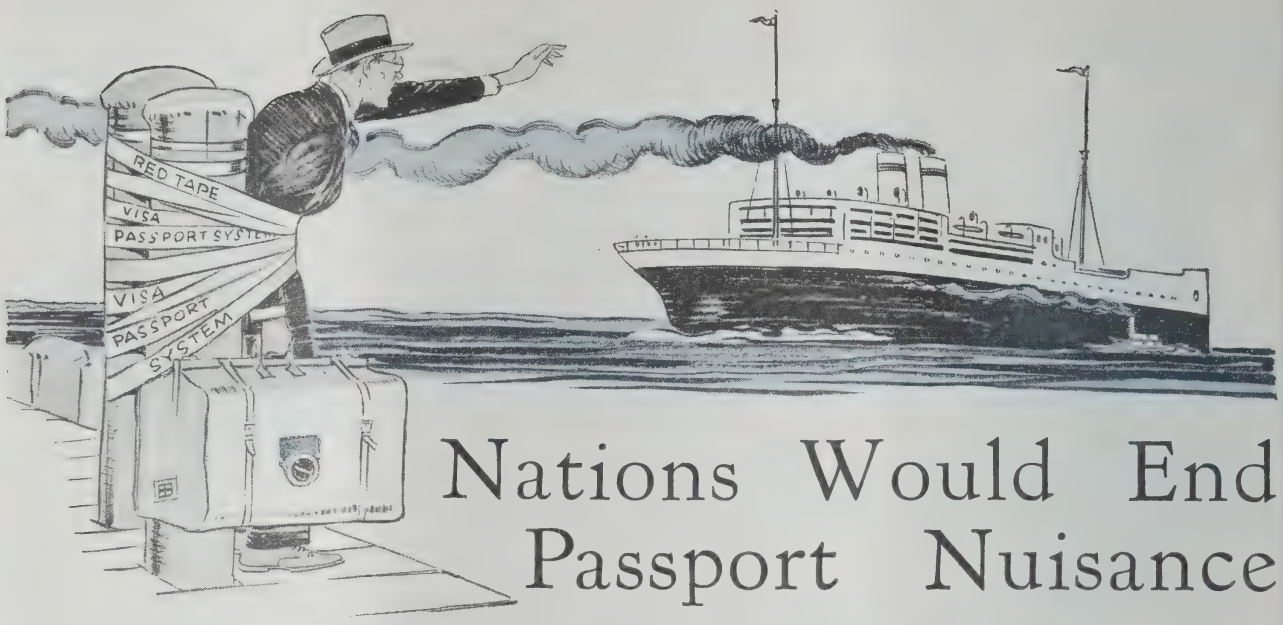
The Engineering-Economics Foundation has devoted exhaustive research to the effects of emergency upon crowded centers, particularly such sections as are inhabited by non-English-speaking peoples.

In a day when such vital appurtenances of material life as water, gas, and electricity function largely underground, it is the duty of every responsible citizen, in all areas which may be affected by shock, to examine the problem of earthquake expectancy and hazard, and to secure education in available means of protection against loss and destruction by shock in the same intelligent spirit with which it is customary to examine the necessity and to obtain the protection of insurance.

In an earlier day it did not matter so much that the well and the pump were upset for a space. No floods resulted from broken water mains and there never was a sufficient quantity of whale oil on hand to cause conflagration. But today the whole pattern of modern life makes the effect of earthquake complex, and it is the part of sheer wisdom to prepare for conditions it precipitates in advance of emergency.

There are amenities of public conduct in modern times regarding earthquake concerning which there should be general education, and which if observed afford a means of dissipating alarm. Education enables the men of relief organizations to plan wise and useful preparedness for the specific necessities arising in time of earthquake. Construction, engineering, the functions of protection vested in all public and private economic services, of commerce and industry, public health, public security and the prevention of panic are all the inevitable result of education.

Before the World War the Engineering-Economics Foundation was conducting assiduous researches in the conduct of man under conditions of emergency.



The Foundation—Dr. Godfrey points out—never conducted researches merely to advance knowledge concerning the causes of disaster. It never undertook the experiment of predicting either time or geographic location of the occurrence of disaster. As Dr. Osler, of Johns Hopkins University—thus changing the whole trend of post-graduate study—was pioneer in the field of studying, not disease, but man under conditions of disease, and as Professor William T. Sedgwick, of the Massachusetts Institute of Technology, was a pioneer in the study of man as endangered by unsanitary conditions, so Dr. Godfrey and the Engineering-Economics Foundation were pioneers in conducting organized research of man under conditions of emergency with the further purpose of placing their important findings at the educational disposal of the public.

The World War came and the work of the Foundation had become well organized and was functioning explicitly according to its survey of peace-time problems of emergency. This made it possible for its first great natural achievement to be performed. Immediately its entire body was placed at the country's disposal, to serve throughout the remainder of the war as the staff of its president, who became Federal Commissioner of Education of the United States Council of National Defense, by appointment of President Wilson. Its entire resources of records, based on the various observations of men under conditions of conflagration, flood, famine, tornado and earthquake, were placed, the sole existing, complete records of civilian emergency, at the disposal of Federal agencies to which were allotted the trying and imperative problems arising out of summary conditions incident to war.

The war-time record of the Foundation is another story. In the afternoon of Armistice Day Dr. (Continued on page 26)

### THE CAUSE OF EARTHQUAKES

Gradual movement of the solid earth is taking place constantly though very slowly in many lands. This is due to the constant shrinkage of the earth's interior, to the transfer of lead when the mountains are worn down and cast into the sea, and to other causes of a more complicated nature. For a time the elastic crust yields to such stresses, but in so doing it accumulates strain. Finally the last straw breaks the camel's back: somewhere the earth's crust violently ruptures. The cracks thus made extend for many miles across the earth's surface and are known as faults.

# Nations Would End Passport Nuisance

## Visa Regulations Impose Hardships on American Travelers

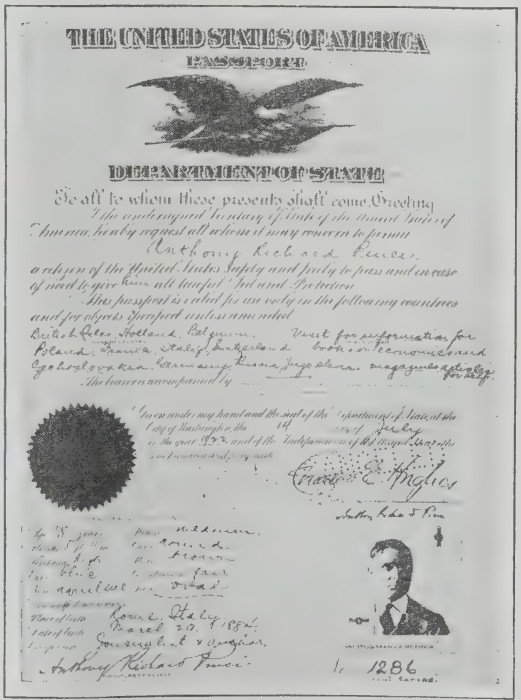
By A. R. PINCI

ON MAY 12 of this year, the League of Nations Passport Conference, to which the United States has been invited, will be held at Geneva. The conference has been called under an Assembly resolution, which is in part as follows:

> The attention of all Governments is drawn to the special importance of the Conference on Passports. Steps will be taken for the elimination, insofar as is possible, of the passport system, and the mitigation of the disadvantages and the expense which the system entails for relations between peoples and for international trade facilities.

What the agenda proposes is the abolition of the passport system, but conceding that this is a remote possibility, a series of alternative proposals—chainwise—are suggested, in the hope that some relief will be afforded both in the use and cost of that technically simple but officially complicated adjunct of the traveler. By strange coincidence, although the passport is a Continental discovery, it remained for the United States to turn it into an economic nuisance.

The present passport system is condemned by the Foreign Commerce Department Advisory Committee of the Chamber of Commerce of the United States, the Merchants Association of New York, Frank C. Clark (said to be the dean of American tourist agents), Professor W. H. Shephard, of Minnesota (speaking for a group of professional Americans), many other important bodies, and thousands of travelers.



The present administration favors some sort of relief, which has the backing of the Secretary of State and the Secretary of Commerce. A year ago a favorable report on the Fish Bill, to permit the lowering or the abolition of passport visa fees under certain conditions, was ordered by the House Committee on Foreign Affairs, but it failed to pass. Under the provisions of the Fish Bill, the President would be empowered to take similar action in the case of non-immigrants coming to the United States from countries of which they are citizens and which are granting reciprocal rights to American citizens of a like class. Several governments have gone so far as to announce their intentions to change their passport regulations as soon as the United States is ready to reciprocate.

I have had much experience with passports, from the holder's standpoint as well as from that of visaing them. I have used them at the three periods most commonly used for the purpose of comparison—ante-war, post-war, and recent. The best description of the passport is this: Before the war the passport was not a point for discussion any more than the traveling ticket proper, whereas now it is the alpha and omega of travelers, foreign and American, who have anything to do with the American system, and is cursed in as many ways as language permits.

Members of Congress, especially those responsible for the present state of affairs, explain the motive for existing legislation in many ways. The fact is that Congress has red-taped a function which is in reality extremely simple, and has transformed an inexpensive credential into a revenue-bearing source.

A passport and a visa are two different things. A passport without visa is serviceable in certain places, but a visa cannot be said to exist without the passport, as the latter is the document which is rubber-stamped, numbered, and signed by a foreign consular officer.

Passports are issued to foreign nationals by their respective governments for a nominal sum.

THE UNITED STATES OF AMERICA

PASSPORT

DEPARTMENT OF STATE

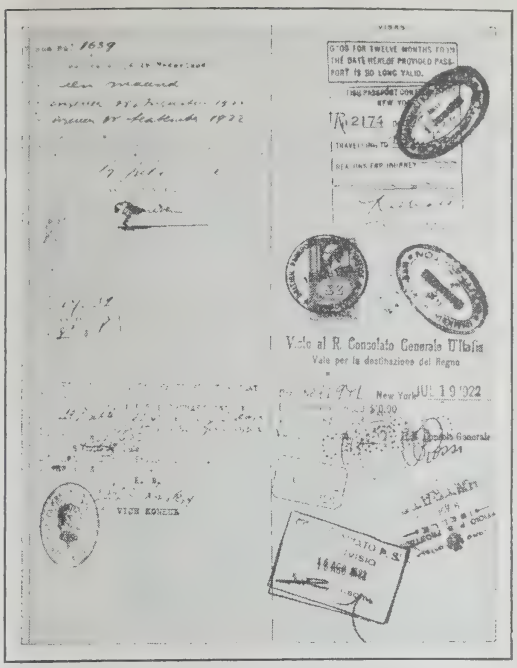
To all to whom these presents shall come, Greeting:
The undersigned Secretary of State of the United States of America hereby requests all whom it may concern to permit

Anthony Richard Pinci,

a citizen of the United States safely and freely to pass and in case of need to give him all lawful aid and protection.

This passport is valid for one entry in the following countries and for objects specified unless sooner revoked

British Isles, Holland, Belgium, Germany, Denmark, Sweden, Norway, Russia, Finland, Poland, Austria, Hungary, Czechoslovakia, Roumania, Jugo-Slavia, Bulgaria, Greece, Turkey, Egypt, Palestine, Syria, Mesopotamia, Arabia, Persia, Afghanistan, Siam, China, Japan, Korea, Manchuria, Philippine Islands, Hawaiian Islands, Panama Canal Zone, Mexico, Cuba, Haiti, Santo Domingo, Nicaragua, Costa Rica, Honduras, Salvador, Guatemala, Canada, Newfoundland, Australia, New Zealand, Tasmania, Union of South Africa, Liberia, Abyssinia, Morocco, Algeria, Tunis, Tripoli, Egypt, Sudan, Belgian Congo, Portuguese East Africa, Portuguese West Africa, Madagascar, Uganda, Kenya, Nyasaland, Rhodesia, Angola, Mozambique, Senegal, Ivory Coast, Gold Coast, Nigeria, Sierra Leone, Gambia, Togoland, Cameroon, Fernando Po, Spanish Guinea, Spanish Morocco, Spanish Sahara, Rio de Oro, Canary Islands, Madeira, Azores, Cape Verde Islands, Portuguese Guinea, Portuguese India, Portuguese Timor, Macao, Dutch East Indies, Dutch West Indies, Dutch Guiana, Curaçao, Aruba, Bonaire, Saba, St. Eustatius, St. Martin, Surinam, Java, Sumatra, Borneo, Celebes, Bali, Lombok, Timor, Flores, Sumbawa, Sumba, Ceram, Amboina, Banda, Ternate, Tidore, Batjan, Halmahera, Obi, Bouru, Ambonia, Aru, Tanimbar, Kei, Misool, Waigeo, Salwatti, Papua, Netherlands New Guinea, Netherlands Timor, Netherlands Antilles, Netherlands Indies, Netherlands Guiana, Netherlands Antilles, Netherlands Indies, Netherlands Guiana, Netherlands Antilles, Netherlands Indies, Netherlands Guiana



The average European can travel all over the Continent and a goodly part of the remaining world at little passport cost. Were it not for the fear of the unemployed traveler migrating, foreign passport conditions would be even easier and simpler.

An American passport costs $10. An American visa on any foreign passport costs $10. Important nations charge $10 for their visas on American passports. A lower American fee would be immediately reciprocated by foreign authorities. As to why Congress should decree a $10 charge for an American's privilege to travel away from the United States is a conundrum of the kind with which Washington abounds.

In 1919 it cost me $2 to obtain my American passport. Foreign visas likewise totaled altogether a similar sum. In 1922 a new passport cost me $10; a few visas raised the cost to about $100. In 1925 a new passport was required; visas pyramided the cost on a straight $10 ratio. Thus the American Government, on the plea of making passport control self-supporting, has created a marvelous addition to our invisible exports. It is unofficially estimated that in 1925 Americans paid about $30,000,000 to foreign governments for their visas.

Certain authorities claim that foreign countries would have been within their rights to charge $18 plus $5 to American visitors, the calculation being, in the first case, the equivalent of the visa fee of $10 and the head tax of $8, and the second corresponding to our war tax of $5 a head upon travelers leaving the country. That they have not done so is proof of knowing how to govern well, and not to kill the goose that is laying this new golden egg for them, for authorities abroad understand that the growing tide of American travelers abroad originates with people of moderate means.

The proposal to remove the visa fee of $10 is of no practical advantage, because the American idea is to bar immigrants from the non-paying privilege. The number of non-immigrant foreigners coming to the United States is insignificant in a fee-producing sense. It would seem that our present immigration laws have, or are supposed to have, eliminated some of the objections connected with the original quota law; hence it seems to me that a coefficient of the new immigration act is a substantially lower visa fee and the abolition of the head tax.

Another page of the passport used by Mr. Pinci.

No foreign government should take seriously any American proposal which, in simplifying passport control, did not take into consideration abolishing the export war tax—for such it is—and readjustment of the head tax; but I am informed that on either of these points neither the Geneva passport conference nor its participants will offer obstruction on a tooth-for-tooth basis. Yet it is clear that the abolition of the $10 American visa would be a straight saving of that sum to Americans without in any way saving foreigners coming over here. It would reduce the foreign visa charges paid by Americans on their passports, but would mean no corresponding saving to the emigrant bound for the United States. Non-immigrant foreign visitors would be obliged to pay $13, $8 head tax and $5 war tax; immigrants would pay $18, visa and head tax.

In general, passports are used chiefly by two classes, commercial and tourist. American firms conducting an over-sea business are countless; they are sufficiently taxed at home without adding the cost of passports and their visa fees. It is true that a passport is good for two years through extensions, that some visas are good for one year, and that two, three or four voyages in one year would cut the cost pro rata.

Certain foreign governments have granted free visas to responsible American business men attending trade and other meetings within their borders. Not only should the American Government devise a special passport for the use of business and professional men going abroad in connection with their work, but the International Chamber of Commerce should sponsor universal passport controlled by, say, annual renewal on a semi-automatic basis.

Apart from the excessive cost and retaliatory penalties which the now unbusinesslike American passport has imposed on its users, there is the ritual which attaches to obtaining the document. The law does not specify many inhibitions, but these have been provided by State Department regulations, and where these fail the officious passport personnel volunteers. When one enters a passport office it seems as if one were in a police station crowded with characters under suspicion and obliged to account for their actions and possessions.

My decision to (Continued on page 23)

# Woodrow Wilson—Not Too Good and Not Too Wise

## President's Scoto-Irish Ancestry Explains Various Apparently Contradictory Personal Characteristics

President Wilson, at Columbus, Ohio, combines a straw hat and an overcoat.

PART VI

ONE of the strangest phenomena in contemporary American history is the fact that, although Woodrow Wilson was President of the United States for eight years under the white light of criticism and analysis, his real personality is still a mystery to the country. People speculate as to what manner of man he was, in speech, address, conversation, mannerism, habits, and so forth. Roosevelt is an open book; Wilson unknown. What did he say and do? How did he speak to friends in personal contacts? Was he really austere, reserved, forbidding and cold or was he warm-hearted, friendly, outspoken and cordial?

Woodrow Wilson was Scottish—awfully Scottish. His forebears were from Ulster, in Northern Ireland, where the transplanted Scottish people retain many of their racial characteristics. The Irish strain was associational. From the light-hearted rollicking personality of the Irish, who had rubbed shoulders with his ancestors for a century, Woodrow Wilson got his Celtic characteristics. It was this to which he referred when he once whimsically remarked: "I am glad that I have something in me which, at times, relieves my Scottish conscience and gives me moments of delightful irresponsibility."

Like all people he had two distinct personalities, only he was fully aware of both. He was, in fact, almost two different persons. One was serious, reserved, almost cold. The other was free and easy, fun-loving, frankly cordial, warm-hearted. One made him a recluse. The other made him gregarious, happy to a point of hilarity in a crowd, thirsting for companionship.

This double personality explains the mystery about Woodrow Wilson. All the time that he was President the man in the street heard contradictory reports concerning him. One day he would hear of a funny story of a warm-hearted, impulsive action. The next day he would hear that Mr. Wilson had appeared very serious and solemn on some occasion. He could not reconcile these attitudes. He was accustomed to having his President reveal one definite character and always remain in it. Therefore, Wilson became a mystery. The average man did not know that he had two Presidents—one with a Scottish and the other with an Irish flavor.

The combination was delightful in its results. A business conference with President Wilson was an intellectual joy. He never "hung crape" on his confidential, official discussions. Serious, because they were on serious subjects, in the hands of a careful Scotsman, he nevertheless sprinkled them with anecdote, reminiscence, and apt story, to the great delight of his associates.

A perfect illustration of this attitude was his remark at Seagirt, New Jersey, two days after he was nominated for President, when letters and telegrams had piled up on him by the thousands. At a conference with two or three others who had offered to organize an office force, he was asked, as a preliminary, how he was getting along with the great pile of communications on his desk.

"Well," he replied, with a twinkle in his eye, "I'm like the Irishman who was eating soup with a fork, I'm gaining on it."

When Mr. Wilson was president of Princeton University he was interviewed by a representative of a Chicago newspaper who had come from that city to Princeton to get Mr. Wilson's views on the subject of cutting down the time of a college course from four to three years. This was a very serious question in the university world and was being actively agitated. Pointing to a group of juniors who looked somewhat verdant, meas- (Continued on page 31)

A more serious aspect of President Wilson. He is seen discussing the high cost of living with Governor Sproul, of Pennsylvania.

# One Reason Why Your Purse Is Light

## The Public Must Pay Because Government Is Not Self-Supporting

By ALLAN L BENSON

ILLUSTRATED By R. F. HEINRICH

Government should live on its own resources and not plunder.

STATESMEN are always at their worst in matters of taxation. What a stupid thing to tax windows and thus drive the people to do without them, as was long ago done in France. How cruel to lay a tax upon salt, the active ingredient behind the heart's ability to beat. Windows and salt were taxed because they were believed to constitute quick, sure routes to people's pockets, though the politicians were in error about the windows because people did without them and took the tubercular route to the grave.

But easy, quick, sure money is what the gentlemen who govern are always after, while taking care to avoid methods so transparent and so harsh that they may lead to revolution. A tax that can be easily collected and yields a large sum is the ideal tax. Next to it is the tax that yields a large sum and is paid indirectly. The indirect tax is the great intellectual product of statesmanship. To get the money without the victim realizing who got it is the art of tax-craft. A few are taxed directly. The great multitude are taxed indirectly, don't know it, and are difficult to interest in taxation. They are interested in spending money, but uninterested in one of the reasons why they have no more money to spend. But that is all a matter of education and understanding; and the world is young.

As an example of the tax that yields a large return upon the effort expended to collect it, nothing can compare with the inheritance tax. The best that can be said about this tax is that nobody has ever complained about it after he has paid it—because nobody pays it until he is dead.

James R. Brown, a New York economist, says that inheritance taxes are "but an admission that it is easier to rob the dead than the living." Nobody can successfully defend the tax upon any other ground than that the Government believes it needs the money and takes this way of getting it.

One rule should be applied both to great and small fortunes. If by reason of the way the fortune is used it is a public menace the Government should proceed against it at the earliest possible moment, which means proceeding against the owner while he is still alive. He and his fortune should be compelled to cease to be menaces. If a small body of working capital, used to a good purpose, is taxed out of existence, correspondingly small harm is done to the public, while it would be a public calamity to have the Government drive a large body of working capital, used to serve the public, into hostile or incompetent hands.

### *Income Is But the Evidence of Success*

A special committee of the National Economic League recently considered the inheritance tax and voted against it 15 to 5. The same committee voted against the income tax, 10 to 9.

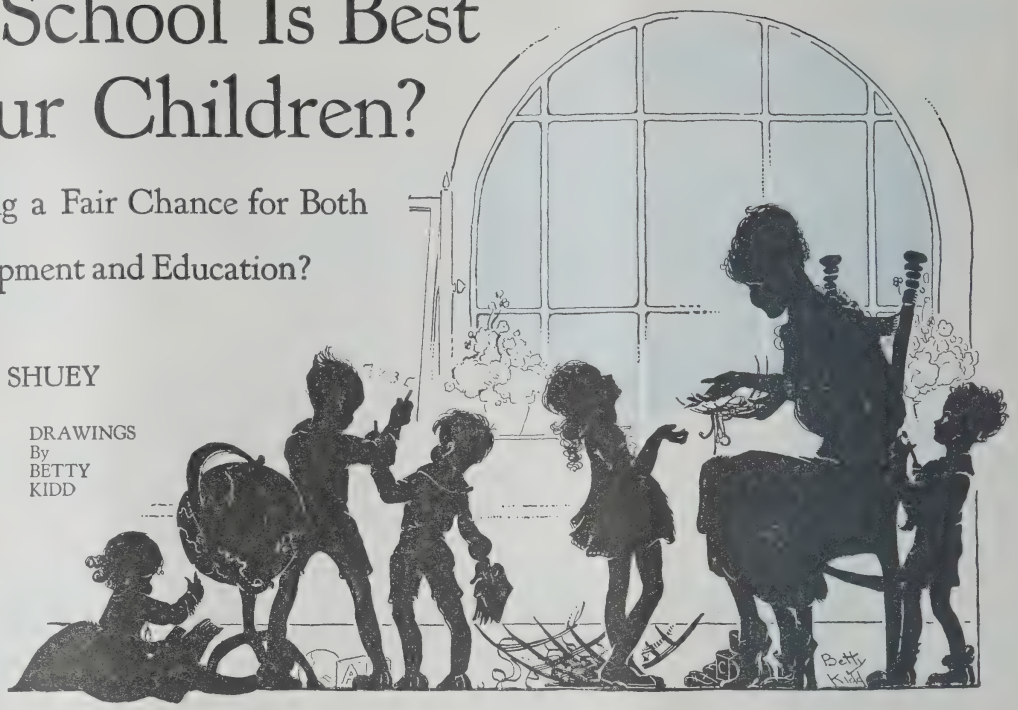
Some of these gentlemen, in the discussion of the general subject of taxation, made some very interesting points. Lewis J. Johnson, professor of civil engineering at Harvard, made several. Here is one that is worthy of consideration:

> Income of any kind is but the evidence of success in the *use* of an opportunity. And it is *having* the opportunity—and to the extent that the public contributes to its value and no more—which should be the pretext for taxing a man, not that he has turned the opportunity successfully to use. I consider taxation, on the ground of *success* in doing what keeps civilization going, a basic and needless and hence intolerable evil.

A little reflection will reveal the truth of these statements. An unskilled worker's wage is due to the use of his opportunity to work. So is the income of the most highly skilled worker and of everybody between these two. Each individual, however, is indebted to everybody else for the opportunity to work; indebted because we are all one another's customers; indebted because we are all indebted to one another for the peace and order without which we could not work and for what education has done and is doing to raise the level of the whole community. Each of us is indebted to government for what all of us, through government, do for ourselves and one another. The Government has a right to charge for services rendered, but it has no right to collect from a man merely because he has an income or because he is dead. Or to put it as Louis J. Post did: "Government should live upon its own earnings and not upon plunder."

A single short sentence used by E. W. Doty, of Cleveland, starts a long train of thought. Mr. Doty said:

"Property doesn't pay taxes nor does it have an income."



In view of the fact that property is everywhere taxed and the taxes are paid, this seems to be nonsense. Yet it is true. Taxes are paid from the labor of human beings. Property produces nothing, neither the largest industrial enterprise nor the smallest farm. *Wealth is produced only when somebody goes to work.* Moreover, if his work is to produce anything of value, it must be planned with more or less skill, either by himself or by others. In large enterprises, this means business management of a high order; in smaller enterprises, management perhaps of a different

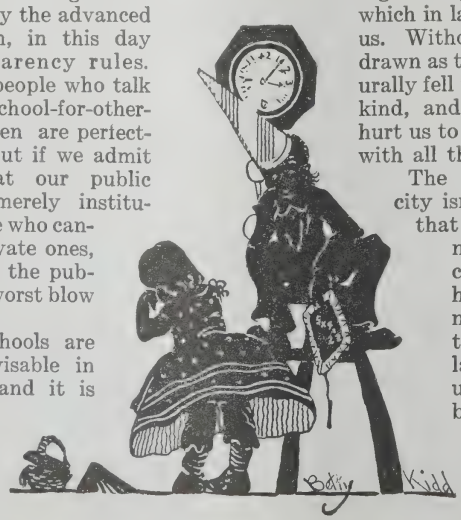
# Which School Is Best For Your Children?

## Are They Getting a Fair Chance for Both Character Development and Education?

By
MARY WILLIS SHUEY



DRAWINGS
By
BETTY
KIDD

"BUT you must admit, my dear, that few of our representative families now send their children to the public schools."

This is an inflammatory remark, to a mother who has a child in the second grade, another in kindergarten, and a third who will enter three years later, all in a public school.

But in certain radical cliques the public school is regarded as a "bourgeois ideology." A most impressive term, and the users (being mostly evolved public school products themselves) probably know what it means. They talk as if the public school were an institution on about the same plane as a charity hospital. Worthy, of course, but not a place we would think of sending *our* children.

In some communities the school question seems to be regarded solely as a matter of income, and as soon as a family reaches the given amount they announce it by automatically entering their children in private schools. This is partly because the fad just now is not to believe in anything established—except perhaps one *may* believe in Mr. Mencken. All things solid are regarded by the advanced with suspicion, in this day when transparency rules. Many of the people who talk of the public-school-for-other-people's-children are perfectly harmless, but if we admit the idea that our public schools are merely institutions for those who cannot afford private ones, we have dealt the public school the worst blow possible.

Private schools are decidedly advisable in many cases, and it is fortunate, considering the crowded condition of most public schools, that a number of people prefer them for their children. There is a place for the private school and the public school both, but there is *not* a place for the idea that the public school is not suitable for *our* children, or that public schools are filled with "objectionable" children.

Perhaps this is a small-town viewpoint—and provincialism is now the one unforgivable sin. In our childhood we took the public school as a matter of course, and we never knew that there were "objectionable" children there. We knew that there were children who did not have the advantages that we had, children of unfortunate parentage, under-privileged children, and we came to know that there were children who were not our mental equals, and children we did not care to invite to our parties. Unconsciously we were drawn together by those same instincts which in later life were to guide us. Without a single visible line drawn as to playmates, we naturally fell into groups of our own kind, and certainly it did not hurt us to be on friendly terms with all the children in school.

The agnostics say that a city isn't a small town, and that a city school is much more doubtful. But a city, to those of us who have children, hastily narrows itself to a small town attached to a larger one. Babies make us move to a "neighborhood" where we have our own homes, yards, markets, churches, clubs, movies and schools. Long before our children reach school age we have become a definite part of a community. That is what having children does even to extreme individualists.

We join the Ancient Order of Associated Fathers and Mothers, the oldest and closest lodge on earth, and the password that we learn is a belief in, and sympathy for, all childhood. We are interested to learn that the vegetable man has a son in high school, and we talk schools and children with the barber. By the time we have two or three children, and have tried adjusting their problems and dispositions, we know that nothing else in the world matters as much as that children have a fair chance, not only *our* children, but *all* children.

That is what the public school is offering—an equal opportunity for all. But the public school, like any going concern, depends on the people who are backing it, and when too large a part of our educated parents adopt that notion of the "bourgeois ideology" the public school will feel the effects.

Of course the choice of school depends on what we want for our children. If the three R's are still the standard in a public school the child probably learns long division later, and most of the six unprintable Anglo-Saxon monosyllables sooner, than in a private school.

We can't deny that there is more rough-and-ready contact, more torn suits and lost buttons, on a public school ground than on a small private school ground. But if the three H's of Head, Hand and Heart are considered part of education, if independence, ability to adapt to the group, and a democratic sympathy

(Concluded on page 24)

# MR. FORD'S PAGE

IT IS perfectly true that men cannot be legislated into righteousness. All the laws that were ever passed could not change human nature. It seems necessary to say this, because so many persons are now engaged in repeating it as a new thing, and are challenging the rest of the world to agree or disprove it.

When this is admitted, what remains? The fact of the law. Men cannot be made moral by legislation; yet there is the law; how is it to be accounted for? Who makes the law? From what source is law? What is its purpose?

If a man says of certain laws that "man cannot be made moral by legislation," what does he indicate? First, that there is a law whose requirements are higher than is convenient for lower moral planes. Second, that the law must therefore have proceeded from higher moral planes. Third, that there must have been something more than the moral issue to have moved the higher to put the law on the lower. Fourth, that the lower plane, in whose behalf the futility of law is being urged, must have been greatly in the minority not to have been able to prevent the law being made in the first place.

So that law is presumably the act of the majority moved thereto by what the majority deemed to be a condition of necessity. It is simply nonsense to say that there has arisen among our people a desire to regulate the morality of others. If that were so, there have always been plenty of opportunities for the exercise of that unlovely proclivity. We are perhaps the most easy-going people in the world, but we have our standards, we have our degree of taste and propriety, and we have strong and accurate ideas of social rights. When we as a people are moved to pass a law which interferes in any way with the activities of our fellow-citizens, there is something more behind it than a desire to interfere. How can that be styled interference with another by which a man also binds himself? The law applies to all.

When prohibition came in, it was through the vote of the people who used liquor; there were not enough total abstainers in the United States to pass such a law. They were moved to act to amend conditions which had appealed to them, as drinkers, as crying for control. Anyone who says that the prohibition law was invented by total abstainers for the oppression of those who enjoyed a drink, does not know the first facts of the matter. Prohibition was a condition voluntarily assumed by the majority of drinking men for the sake of the minority; it was the majority's action in behalf of the minority's need. That is why every trial of the law before the bar of public opinion becomes so great a surprise to the "wets"; they cannot understand why, when there are more "wets" than "drys," the country still keeps dry. It is the moral sense of the majority that keeps it so. Every time you put up that question to the conscience of the American people you get the response of their conscience, and in conscience they cannot support with Government consent a practice that has proved ruinous to the weak.

*PROHIBITION became the law of America through the vote of the people who used liquor. There were not enough total abstainers to pass such a law; it was a condition voluntarily assumed by the majority of drinking men for the benefit of the minority. The saloons were more responsible for prohibition than any other agency. They were trapdoors along the way of life for young people. It is the nature of Americans to make life as happy for the young as possible, to open up promising ways of usefulness for them, to place opportunities in their path, not pitfalls. Abolition of the saloon through prohibition was a natural development.*

It is not the moral aspect of the question, so much as the human and economic aspects that appeal to the average American. It is the nature of our people to make the way of life as happy for the young as possible, to open up the promising ways of usefulness, to make it natural for a young man or woman to attain his or her best opportunity. Our people increasingly found that the saloons were trapdoors along the young people's way of life.

Our people are also persuaded that prevention is the proper course to follow in dealing with questions of harm. We had a sodden population in certain quarters of every city where poverty and abuses abode, where little children were deprived of care and distraught women found all their power as nothing against the corner saloon that was stealing away their homes. This was a situation that found its way back to the general public by many avenues, through churches, poor commissions, courts and hospitals, until the general public searched out the preventable cause, and prevented it. Prohibition is a part of the American program of *disease and poverty prevention*. And it works.

The so-called abuses of prohibition are negligible in comparison with the conditions in the old saloon days. Many misinformed persons, both "dry" and "wet," talk of the inroads which the bootleggers have made among high school children and college youth. Nothing whatever to compare with the drinking done by the same classes prior to 1917. And wherever the "smart" element existed, and their disregard of the law was admired, a great change has come. Even youngsters come to their senses, if they are American youngsters. The stories told of youth and liquor today are 99 per cent false and out-of-date.

## The Omniscient Dr. Crane

NO MAN can talk or write incessantly without sometime slipping up. Dr. Frank Crane, America's greatest Apostle of the Obvious, is no exception to this rule. On a recent day his professional optimism must have been suffering from the daily strain that is put upon it, for he let loose a little preachment against Luther Burbank Thomas A. Edison and THE DEARBORN INDEPENDENT, taking for his text, "Shoemaker, stick to your last." It was a very poor sermon he preached because it was negative, but it left no doubt that Dr. Frank Crane (after the manner of pulpiteers half a century ago) regards Dr. Frank Crane as the equal of any of the famous gentlemen he named. But there they were supposed to sit, meekly, under the Doctor's pastoral castigation. Luther Burbank was scolded for having a theology. Thomas A. Edison for having said something about his soul. And THE DEARBORN INDEPENDENT for having discussed the Jews. And the text was repeated: Let the shoemaker stick to his last.

Still, Mr. Edison is probably as reliable an authority upon the soul as Dr. Crane, or anyone else. It is assumed that if Dr. Frank Crane has a soul, so has Mr. Edison. Doubtless men are created equal in that respect. And if Mr. Edison cares to discuss his soul or its future, it is no more than Dr. Crane and millions of others have done with no more, perhaps with much less, competency. And as for Mr. Burbank, he had the right of every man to make his own theology. Theology is the arrangement of ideas about the Ultimate Energy, its Nature and Purpose. Even Dr. Frank Crane has a theology, though probably a tenuous one. Every man who thinks has a theology, and no two theologies are alike; everyone does his own tinkering with them, shades them according to his personality. It may be admitted, however, that in knowledge of the soul and in finality of theology, no living man can pose as an authority.

But THE DEARBORN INDEPENDENT boldly challenges Dr. Crane to defend his reference to the Jewish Studies in this paper. Here is a case where the "shoemaker" did stick to his last. This paper *studied* the Jewish Question. This paper *can* set up as full-fledged cobbler in that respect. *And Dr. Frank Crane cannot.* He has never studied the Jewish Question—he would not dare write his findings if he had. Until he has studied that Question he cannot—according to his own doctrine—discuss it. Not being as qualified as THE DEARBORN INDEPENDENT, he cannot discuss this paper's work on that subject.

So we turn the text on the preacher: "Stick to your subject, Dr. Crane—if you want to attack the cobbler, study shoemaking."

## A Latin League?

WHAT happened at Geneva is gradually becoming known. The first fact established was that Sir Austen Chamberlain, hero of Locarno, had privately agreed with France that Germany's entrance into the League should be offset by giving Poland the status of a great power. This was a concession to the suspicion of France that the League was being packed against her. It was outspoken acknowledgment of what everyone really knows, that the League is, and is intended to be, not a democracy of nations, but a group of the stronger dominating the weaker in association.

Gilbert Murray, a great friend of the League, put this very clearly: "When the Covenant was drawn up the Great Powers were understood to be Britain, France, Italy, Japan, United States of America, Germany and Russia. To take suddenly a number of other States—not outstandingly strong or stable or progressive or populous or otherwise different from their neighbors—and erect them into permanent, irremovable, irresponsible guides and leaders of the world because, forsooth, they happen at the moment to be agreeable to France or Great Britain or Italy, is a proposal whose lack of elementary common sense I find it hard to characterize."

The Council of the League is therefore accepted as a group of the Great Powers, the Assembly as a group of the lesser nations. For the sake of the completion of the higher group, Chamberlain was willing to admit a member of the lower. It was an error of the first magnitude though not necessarily vicious.

But another element is looming out of the trouble. It is vaguely referred to as the Latin League. Those who are studying its appearance regard it not so much as an attempt to gain a balance of political as of racial power. The disturbing element at Geneva was not Germany nor France; the bomb came from a direction least expected—from Brazil. The speech of Señor Mello Franco's was so reminiscent of other recent utterances that he was nicknamed Mellolini, to indicate that he strongly reminded the League members of Mussolini. The feeling—which may be some-

what more than a feeling—is that the known combination of France, Spain and Brazil in the recent breakdown may have received its inspiration from Italy, Mussolini's contempt for the League being well known. Put Italy, France, Spain and Brazil together in a bloc, and they constitute a Latin League. It was an entirely new and unexpected development, but not difficult to understand. From artificial divisions and alliances, the world seems slowly finding its way to the real ones.

## *A Promise*

IT IS SPRING. Buds are bursting into leaves. Birds are singing. The road winds like a ribbon up hill and down dale. Soon the country air will be fragrant with the breath of apple blossoms. A tractor drawing gang plows is turning the rich, brown earth. Nature, suppressed all winter, is bursting her bonds. The very air is vitalizing. The family motors along country roads to catch the first balmy breath, the first vernal view. They return in the cool of the evening, flushed with health and vigor. The ability to get about, to feel the touch of nature, has increased the healthfulness and sanity of the American people. Soon will come the long, hot days of summer, but a generation of outdoor lovers will welcome it. The old porch swing and palm-leaf fan are *passe*. The pleasure of riding through tree-fringed country roads has wrought this change.

## *The President*

PRESIDENT COOLIDGE'S speeches to the Pan-American journalists were largely what the boys call "applesauce," and not fresh at that, until he came to his own subject. He made it clear beyond a doubt that the United States had rejected the League because it has no business in the internal politics of other nations. He also said that we had gone into the World Court because, while we were not interested in international politics, we were deeply interested in international justice.

Then he went on to say that "this has been done under reservations which adequately safeguard American rights and *tend to strengthen the independence of the court.*" The reservations were intended to safeguard American interests all right, because they make the United States less than a member, and the Court less than a Court. But the reference to the "independence of the Court" is not so clear. And the expression "tend to strengthen" that independence is less clear. Wherein is the Court not independent? Of course, we, with our reservations, are independent of the Court, but of whom or of what is the Court not independent?

The President cannot mean that the Court is independent of the League of Nations and that our refusal to obey the Court, as a Court, will "tend to strengthen the independence of the Court." He cannot mean that. Does he mean that such measure of independence as the Court enjoys is being threatened, and that our distant, tenuous adherence will tend to strengthen its hold on such independence as it has? If so, who is threatening the Court's independence? And is this one of the arguments which led the Senate to vote an unpolled, unconvinced nation into official adherence?

The President was clearly mistaken in referring to race and country as "artificial" differences. If night and day be not real but artificial, if the continental divisions of the world be not real but artificial, if the difference between the tribes of Africa and the Anglo-Saxon be not real but artificial, then the President speaks truth. But such differences are written deep in the deepest natural we know, which is Nature. It may be a pleasant thing to say at a banquet, but no man taking thought would repeat it seriously that these deepest of natural divisions are artificial. What the wise man does when confronted by the fact of race is not to deny it but interpret it.

## *What Is the News?*

WHAT'S the news? The paper is full of print, and the headlines call alluringly. Beneath each item on the local page is deep personal significance—of gladness, shame or anxiety. Who can know the ceaseless life of the city; the continuous change of psychic states which make up the life of the multitude —who is fit to know it? And because no one is fit we have the endless patter of events, the accidents and crimes of life, the view which hospital record and police register give.

Then what *is* the news? What's happened? Nothing has happened save what is happening, and what is happening no one sees; the great happenings are without observation. By the time it breaks in events, it is all over—like a blown blossom.

The news is that tendencies are developing which in time shall become driving forces, that minorities are forming which in time shall rule the world, that thoughts are a-borning which in a few years shall be the commonplace of the streets, that old stabilities are coming back because the people have discovered the deception of instabilities, that things are out of control of the captains and mighty men but Nature still functions and will fulfill her end. That is the news. In the personal life everything that ever was new becomes new once more, and is often several times renewed in the course of a single life's experience. In the social life more things are new, but the seed of society and the sap of society are very old, and determine the nature of the tree.

There is great news, but it is not printed.

# The Independence Bible of America

## The Founders of the Republic Wanted Their Own Translation

By A. G. WALKER

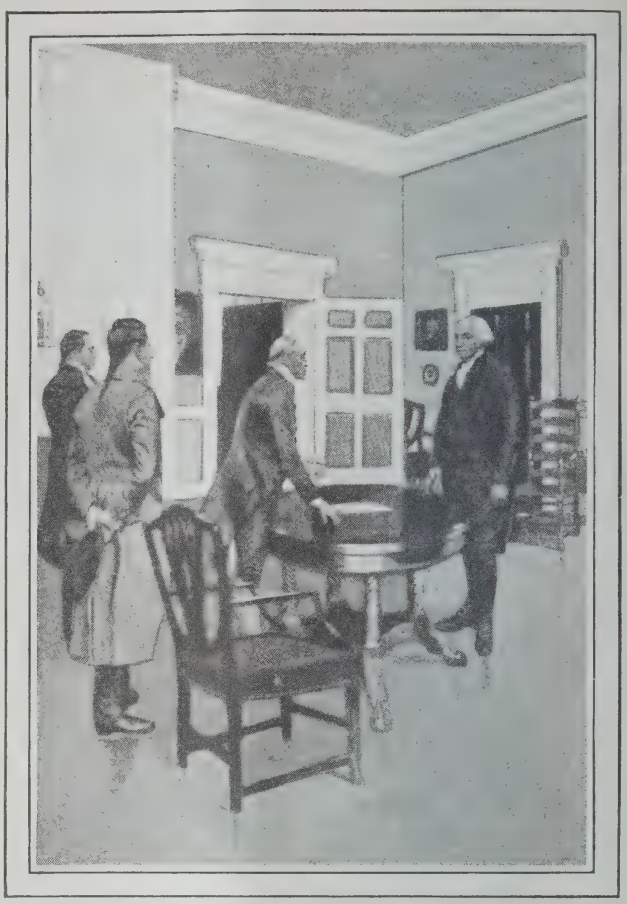
"INDEPENDENCE BIBLE? That is a new one on me." In talking with a literary friend I had casually dropped this phrase and he at once interrupted with the remark, half a question, half skeptical. Independence Hall and Liberty Bell were names as familiar as his own. Also he had heard of the *Wyclif Bible* and the *Breeches Bible* and the *Treacle Bible* and the *Coverdale Bible;* and the *King James* and the *American Standard Bibles.* But he had not heard of *Independence Bible.* But I could not lay that up as a reproach against him for it was only a comparatively recent attainment of my own.

On a certain day, tired of the routine of reading the calligraphy of Civil War soldiers and Civil War newspaper editors, including one undecipherable Horace Greeley, I followed my instinct and came upon shelves and drawers of dusty, faded, ancient books. It was in this way that I stumbled upon *Independence Bible.* This I may tell you at once is not the name printed on the work itself, it is a name I have given it. The story will reveal my reasons for taking this liberty with a dead man's work, and the reader can then agree or disagree with me as he sees fit.

I found two volumes belonging to a four octavo edition of the Bible. The other two volumes I could not find and the librarian could give me no help. I am still in search of them. The title-page of the first volume read,

"The Holy Bible
containing the Old and New Covenant
commonly called the Old
and New Testament
translated from the Greek.
By Charles Thomson,
late secretary of the Congress of the
United States, Philadelphia.

Printed by Jane Aitken, No 71, North Third St, 1808, 4 vol." Probably I ought to have known all about this as every well-instructed American ought to know such an important fact but I didn't and although historic information is accessible I have not found in my region of the United States anybody less ignorant than myself on this point. Even some Philadelphians, and this we know amounts almost to a miracle, have admitted their ignorance without the least suggestion of a blush.



Ask one man in a million and he cannot tell you the name of the secretary of the Continental Congress. He supposes they had a secretary if they had a Continental Congress.

Well, Charles Thomson was secretary of the Continental Congress throughout its existence. His scholarship and patriotism, ardent and unwaning from first to last, were on the side of Independence. In a letter of 1765 to Franklin then in London, he wrote, "Be assured the Americans will light lamps of a different sort from those you contemplate." Franklin had suggested that though the Stamp Act had brought night upon them they might light candles and make "as good a night of it as we can."

It was Thomson who took the Declaration of Independence after it had been signed, and stood boldly forth on the steps of the State House and read it to the world. According to contemporary accounts just a handful of the ordinary citizens stood around.

It was Thomson who carried the word to Washington at Mount Vernon that he had been elected President. He was commissioned to bring the President-elect back for the inauguration.

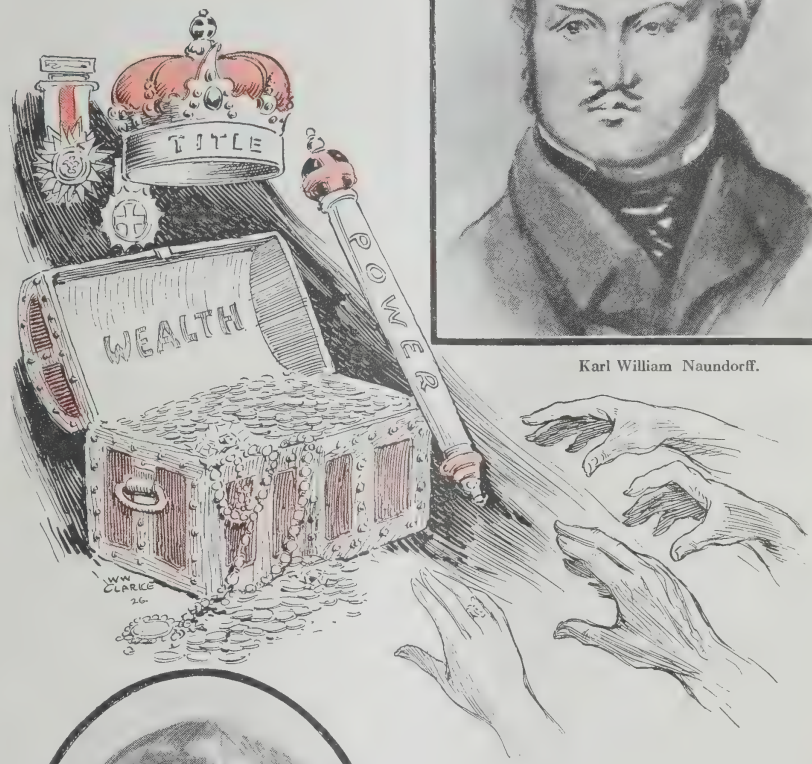
Thomson regarded the Bible as at once the supreme charter and regulator of human liberty. No man was better able to appreciate the full worth of the *King James* version than he, but he had had more than enough of kings. Even his Bible, he felt, should be independent. To him at any rate remains the outstanding honor that he made the first translation of the whole Bible from the Greek made on this continent and gave it to the young nation in 1808. He had translated the *Old Testament* from the Septuagint into the English language. This was the first translation of the Septuagint into English. He had translated the *New Testament* from the Greek and in addition had made a scholarly synopsis of the Gospels. The work took him 25 years.

Thomson, clerk of Congress, announcing to Washington, at Mount Vernon, his election to the Presidency.
From Woodrow Wilson's *History of the American People,* published by Harper and Brothers.

Thomson's translation was entirely independent. Five times and more with his own hand he traced out word by word from *Genesis* to *Revelation.* Living quietly at Harriton he divided his energies between this work and the improvement of his six-hundred-acre farm. An English authority wrote of it in 1824, "This trans-Atlantic work is creditable to America and to the learned author. It is the only English version of the Septuagint and is therefore worthy of attention, as well as for the fidelity with which it is executed. The *New Testament* contains many improved renderings and improvements."

Money was scarce in those days for buying a four-volume edition of the Bible, and it was commercially a failure. It was stored in Ebenezer Hazard's garret for years and after his death sold to Dr. Earles at the corner of Fourth and Chestnut streets. The MSS. have been preserved in the library of Allegheny College and of the Historical Society of Pennsylvania.

It is a fact worth recording, I think, and worth reminding ourselves of at times, that the first Bible translator in America was also secretary of the Continental Congress, Proclaimer of the Declaration and notifier and escort of the first President-elect.



# Pretenders Who Got Away With It

## *And Some Others Not So Fortunate*

*By*
F. L. BLACK

Karl William Naundorff.

WOULD you rather believe a lie than the truth? There are thousands who would—particularly if the lie is veneered with plausibility, romance and mystery. "Truth," James Russell Lowell once remarked, "is said to lie at the bottom of a well for the very reason, perhaps, that whoever looks down in search of her sees his own image at the bottom, and is persuaded not only that he has seen the goddess, but that she is far better-looking than he had imagined."

If the searcher be half-blinded by rash credulity, perverted logic, and distorted evidence, as many are, how can he be expected to see straight mentally and make a valid interpretation of facts? There are those who have a sentimental preference for fiction over fact and who are prone to a belief in possibilities rather than probabilities. Suggest to them a possibility which intrigues the imagination and they accept and propagate it as gospel, and proved fact. It is true, unfortunately, that many who lack criticism and caution and follow faith blindly and without reason also unconsciously twist facts to their prejudices and partisanships. It is people of this class who have followed and supported the myth makers, the charlatans and pretenders throughout the ages. Depend on this, dear reader: Tell the most preposterous tale and you will always find some who will believe. Repeat it often and your following will grow.

Eleazer Williams.

Since the days of Nero, whose widely doubted suicide gave rise to many impostors throughout the Roman Empire, any secrecy or mystery surrounding the imprisonment, assassination or disappearance of the famous and infamous has stirred the world's imagination and caused many to dispute the alleged official reports. Each of these many impostors had a following made up of persons with great faith but little reason.

There is the story of Perkin Warbeck who, at the time Columbus discovered America, was being entertained all over Europe as Richard, Duke of York, the younger of the two sons of Edward IV, both of whom history says were murdered in the Tower of London. Through the assistance of the Scottish King, James IV, a noble marriage was arranged, and England was for six years much upset by this pretender to its throne. Warbeck, before his death, confessed that he was but the son of a poor Flemish burgher. Those who had investigated the genesis of this pretender before his confession and were in possession of the facts were not believed by his followers, many of whom were wilfully blinded by their prejudice against the then reigning English king.

Two centuries later we have the mystery of the Man in the Iron Mask, whose story supplied material to several great novelists. For many a year visitors to the old prison on the Isle of Sainte Marguerite have been shown the masked man's cell and regaled with

tales of his luxurious and mysterious life, which ended in 1694.

It is said that, imprisoned by Louis XIV, this strange personage was compelled to live in prison hidden from recognition by a mask with steel springs, but was treated with great deference and indulged with the daintiest food and finest raiment. Who was he? According to the most striking and widely disseminated of the many legends and the one supported by Voltaire, the masked prisoner was an older brother of Louis, but of doubtful legitimacy.

Some believed that he was the son of Oliver Cromwell, and one writer went to the ridiculous extent of claiming that a son born of the masked man of mystery and the jailer's daughter was spirited off to Corsica and became the ancestor of the great Napoleon. The most likely and best authenticated story is that he was not a royal personage at all, but Count Mattioli, the minister of an Italian prince, and a dangerous character by reason of his intrigues.

Another century passes, and we have the mystery before which those of the past pale into insignificance—that of the Lost Dauphin, and the forty claimants, thirty-nine of whom, of necessity, most have been liars. These without exception have brought forth most amazing legends, myths, and traditions of the continued existence of persons supposed to be dead.

After Louis XVI and Marie Antoinette paid the penalty imposed by the Revolution, their son Louis, a boy ten years of age, was alleged to have died January 5, 1795, in the Temple and to have been buried in the cemetery of Ste. Marguerite. Rumor soon ran through the world of fashion that the grave in Ste. Marguerite held the body of an unknown child, who three days before his death was substituted for the prince by Royalist plotters with the connivance of the guards. It was claimed that the Revolutionists learned of the substitution and watched all roads leading out of France for Louis, but in vain. The next forty years averaged a prince a year and France was often in a quandary about the claims of her numerous would-be rulers. Among the forty was Jean Marie Hervagoult, son of a tailor, whom many persisted in believing to be the Lost Dauphin even after he confessed his real identity. He died in 1815 and a new pretender appeared in the person of Mathurin Bruneau, a shoemaker, who is said to have died in prison in 1822. It was eleven years later that there was imprisoned in Paris, Louis Hebert, alias Richemont, who had been claiming in the highways and byways of France that he was Louis XVII.

The United States and Germany, however, brought forth the two most pretentious pretenders to the French throne, in Eleazer Williams and Karl William Naundorff, the first an Episcopal missionary to the American Indians, the second a watchmaker of Spandau, Prussia, and the founder of a new religious faith. Romantic indeed is the story of the American claimant, who as a ten-year-old boy is said to have been left by two French Catholic priests with a half-breed Iroquois chief named Thomas Williams, and to have been brought up by him near Lake George, New York, with his other children, as Eleazer.

The boy's memory had been impaired by illness, and when left with the Williamses he was in a condition of half imbecility and his recollections of the past were spasmodic and confused. His half-Indian brothers were amazed and sometimes frightened by what they considered a demented imagination—daydreams of gilded halls and princely courts. Funds for Eleazer's education were furnished by parties unknown, and without doubt he was the scion of some French family, hidden away in the American wilderness for reasons known only to those who brought him to our shores. No effort was ever made by Williams himself to gain recognition as the Dauphin, and as far as can be learned, his life was above reproach.

This cannot be said of the Prussian pretender, Karl William Naundorff, who managed to keep his name before Europe for many years and even went so far, it is stated, as to wound himself to gain sympathy in an effort to prove an attempted assassination.

He told, as did many of the forty, most likely stories of his escape from France as the Dauphin, and possibly gained a greater number of partisans than any of the others. Many of these still believed in him after stories were published showing that he was a swindler and counterfeiter. He was eventually expelled from France and died in Holland in 1845.

As recently as March 26, of this year, a blind representative of the Naundorff family, "Louis, Prince de Bourbon," according to the New York *Herald Tribune* Paris Bureau, entered suit in the French courts against the publishers of an encyclopedia which referred to his pretensions as the grandson of the Dauphin as "intriguery." The report states that the blind prince's personal appearance is strangely like that of the Bourbons of the 18th Century.

Articles and books galore have been written by devotees of both Williams and Naundorff supporting their claims, and strangely enough they carry conviction. However, only one can be true, if either is. Even today there is a pretender, a lieutenant in the French colonial army, who is recognized by the Royalists of France as the grandson of Louis XVII, the Lost Dauphin who, it is claimed, escaped to England and there ended his days.

Russia of a century ago has supplied a delightful example of the human penchant for making legend on the slightest pretext. Alexander I, grandson of Catharine the Great, so the story goes, took a passive part in the assassination of Czar Paul, his mad father, and in expiation decided many years later to become dead to the world and spend the remainder of his life as a monk. Suddenly, taking the Empress, his physician and a few personal servants, Alexander, late in the autumn of 1825, hastened to a small town in the Crimea. He had an-

## A Grant Robertson Gag

The present Prince of Wales and Christopher Morley were classmates at Oxford University, and according to Mr. Morley in *Pipefuls*, Grant Robertson, the well-known historian, while lecturing on English history, "got off one of his annual gags to the effect that, according to the principle of strict legitimacy, there were in Europe several hundred (we forget the figure) persons with a greater right to the British throne than the family at present occupying it. The roomful of students roared with genial mirth, and the unhappy prince blushed in a way that young girls used to in the good old days of three-piece bathing suits."

The late Czar of Russia and his family.

nounced that he needed rest and quiet.

Soon in St. Petersburg bulletins were received of the Emperor's illness, and then came one announcing his death. A body was returned to the palace and buried in great state in the last resting place of the Czars. Several years later it was learned that the Empress had purchased her mourning garments in Moscow on the way South while the Emperor was still in good health.

The second step in the legend was that the young Czar Nicholas I, Alexander's brother and heir, for a period of many years conducted a secret correspondence in a mysterious code with a strange and most devout monk in a small, far-away Siberian monastery. Legend has it that about 1840 Nicholas hastened to this distant man of God, who was ill, and for four hours was closeted alone with him, no one hearing a word that passed between them. A few days later the monk was gathered to his fathers and it is said that Nicholas was sorely grieved.

Just before the late war, research students working in the Russian Imperial Library claimed to have discovered that the handwriting of the secret letters, which had been preserved, corresponded with that of Alexander's state papers. The war halted these researches, and unless the Bolshevists have better preserved the records of the Imperial Library than the reports would indicate, the fate of Alexander, whom Napoleon claimed was the greatest diplomat of all Europe, will ever remain legendary.

In our own country but one legendary escape has grown to proportions comparable to Europe's many times told tales. The story of the alleged substitution in the Garrett barn of another for John Wilkes Booth, the assassin of Abraham Lincoln, has been already told in the columns of THE DEARBORN INDEPENDENT.

Wars have been the chief producers of the situations out of which have grown these legendary escapes and substitutions, and the Great War is no exception. What became of Lord Kitchener, the greatest British soldier of his time, and did the Czar of all the Russias and his family perish by the hands of their Bolshevik enemies?

Mentioning Lord Kitchener revives the story told of Sir Hector McDonald, who was with Kitchener in his Egyptian campaigns. Sir Hector, "Fighting Mac," as he was popularly called—one of the few private soldiers in the British Army to rise to the rank of general—was sent to command the troops in Ceylon. Considerable criticism arose as to his administration and grave charges were made against him in England. Hastening home he stopped in Paris and there committed suicide in March, 1903. Soon legend stepped into the scene with the claim that the suicide was a trick to keep Sir Hector from the necessity of facing his accusers and that the dead body of someone else was interred in his stead. The Russo-Japanese War was the theater for the next act. General Nogi was Sir Hector in person. Undoubtedly this apparently absurd story could easily have been disproved, but Japan was a long, long way off, and General Nogi was little known to the outside world until after his brilliant exploits in the reduction of Port Arthur and the capture of Mukden placed his name among the great war gods. In accordance with the traditions of old Japan, he committed hara-kiri on the death of the Japanese Emperor in 1912. He and Sir Hector had suicide in common, if not their identities.

In 1916, Lord Kitchener set sail on the cruiser *Hampshire* on a military mission to Russia. Official report says the boat while passing through the Orkney Islands, off the north of Scotland, was destroyed on June 5 by an unswept German mine and that nearly all on board were lost, among the number, Lord Kitchener. Legend says this is not true, that the boat went down but Kitchener was among the few saved. Stories were circulated that he landed on Russian soil in safety. It was believed that "K of K" bore a charmed life. On many occasions he had miraculously escaped death, twice at the hands of assassins and once in the front-line trenches in France. Many could not or would not credit his tragic death. The latest "revelation" is that Kitchener's body was washed up and buried by fishermen on one of the Scandinavian islands.

Field Marshal Earl Kitchener, of Khartum, G. C. B., O. M.

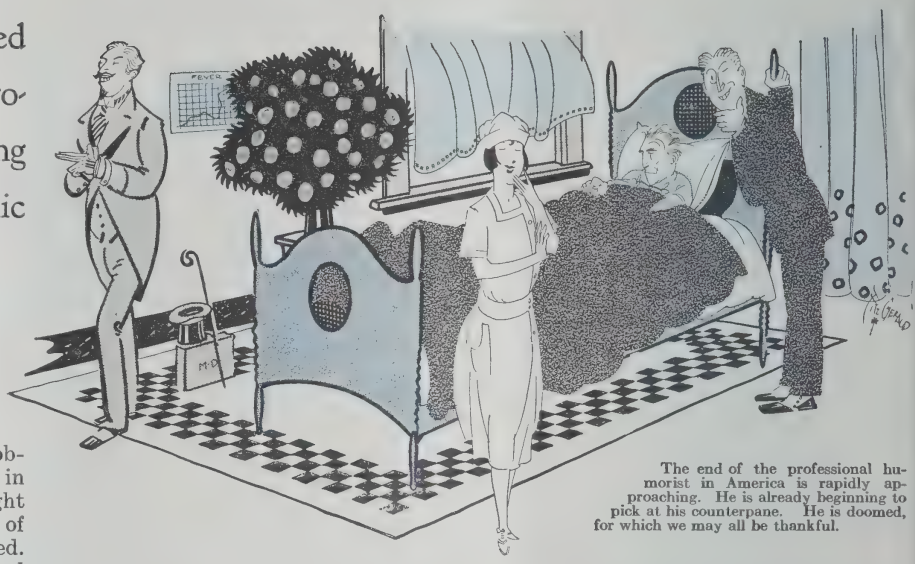
A few weeks ago the Soviet government, through the Leningrad *Krasnaya Gazetta*, acknowledged as authentic the story of the execution of the Czar, Nicholas II, the Czarina, the Czarevitch and the four Grand Duchesses, in July, 1918, in the Ipatieff house at Ekaterinburg. It is unlikely that this will destroy the numerous legends that the Russian royal family is still alive, for the majority of the Russian peasants believe that the "Little Father" survives and again will be their ruler.

There are those who are convinced that the Royal family is living incognito in a Siberian monastery or is hidden in the mountains of Japan. A combination of the Russian Czar and Lord Kitchener legends occurs in the fantastic story that Nicholas was rescued by Kitchener and is concealed in a Tibetan monastery awaiting an opportune time to return to Russia and again assume his throne.

Newspaper headlines informed us about three years ago that one of the Grand Duchesses had escaped and was on her way from Vladivostock to the United States. Thus far she has not materialized. Possibly she was turned back by the fate of her royal father who, Dame Rumor reported, had been compelled to work his way over as an oiler on an American freighter in 1920. And, according to a recent story in the New York *Times*, a young woman with deep-blue Slavic eyes, red-brown hair, and a bruised mouth that smiles only on one side, is dying in a private hospital in Berlin. She says she is the youngest daughter of the late Czar Nicholas, the Grand Duchess Anastasia.

These many legends surrounding the disappearance of princes, potentates, the great and near great, are not astonishing when it is realized that they are kept alive by faith, by people wanting to believe. They illustrate the irrepressible vitality of pleasing myths. A story with the element of mystery is always most intriguing, especially where it surrounds a royal personage.

Many claimants come forward because of the pecuniary and social advantages to be gained. There is then the other class of pretenders who are afflicted with a type of mania which causes them to confess crimes and identities not their own. Police departments are confronted almost daily with persons of this type.

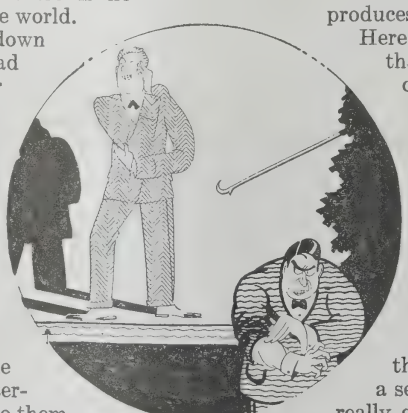


We have also those about whose birth there is some mystery, who gradually build up legends which they themselves believe. For instance, the case of a western girl who became convinced that she was a daughter of French nobility who had been left with a woodsman's family. About six years ago she persuaded the editor of an old and conservative magazine that her claims were valid, and he published an unusual diary which she professed to have written as a child. This diary contained French phrases and words that would not ordinarily come within the scope of learning of a woodsman's daughter. Her parents, however, contradicted her story and offered proof that she was their own daughter.

When dope fiends have taken an overdose of some narcotic and as a result are delirious, they are (*Concluded on page 18*)

# Laughing Himself Out of Court

## Like a Royal Jester Stripped of Cap and Bells, the Professional Humorist Is Losing His Hold on the Public



By THOMAS L. MASSON

The end of the professional humorist in America is rapidly approaching. He is already beginning to pick at his counterpane. He is doomed, for which we may all be thankful.

THE course of all professional humorists is set for the near waters of obscurity. In this country, in each generation, they have brought forth of their kind, so that the line of succession has been uninterrupted. But this was due to special racial and geographical conditions; and now the end of the professional humorist in America is rapidly approaching. He is already beginning to pick at his counterpane. No combination of trained nurses, hot water bags or systems of therapeutics can save him. He is doomed—for which we may all be thankful. Doubtless he will linger along for a time, and have his flickering moments of brightness, but the sepulcher beckons and will not be denied.

As far back as the memory of man harketh, the illusion has persisted that professional humor is popular. No one seems to have dared admit that he didn't like it. Yet there is no drearier reading in the world. I defy anyone to sit down and attempt to read through, word for word, a book of popular humor without lapsing into a state of coma. I have never seen anyone who has performed this impossible feat. If you wish to die a speedy and violent death, get a company of intelligent people together on a rainy afternoon and read aloud to them out of a book of jokes, short or long. At the first few pages they will chuckle or even scream with joy. At the second few pages their faces will begin to set. At the end of the first quarter stretch they will get out their knives and revolvers. This is where—if you wish to live—you will make a hasty exit.

A moment's reflection will convince anyone why all professional humorists are so deadly.

The United States is the only country where the professional humorist has had any official standing as a purveyor of literature. In other countries there have been, and are, joke-makers—painstaking wits who scribble paragraphs for the comic journals and write humorous jargon. The coffeehouse wags who grind out little essays or bits of character to be used as fillers in the columns of contemporary journals have always existed. But these gentry keep themselves under cover. Many British writers have written thus, but their identities have not been beaten into the public mind, as in America. Thackeray wrote for *Punch*. A. A. Milne, E. V. Knox, A. P. Herbert, and E. V. Lucas all write for the same periodical, but in each case this writing is incidental to a main career which produces plays or novels.

Here we are coming into that state now with certainty. Ring Lardner is better than Ring Lardner. The Sam Slicks, the Artemus Wards, the Bill Nyes, and a host of others like them, will no longer propagate their kind. Indeed, it is not impossible in the near future that we shall produce a set of writers who will really entertain us.

A moment's reflection must convince anyone why all professional humorists, as such, are so deadly. You cannot actually laugh at anything more than once. Now a professional humorist has only one song that he can sing. He has simply got to surprise you or he is lost. The first time his jack-in-the-box comes up you get the thrill that comes only once in the lifetime of that impersonator, so far as you are concerned. And so all professional humorists, after the first blow-out, spend all their anguished hours in attempting to ring the changes on their original theme. The professional humorist is a man with a secret formula. His main affair is to conceal it under outward changes. But our instincts run true to form, and we know that behind the masks he holds up, it is the same old formula.

In 1868, or thereabout, Charles Godfrey Leland invented Hans Breitman, a Pennsylvania Dutchman, and wrote ballads that were amusing enough. In 1883 Julian Ralph followed him (in prose) with his Little German Barber. After this came George V. Hobart (so recently deceased) with his Dinkenspeil, and now we have Milt Gross with his "Gross Exaggerations," using the modern Yiddish-English patois of the New York tenement house. All the same. Each in its turn has created its particular ripple.

As for dialect in all its forms, what would the professional humorist do without it? The formula is simplicity itself: you have but to turn the most stupid and commonplace observation on life into any kind of dialect, and the result is declared to be a masterpiece of humor. Most professionals who have employed this easy way to make people laugh—and almost all of them have—generally invent a kind of hybrid dialect of their own. Lowell's dialect, as Professor Krapp has pointed out in *The English Language in America*, might apply to any section of the country. So Artemus Ward, whose professionally humorous sketch entitled *High-Handed Outrage at Utica* President Lincoln read aloud to his Cabinet in order to divert them, begins as follows:

"In the Faul of 1856 I showed my show in Utiky, a trooly grate sitty in the State of New York." He then goes

on to write of the cage "containin my wax figgers of the Lord's Last Supper, and cease Judas Iscarrot by the feet and drag him out on the ground."

At the present moment, it requires a severe pull for the imagination to conceive how such stupid inanities as these, and more which I spare the reader, could possibly invoke any kind of laughter from one of the greatest men of all time. Yet we know that it is so. We know that Artemus Ward was applauded in England, that he became a contributor to *Punch*, that he was hailed as a great humorist. We must always remember that the surprise is what tells in popular humor. As soon as the surprise ceases, the humor ceases. For example, when Milt Gross began his sketches in the New York *World*, a friend of mine remarked that they were the funniest things he had seen for years. They were. I read them for about three weeks with great delight. But how the novelty does wear off!

The amazing part of all this is how the professional humorists have succeeded in keeping themselves going for so long. This, of course, is because the country is so big. I cannot think of reading one of George Ade's fables through to the end, as good as I know they once were. Yet they are still published, even though I personally fail to find them as humorous or as sparkling as of yore. It seems that even one's capacity to produce readable slang for the present moment appears to be limited to a certain section of a man's creative life—probably between twenty-five and thirty-five.

The life of any professional humorist has never been more than seven years.

It must be apparent, however, that typography is rapidly overcoming the bulk and diversities of readers. This is due to the syndicates. When a popular writer produces anything nowadays, within a week or at best three, his piece can be read by everybody everywhere. Heretofore, if one set of readers tired of a humorist, he had a number of other sets in reserve. If my recollection is correct, I read Peter Dunne's "Mr. Dooley" in a St. Louis paper way back in the eighties. Later he was taken up by Henry Ten Eyck White, of Chicago, whose "Lakeside Musings" in the *Tribune* were so amusing.

After Mr. Dunne had acquired his reputation, he was highly and deservedly praised by English critics, and his first book of Dooley's observations sold a hundred-thousand copies. Still later he syndicated his pieces and made as high as a thousand dollars a week. So far as their workmanship is concerned, they are now as good as ever. Recent attempts to revive them, however, have not been highly successful. We are becoming so knit together that almost everything—even more than everything—is known the next day.

A more recent example is that of Will Rogers, who achieved great fame as a raconteur in additon to his talents as a theatrical entertainer. He was able to get into his remarks the element of surprise, this being due quite largely, I should say, to the effect of being courageous enough to tell the truth.

There can be no question that, as a momentary comedian in type, Will Rogers was, and possibly is, funny. He was hailed by his press agents as a national humorist and his literary personality was played up. The New York *World*, ever on the lookout for something new, secured him for their front page, and, as this feature was syndicated all over the country, quite naturally Will Rogers was read everywhere once a week. One day, however, Milt Gross came along with his new bag of tricks. Novelty, always novelty. The result was that the astute editors put Milt Gross where Rogers had been, and relegated Rogers to a back seat, that is, to another section in a remote column. When Rogers discovered this slight, he wired in to stop his pieces in the *World*. Vanity, all is vanity!

The discerning reader will have undoubtedly perceived already that I am not attacking the race of professional humorists, or even decrying the quality of their humor. T. C. Haliburton, the creator of "Sam Slick," was an original genius. If I would rather sleep in a hair shirt than read his book now, it is nothing against his chronological importance.

Without a long line of these professionals—Max Adler, Josh Billings, Robert J. Burdette, George H. Derby (John Phoenix), Marietta Holley, Artemus Ward, Bill Nye, John Kendrick Bangs and others—it is highly probable that our present taste for what is really permanent and good—as deplorable as this may seem—would not have been developed even to its present state. The fact is that we are now rapidly entering a new phase of our literature, and owing to the causes I have indicated, and others, the professional humorist will cease to function. He may still retain whatever sense of humor may have been imparted to him by his Creator, but he will use it for broader purposes.

You may not be able to indict a whole people any more than when Burke lived, but, if you are a professional humorist, you can very soon tire them out. The life of any professional humorist has never been more than seven years. After that, he lives on his past reputation. There is naturally advertising value in a mere name. Then again, it must be remembered that we have been able to maintain a line of professional humorists in this country because of their additional ability to talk.

With certain exceptions, all of our professional humorists have been good talkers. J. M. Bailey, the Danbury *News* man, once told me an amusing story of how some notable man came to Danbury to lecture and Bailey, as the local celebrity, was deputed to introduce him. Bailey said that his neighbors had become so accustomed to his jokes that they no longer cared to read them, although they were copied widely in other papers, so they thought they were safe in getting him to introduce visitors. In this instance, Bailey said that when he got up to introduce the distinguished guest, the opportunity was one he couldn't resist, so he talked on and on. When he finally finished and made the introduction the visitor said: "Mr. Bailey has told you everything I thought of saying, so I will sit down."

Mark Twain was always delightful as a lecturer. Bill Nye made a large

part of his income from his talk, and when he went out with James Whitcomb Riley, the combination was invariably successful. During the latter part of his life, when his humor was fading, John Kendrick Bangs made a large income from his lectures. So it is with Irvin Cobb. I could listen to him every other night, but to read his more professionally humorous writing involves a certain coyness in the approach.

Another reason why, up to the end of the war, the professional humorist flourished in this country, was because satire was unknown. Now that sentiment is dying, if not altogether dead, and satire is growing up, it will soon be no longer possible for a man to make a mountebank out of his own personality, thinly disguised as a clockmaker, as in the case of Sam Slick, or as the keeper of waxworks, as in the case of Artemus Ward. Artemus Ward poked fun at the Shakers by implying that they displayed natural human emotions when they "yayed" and "nayed." Bill Nye, who had undoubtedly a genuine sense of crude humor, used natural objects and displayed them in an eccentric vocabulary, as, for example, when he described a cucumber entering a stomach.

***When Bill Nye Was at His Best***

Satire, now beginning to take on its atmosphere among us, must still go through a considerable enlargement to bring forth good fruits. Satire is always preceded by burlesque, and of this, our professionals have surfeited us. Thus we have had George Chappell with his Dr. Traprock, Robert Benchley's take-offs on scientists and economists, and Donald Ogden Stewart's individual burlesques on American history, etiquette, and, more recently, banks and bankers.

Our humorists have hitherto given us very little real information, except that which comes from imitating certain characters they have listened to, or with whom they have associated. These characters have perhaps too often been themselves, thinly disguised, or not disguised at all. It is mostly physical, not intellectual. Irvin Cobb puts himself on the operating table, and makes us laugh at the feeling we get by his amusing description of his own sufferings. For this same reason, so much of the humor of Dickens is painful reading for us today. Bill Nye told me once that he wrote his best humor after he had broken his leg. It is this insistence on the purely physical that we are coming to recognize as very crude stuff. It is allied with the hose-squirting, rubber-hammer-beating comedies of the movies. We are moving up a peg. We may develop a sense of humor yet. One sign of it is the passing of the professional humorist.

Neither must we be fooled by the enormous mass of standardized buffoonery, the comic strips and the fun pages syndicated everywhere; largely pictorial and much of it distinctly horrible. Grant said at Shiloh that if you wanted to know how an army was going the worst place to find out was by observing the stragglers and slackers in the rear. Our advance is very considerable. We are beginning to discover that the intention in itself to write humor is enough to defeat its very purpose, or in other words, the only real humorist is the one whose humor is incidental.

There was a time when I thought it a part of wisdom to be made to laugh at the misfortunes of others, or to hold up my own misfortunes as a subject for the laughter of others. Now I see that true laughter is born only out of the exposure of ignorance. And this is an increasingly delicate matter, because it involves the high principles of art.

We shall see how utterly impossible the professional humorist is, and just why he must ultimately, and I believe very soon, laugh himself out of court, if we but glance for a moment at his method. First, he must find something to laugh about. Second, he must write of it in such a manner as to make people laugh.

There is undoubtedly plenty to laugh about, but we must have our own way in respect of this. We do not like to have another man thrust a subject upon us, and —too frequently in his very title—say to us, "Here is a subject I have selected for you to laugh about." We know he does it in this way because, having, either consciously or unconsciously, examined several previous specimens of his professional humor, we can tell it afar. We can hear the wheels go round before we cross the threshold. The machinery is tuned up enough. It is very much like a well-constructed radio set in which you can get any station you like. The trouble is, you don't want to.

Recently there has been an outburst of humorous verse, all or most of which is so well written, so facile and smooth, that the wonder grows as to how any young person can learn to do it so well in so few years of practice. You read on to the end, and then slip off. Nothing has happened. You are where you began. As for prose, if any smart young man succeeds, by some incredible ingenuity, in inventing even the semblance of a new form, it is seized upon and torn to pieces by a whole pack of incipient humorists.

I recall that, many years ago, in a fit of deep melancholy, I thought of a head, "If Everybody Told the Truth," and then added some snatches of conversation based upon this assumption. The result is that this form has been used ever since and bobs up periodically. Similarly, my friend Dorothy Parker, sometime during or shortly after the war, wrote a song of hate, as applied to things to be satirized, and since then songs of hate in one form or another have been constantly written by desperate professionals.

***Laughter Not a Form of Happiness***

How else, you may now ask, can our weakness be uncovered if not in this way, even if it appears to be mechanical? Lord love you! I am not criticizing this way, by itself. I am only pointing out that the professional humorist can no longer stand here. He may use this way quite properly, but he must see that it is only a stage in his progress. It is impossible to be a humorist alone. It is only possible to be a humorist when one is almost everything else.

If I wish to bring home to people the combination of greed and stupidity and shortsightedness which permits so many grade crossings to be the means of killing people, or if I wish to show up the necessity for public parks and the same greed and stupidity which makes their desecration possible, then it is right and proper for me to use all the old tricks of humor and ridicule that I can employ. And my public will encourage me and applaud me in doing all this. But when, merely for the doubtful purpose of maintaining myself, lacking accurate information or deep-seated desire to be of general service, I employ what talent I have in turning out hack-work, then I must perish.

It is no indication that a man has a sense of humor merely because you can make him laugh. It is no longer necessary to make people laugh. Laughter is not even a crude form of happiness. The man who laughs till he cries does not repeat himself in that respect, or if he does, it is only an imitation of his first emotion. What is getting to be necessary is to make people think, and to make them think requires much more than the mere stringing together of your information, as accurate and complete as it may be. People everywhere want to be informed, but more than this, they want to be illuminated. The true humorist is one who uses humor only to illuminate the way. He is a student in the right sense. That is why true satire is so long in coming. A satirist is not only born but he must make himself.

A true satirist must reach the final point where he is in love with the thing he satirizes.

A true humorist must reach the final point where his humor is so universal that it is impersonal; where he even forgets himself. Does this seem impossible in America? Believe me, all impossible things are possible.

## Pretenders Who Got Away With It

(*Concluded from page 15*)

prone to confess to crimes committed by others and to claim different identities. This was the case with David George, the Enid, Oklahoma, suicide of 1903, who two years previously, while under the influence of an overdose of morphine, claimed that he was John Wilkes Booth, the assassin of Abraham Lincoln, and who told an entertaining story of how he escaped from Washington on the fatal night.

There is far greater interest in John Wilkes Booth *escaped* than in John Wilkes Booth *captured in the Garrett barn*, for about him *escaped* there will always hover that air of mystery, of uncertainty, of romance, to fire the imagination, and as long as there is mystery and uncertainty there will be lost heirs and royal pretenders and we shall have these peculiar instances of marvelous fiction. And just as long as people are too prone to intellectual laziness to ask or search for sensible proof will there be those who will believe these wild tales—and the wilder the tale the stronger the belief.

## Royal Indian Navy

AND now a Royal Indian Navy is projected. Recently a door of opportunity was opened to East Indians to obtain commissions in British native regiments, which have through many troubled years proved their stability and loyalty. The Indian Marine, whose transports and survey vessels have many Lascar crews, is to make natives eligible to rank as officers. From this marine will develop the Royal Indian Navy, with its own regulations, and in course of time its own sea customs and traditions.

An Indian navy is a revolutionary institution, for the Hindus of old times hated and dreaded the Black Water and despised all who crossed it. That ancient country, visited by many ships, did not send forth ships of its own. The great maritime powers which have ruled India wholly or in part, Portugal, Holland, France, and England, no more expected to see an Indian fleet at sea than to hear of the natives of the Caribbean paddling to Europe from the Spanish Main. The Royal Indian Navy is evidence that the East is changing.

# The Man Without Red Hair

(*Concluded from page 2*)

well the money side of it, wouldn't he?"

From the intimate pictures of the terrible exigencies of the work that both English and American lecturers had given me, I was heartily inclined to agree with him.

"But if I hadn't liked the people, hadn't really cared for the Americans, you couldn't have persuaded me for a million in money to come again."

Knowing the Englishman of his class of mind and culture, I believed him.

"I have seen some ridiculous statements of the supposed earnings of the popular lecturer," continued Walpole. "I am free and glad to inform you that what I make over and above expenses during and from one of my American lecture tours is intrinsically less than I would have netted had I stayed at home. I don't feel that I have ever quite recovered a fair financial balance because of the disaster on my first lecture tour, when my touring agent went bankrupt. On my second trip I made something to be sure; but bear in mind that I did not write a line on the trip, nor do I employ the American background in my work."

Terrace in front of Hugh Walpole's house, overlooking Derwent Water.

I made a few rapid calculations of the amount that I knew a man of Hugh Walpole's caliber could earn with his pen during the six months or so he spent catching midnight trains, plowing through snowdrifts on several-hundred-mile jumps, missing meals, talking in ill-heated halls and in drafts night after night regardless of whether he felt well or ill, homesick or blue—well, I am convinced that he could have made more money sitting in that big armchair in his cozy study in his own dear London.

Why, then, does he do it? The spirit of adventure, I suppose, that makes one want to see what the other fellow's land is like.

"I've lived abroad so much," he explained. "I like the way one may express his feelings, which is not done here in England, you know. I actually find in America more of my own kind than I do here. They don't think you foolish there when you express yourself emotionally and honestly, as they often do here.

"I find the critics on both sides of the water are usually persons who have never crossed. The other night I was speaking in public in a friendly way about America when someone in the audience raised his voice in protest. I was more angry than ever when I found that the speaker knew nothing about the States. There should be much more intermingling between the two countries. I think it would be a wise and most excellent plan for every public man to live abroad if only for a few months, then he could come home and speak intelligently about international problems.

"You Americans move so fast, and carry me with you until I am breathless. I usually make straight for my circle of New York friends, and run off again. It seems as though I had been with them just long enough to shake hands.

"During one of my tours I seemed to see more people than the world can contain. I would really like to spend two or three weeks in every town, but then I would never get back to England. I never have time on these mad dashes really to know anyone.

"All the people seem so intent on making you happy. In England they don't care, and they are afflicted with a marked slowness in making friends, but once friends are made here, they are worth having. Yes, in America you are much more hospitable.

"All this is confusing to the English temperament. We can't expect when they have been so nice to us in America that they love us with all their hearts. Meeting a person for an hour on the one hand, or the friend of a lifetime on the other, is quite a different matter with us. But that shade of distinction is not marked with you and it tempts one at first to remark that the Americans are superficial. There is an abyss between friends and acquaintances at home here.

"By not indulging in this social convention, I think we are often considered cold. Our very accents are apt to sound to the American ear as patronizing or superior, whereas it is the very last thing that most Englishmen feel. They all want the Americans to like them, and they feel it when they don't. But you never know this, since the Englishman is so averse to showing *anything* that he feels.

"It is strange how very little a novelist can do about his own writing even," said Mr. Walpole whimsically, as he regarded his dead pipe for a moment and then gazed into the heart of the fire. "One learns technique and makes elaborate and definite plans, and then sheer inspiration will come along and upset them all; for no matter what the writer may want to do, he is influenced so much more by the things he had no idea that he was going to do.

"For instance, every writer at some time or other becomes rebellious against the critics, and he will say: 'What the devil! This work was not altogether in my power, I had little to do with it.' And sometimes, when you are accorded great praise, you feel somehow that you've no right to it. Just as when *you* are blamed, you feel it a bit unjust.

"I would like to write this and that, but in the end it is not what I would like to have done, but what I actually did do.

"This profession of writing has many of the features of working up any business. You always have some gigantic end in view that hasn't begun to be accomplished by simply writing a book now and then. I am always being summed up, *as though I had finished.* It began with my first book, *Fortitude,* and it has been going on ever since. The critics always turn to the world and say, 'There, see what he has done.' But I am only in the midst of my work. I feel that I have not yet done anything, or at least anything in comparison with what I intend to do.

"After all, then, nobody by his comments makes the slightest difference ultimately to your work. Should it come through all literature after you have finished, it will then occupy the position it *should* occupy. Critics or commentators cannot help or harm it in the long run."

The same refined charm and finish that one finds in his books, I found in Hugh Walpole himself: earnestness, straightforwardness and an almost ingenuous desire to please, deeply grieved when he fails to do so. That is the sort of man Walpole really is.

## Diarists Withhold Comment

IT IS becoming customary for authors to attempt to spare their posterity. Mark Twain requested that his autobiography should not appear until several years after his death. It appeared this year, but the reason for his request remains a mystery. A. C. Benson left his diaries and papers to be sealed up for fifty years because he "had written very freely and intimately about living persons and private matters." Henry Savage remarks: "His great revenge, perhaps, for a long life of sleep."

# Joseph Pennell ~ Etcher and Critic

Mr. Pennell used as the subject for this etching the largest suspension bridge in the world, between Camden and Philadelphia.

## Chats With the Friend and Biographer of Whistler, Who Has Realistically Pictured the Poetry of Industry

By ALICE MacFARLAND

JOSEPH PENNELL, eminent American etcher and lithographer, evidently shares the "objections to biographies" expressed by his beloved Whistler, who wrote: "Determined that no mendacious scamp shall tell the foolish truths about me when centuries have gone by, and anxiety no longer pulls at the pen of the 'pupil' who would sell the soul of his master, I now proceed to take the wind out of such speculator by immediately furnishing myself the fiction of my own biography, which shall remain and is the fiction of my life."

Long before he completed his self-imposed task, Whistler realized it to be too much for him, and he authorized his friends, Joseph and Elizabeth Robins Pennell, to take it up, giving them innumerable notes, and evening after evening of talk from which Mrs. Pennell made notes. All the world knows how well, and with what sympathy and understanding that work was done in *The Life of Whistler* and *The Whistler Journal*. Mr. Pennell, evidently apprehensive of similar catastrophes in the way of biographies, has written his own, or at least that part of it which deals with his work as an illustrator.

His book, *The Adventures of an Illustrator*, follows the course of illustration in America from the early days when the *Century* printed his first "Wonder of Work" etching, through the narratives of his journeys to the cathedrals of Europe to illustrate the works of famous authors, down to the present day—despised by Pennell, when photographs are replacing works of art as illustrations. He disposes of the present neatly and with a certain naïve egotism in the heading of his last chapter, which he calls, "The End of My Adventures as an Illustrator, and the End of American Illustration."

The book begins, like all good autobiographies, at the beginning; but Mr. Pennell expresses considerable doubt about just when the beginning was. It was, in any event, in Philadelphia, in a Quaker family that he first saw the light of day, and he thinks it was in 1860, and that perhaps it was on the Fourth of July. A good patriotic birthday to choose when the records of the family Bible, and in the Friends' Meeting House, are destroyed. He traces what he knows of the family genealogy, and disclaims all the people of his name who seek him out to claim relationship, for, he says "they all want something."

When a man went to him once in London, claiming knowledge of his father, whom he had known when he worked on the *Ledger* in Philadelphia, Pennell's answer was: "I never had a father. I never heard of Philadelphia. What's the *Ledger?*" in much the same spirit in which Whistler replied to the American who enthusiastically informed him that both he and Whistler had been born in Lowell, Massachusetts, and that there was a year's difference in their ages. "Very charming," said Whistler. "And so you are sixty-eight and were born in Lowell, Massachusetts! Most interesting, no doubt, and as you please. But I shall be born when and where I want, and I do not choose to be born in Lowell, and I refuse to be sixty-seven!"

The early record of the little Quaker boy, who was never lonely when he was alone, of his family, of "Friends' Meeting," of his first bicycle (the first of many, for he was one of the first to take up cycling), gives a vivid picture of the times in Philadelphia, and of the beginnings of an artist, for he learned to draw when he was very small, and was, he says, an illustrator from the beginning.

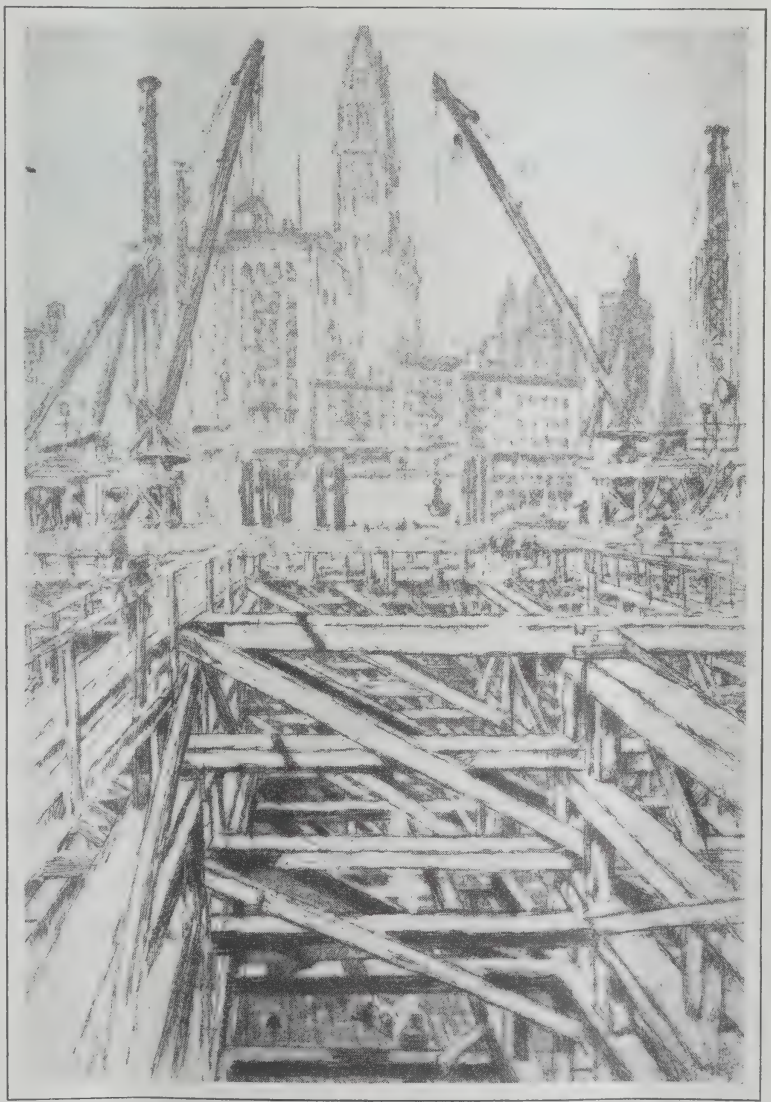
Certain poignant memories of the assassination of Lincoln and other events of the time were indelibly impressed upon the sensitive mind of the young child. After graduating from the Germantown Academy, where his friendships and enmities were even then well defined, he went to the newly opened Institute of Art, from which he was later, to his immense satisfaction, expelled. Following that he went to the Academy schools.

An anecdote concerning the criticism of one of his first drawings there shows that sensitiveness which is the clue to many of the bitter enmities for which he is famous. He was drawing the head of a Roman senator—"one of those old Romans who look exactly like the average American; under them Rome fell, and we are going the same way"—and he was sitting beside a man named Wimbush. The professor entered, and after extravagantly praising the work of Wimbush, took one glance at Pennell's drawing and said: "Vy you dry do improve on der gast?" "That criticism," Pennell writes, "would have done most students good. It did me harm. Had he taken the same trouble to tell me where my work was bad, even if all over, as he did to praise the superficial correctness of the prize student, it might have been of some use to both of us, certainly to Wimbush. However, the Professor and Wimbush have disappeared; I still rest." The evident joy of repaying old scores, even when the offenders have "disappeared."

Among the stories that are told about most great or interesting men, particularly those of the type of Whistler or Pennell, who might well have said some of the things tradition accredits to them even if they

didn't, is one about a friend of Pennell's, who had been the recipient of some of Pennell's brilliant verbal abuse and said to him: "Joseph, one difference between you and Whistler is that where he uses a rapier, you use a bludgeon."

The bludgeon is unsparingly used in his book—all through—but after reading it one can readily see that it is never used save in response to some wound to his sensitiveness, particularly if the wound is dealt to art or beauty, his ideals of which are uncompromising. He is an indefatigable worker, and one who knows no half measures, or sympathy with those who employ them. The beauty of architecture, of the "wonder of work," was always apparent to him, and led him to create a new vision of sky lines, shipyards, old ferry houses, factories; of countless things that were previously unnoticed by the artist.



Of music or the art of the theater he knows and cares nothing. "I hate the theater," he says. In a description of a visit to Bayreuth, Germany, when he and Mrs. Pennell saw *Parsifal*, he says: "It was a question of spending sixty marks on another performance or on old beer mugs instead. We never use the mugs and they are gone." Of the plays by his friend Bernard Shaw, *Cashel Byron's Profession* is the only one he ever read—"and that because he gave it to me, though once later I heard him read *Candida*, and that was enough for me."

In the introduction to his book, he explains that some of the chapters, since thoroughly revised, have appeared in the *Century*, the *Illustrated London News*, and other papers, but he does not state that the chapter on Aubrey Beardsley is part of a lecture he delivered at the Brooklyn Museum of Art, and was later made into a book and privately printed by the Pennell Club of Philadelphia. It was that circumstance, however, which led to my first personal knowledge of him.

I was in the rare-book offices of a prominent New York dealer when the president of the Pennell Club came in to ask that a first-rate stenographer be sent to the museum to take down the lecture, and, after considerable searching, we sent the best we knew. The lecture became unrecognizable beneath the stenographer's expert touch, and was brought in to us with Mr. Pennell's corrections. She had tampered with the names of the great and the near great, calling the dignified Burne Jones, "Burt" Jones, and otherwise proving that a knowledge of stenography does not necessarily include any idea of English art. I looked at the incomprehensible manuscript, made more difficult to decipher by Pennell's voluminous corrections and virulent comments, and, in a moment of temporary mental lapse, I offered the services of my two-fingered method of typing to try to clear up the muddle.

It was, I am afraid, an indifferent job at best but I am glad I offered my dubious services, for the incident led to my meeting Mr. Pennell and eventually becoming, for a time, the secretary of the Pennell Club in Philadelphia.

It was interesting to see the tireless struggle to have things just as he wanted them, which led to the making of that perfect little book, *Aubrey Beardsley and Other Men of the Nineties*, by Joseph Pennell, published as the third book of the Pennell Club in 1924. The edition was limited to a hundred copies, and is now, of course, completely out of print and at a premium. And what a treasure to the Pennell collector, in case they are still to be had, would be the corrected proof sheets of that book, containing Mr. Pennell's opinion of the printer (entirely unfavorable, by the way).

The erecting of the Brooklyn Edison Building offered Mr. Pennell an impressive industrial motif.

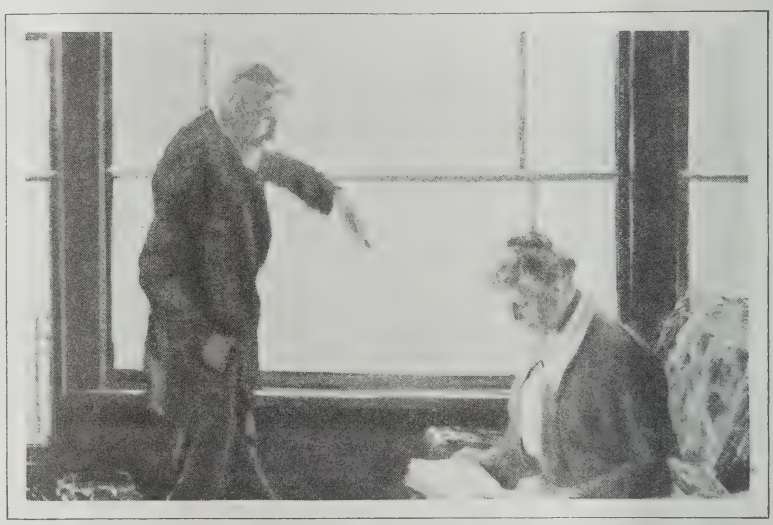
My first glimpse of him was in his classroom at the Institute of Art, surrounded by his pupils and his presses, a tall, thin figure, with very kind, very blue, eyes set in the face of a dreamer. During the time I spent in Philadelphia, I was continually among his friends and enemies and collectors of his etchings and water colors.

I had heard of Mrs. Pennell many times, but had never seen her, or a picture of her. I was told, however, that she looked like a duchess, or rather, like a duchess ought to look, and that must have been enough, for one day, when I was quite alone, in walked a lovely, gracious lady who asked for the president of the Pennell Club. I unhesitatingly ventured, "Mrs. Pennell?"—and was right.

It is told in the Whistler *Life* how, when the Pennells were going on a cycling trip across France to Switzerland, Whistler decided to accompany them as far as Dieppe. When they met for dinner there—Whistler, immaculate as always in evening dress, and the Pennells with only their cycling costumes—Whistler gave his arm to Mrs. Pennell and said, in reply to nothing at all, "*Mais oui, Princesse,*" thereby gaining the respectful attention of the assembly, head waiters and all. So, you see, anyone who could successfully pass for a princess in France in the cycling costume of the eighties must look, in the costume of our time, even in a supposed democracy, at the very least a duchess.

During my stay in Philadelphia, Mr. Pennell came there to make some etchings of the Delaware Bridge, then in process of construction. George J. C. Grasberger, rare-book dealer, and president of the Pennell Club, had obtained the necessary permits for him to go wherever he wished on the bridge. We waited eagerly to see the result. When it came (he only etched one plate), it was called "The Ugliest Bridge in the World," and when we placed it, innocently enough, in the front window of the bookshop, it occasioned a storm of protest from the press, and all the Pennell collectors rushed in to try to secure one of the few impressions that were made. One serious-minded Philadelphian, an architect, name unknown, came in with drawings he had made, containing proposed changes to be made in the bridge, which he wanted us to send to Mr. Pennell for his approval. Needless to say, we discouraged him from his project, which most certainly would not have met with approval from Mr. Pennell.

Soon after the bridge episode, Mr. Pennell came over to address the Art League, and about the same time we had a visit from John Lane, the well-known publisher, of London. From both of them we heard of the reunion they were having in New York, the talks of old times; the dinners at a famous old French restaurant where it is still possible to really *dine* according to Mr. Pennell's plans and specifications. It was, for me, very wonderful to hear Mr. Lane talk of the great writers whose books he had published. How many questions I asked him! And how many more I wish I had asked him! For now I can question him no more, nor can he and Mr. Pennell have any other reunions on this earth, for, soon after his return to England, he died.



To return to the book—there is a vivid picture of Philadelphia in the seventies, of Whitman as he used to see him, of Charles Godfrey Leland, who came to be associated so closely with his life and work, and whose niece, Elizabeth Robins, was later to become Mrs. Pennell. Of Leland he says, "he was the greatest Philadelphian of his time, but no Philadelphian knows this—or anything else."

He recounts his trip down the Mississippi to New Orleans to illustrate an article by Cable; his first trip to Europe to make a series of twelve etchings for W. D. Howells' articles on Tuscany, and from this time on his book is rich in tales of travel and adventure; filled with graphic sketches of the famous authors with whom he worked. The account of his trip with Hamerton, that trip which marked the beginning of house-boating, and which Hamerton described and Pennell illustrated in *A Summer Voyage*, the antics of the recalcitrant donkey which was the motive power of the boat, the discomforts, and the ludicrousness of suspecting Pennell of being a spy, are told with characteristic humor. His sojourn in Russia, to draw the "Jew at Home," brought before him many amazing places and people, and his description of the great festival at Kiev, where he witnessed the living death, is etched as clearly in words as one of his own plates.

Equally graphic in detail are the accounts of the funeral of King Edward and the coronation of King George, both of which he illustrated from nature. He had permits to attend all the rehearsals. "Of the hundreds of artists there, the only persons who did anything of importance that day were Sir Benjamin Stone, the photographer, and the cinematograph people, but they were not artists. As for the remaining two, E. J. Sullivan, also working for the *Chronicle*—I got him the commission—climbed on to a tomb and made a sketch, and I, well, I was as usual the only person who had any sense, for, as I have said, my conditions were that I should have a seat in the organ loft, and that I should attend all the rehearsals and the ceremony from the same seat."

There is a chapter devoted to the famous guild halls of London, not only describing the beauty and richness of the halls themselves, which he drew, but the solemn rite of dining which, being convinced that dining is a lost art in America, he appreciates to the fullest extent. "Most new Americans have never dined—decently," he says in disgust.

Ten years of his life were spent in the cathedrals of Europe, which he knew and loved and drew, many times on cycling trips with Mrs. Pennell who wrote the text for some of the books. He drew the cathedrals of Italy, Spain, Germany, Belgium, England and France, and would have doubtless spent many more years in happy work there if the war had not interfered and sent him back to his native land—the war that ended the world, according to him, ended at least the world he knew and loved and worked in.

*From a painting by Wayman Adams.*
J. and E. R. Pennell at their Brooklyn window.

Maurice Hewlett, F. Marion Crawford, Vernon Lee, Sir Edmund Gosse and Henry James are among the authors for whom he illustrated. The years of his life in London, particularly those bright days at the Adelphi Terrace apartment (now occupied by Barrie), which marked his close association with Whistler and other great men of the nineties, are all too briefly touched upon. Such a description as the following whets one's appetite for more, and for snatches of the good talk which filled the room: "Hatrick, Sullivan, Beardsley and Walter Crane would be there, and McClure Hamilton, and we would have to rush him out if Whistler came, and George Moore and Sickert and McColl would look in. That was before we all fought."

And then the war, and his broken-hearted part in it, and his return to America. "I admit I am a failure as a war artist," he says, "a recorder of war at the front, for I loathed what I saw so much that I could do nothing—no one gave in art or literature any idea of the war. No one could. No one will. It would stop war, but I cannot forget what I suffered, and I suffer still when I see the old world jazzing through the ruins."

From the windows of his Brooklyn home, he can see "the most beautiful thing left in the world," New York, the unbelievable city, which he describes as "The city that has been built since I grew up, the city beautiful, built by men I know for people I know, the city that inspires me, that I love." And one imagines that he found a great deal of pleasure in writing this book, sitting within view of his wonder city, with "E." at his side, ruminating over old days before the war and prohibition "spoiled" his country, the country which he finds picturesque and lovable even when he scolds at it.

His story, which is told in a rambling, desultory style, is readable—delightfully so. His occasional outbursts against the lack of appreciation and knowledge of art in America are more understandable when one realizes how much more Europe has valued this great artist than we have. The French Government treasures his prints and drawings in the Luxembourg, and they are highly rated in Germany and England. But that is characteristic of America. We only accepted Whitman when England had done so first, and finally received our own Poe at the hands of Baudelaire and France.

Mr. Pennell frequently describes his methods of work—drawing from nature only, and always printing his own proofs. "All artists who really etch pull their own proofs," he says, "for the printing of a plate is as vital to its success as drawing or biting is. But most etchers are not artists and their plates prove it, for if any method proves an artist's power of observation, selection drawing, it is etching."

Again he tells of always drawing straight on the plates, which accounts for all proofs drawn from nature being reversed in printing. It was in Salisbury, searching for a certain view of the cathedral, that the following ideas of impressionism first occurred to him: "I found that I must also give the feeling of the place, the impression it made on me. This is impressionism and not the putting down of spots, blots, cubes and other mannerisms. This is the impressionism of Piero della Francesca, Velasquez, Claude, Turner, Constable, Whistler. It is not rendering the subject as it is, but giving the sensation it makes on you, and if that sensation is strong enough, others will feel it. That is impressionism—art."

It is impossible to refer to Mr. Pennell's book without some reference to the remarkable and profuse illustrations. Etchings, drawings and lithographs by Mr. Pennell are reproduced, many of them for the first time, and there are a number of interesting portraits of the persons referred to in the text, and portraits and sketches of Mr. Pennell by Whistler and others.

The make-up of the book, the printing of which was supervised by Mr. Pennell with what care only one who has seen his corrected proof sheets can imagine, is most attractive.

So completely his own has Mr. Pennell made certain subjects that some of us, when we see the irregular, jagged lines of tall buildings soaring toward the complaisant sky, or a great hole in the earth from which a skeleton steel structure arises, are apt to say: "What a subject that would make for a Pennell etching!" He sees the dream which lies behind the building of all things, and, being a great artist, he makes us see something of his vision.

# Nations Would End Passport Nuisance

(*Continued from page 5*)

go to Europe on a certain day by a certain steamer was made but three days before sailing time. My previous passport had expired by a few days. Its presentation was sufficient identification for getting a new one. The application was filed in New York one Wednesday afternoon; I desired its return Friday morning so that I could have the day to obtain the half-a-dozen visas involved. I have been a newspaper man for more than twenty years. I am well known in New York and Washington. The object of my trip was decidedly professional.

Why do newspaper men, correspondents, writers, authors, go abroad on professional business? To crack safes, or kidnap babes, or start rebellions? It seemed to me that it would have been better to have had one's stuff written before departure, to present to the passport control officer to prove just what one was going abroad for.

Did the passport return on Friday? It did not. It was there Saturday morning, and had my steamer sailed at 10 o'clock I should have been out of luck, because in an hour I could hardly have obtained the British visa and made the pier uptown.

Fortunately, the *Leviathan* did not sail until 2 o'clock, due to tide conditions, so the State Department's routine merely annoyed me, besides depriving me of $10 for the privilege of being kept in suspense. A train wreck containing the passport pouch from Washington would—the clerk informed me when I spoke about this possibility—have sent me away on an emergency passport issued at the New York office.

The Department of State informed me some time ago, that during the year ending June 30, 1920, $348,324.44 was collected in passport fees. That was the last fiscal year prior to the date in which the $10 fee became effective.

For the fiscal year ending June 30, 1925, the passport fees totaled $1,452,584 and visa fees in the amount of $3,584,192.60 were collected.

The head tax, primarily established (originally it was $4) for the purpose of defraying immigration control and supervision expenditures, must be paid by those who involve no charges of the kind, any more than Americans traveling abroad are asked to pay the expenses of supervising their entry. Thus the head tax is another item that should be eliminated.

Another situation is that affecting several countries, notably Germany, in which thousands of prospective immigrants who paid the $10 visa fee have not been admitted to the United States owing to the new immigration law, virtually barring them indefinitely. The German Government made representations to the Department of State, suggesting the refund of the $10 where visas were rendered unavailable by the new immigration curb. The State Department expressed regret, but pointed out that no provision was made in the new act, or other law, for refunding the fees in question.

It is alleged that the war debts are responsible for much of the ill feeling with which Americans are regarded abroad, but while this is partly true, it is much more likely that the passport cost precedent established by this country is chiefly the cause of the trouble.

The emigrant who sells his few effects that he may go to the United States is more apt to grumble, when confronted with $10 visa and $8 head tax charges, than the fellow who stays at home and reads about the debt-funding terms. To the former $18 is $18, and perhaps a no small part of what he gathered together, whereas the non-emigrating fellow contributes no such sum to the extinguishing of the debt.

The Chamber of Commerce of the United States issued a statement saying that "passport visa charges and regulations are an unnecessary burden on business travel in foreign countries. Our committee has received reports from business men of cumulative passport visa charges on business travelers that amounted to as much as the cost of an ocean passage in a de luxe stateroom before the war. Further, the red tape incidental to obtaining visas often consumes a great deal of valuable time and interferes with the transaction of business."

Frank C. Clark, in a letter to a member of the House of Representatives, wrote in part as follows:

"From thirty years' experience in arranging foreign cruises and conducting more than 20,000 American tourists through every civilized country in the world, I heartily agree with the condemnation of our passport system which you expressed upon your recent arrival here from Europe. Our passport system at present is not only valueless, but a positive injury to commerce and a handicap upon the comfort and convenience of travelers."

It is held by many persons that the visa is unnecessary. That is a too liberal view. The visa seems unnecessary until certain names are encountered. It will never do to have a passport which will guarantee ingress and egress anywhere at any time to any one. Governments must reserve to themselves the right, even if unjustly exercised, to determine who is welcome within their respective frontiers.

Obtaining a visa, however, should not be any more vexatious than registering at a respectable hotel. A simplified passport system would in due time lead to a simplified visa control, which largely is a matter of centralizing the routine so that a traveler does not have to go all over a big city to obtain visas. Many tourist agents assume the task of obtaining the necessary visas.

Maritime authorities, after much thought and planning, have devised the so-called nonclass tours and group tours with a view to utilizing former third-class space. Nothing is so absurd as that a tourist, intending to visit a few countries in a few weeks at a cost of less than $500, shall be penalized from $40 to $70 for visas—a nearly prohibitive percentage.

If it is true that certain governments remit, or do not charge, visa fees to foreigners using their ships, the United States might well afford to furnish free passport or visa, as the case may be, to those traveling on ships flying the American flag.

## Bird That Lays $1,500 Egg

PROBABLY few persons know that the Pacific Coast of the United States is the home of a claimant for the title of the largest bird that flies. This is the California Condor, whose only rival for size is the Andean Condor, found only in the Cordilleras of the west coast of South America. In addition to holding a record for size among birds of the North American continent, the California Condor lays an egg valued by museums and collectors at $1,500 to $2,000—almost in the class of the eggs of the long-dead Dinosaur.

And now comes the word that the California Condor is rapidly passing to join the Dinosaur, the Great Auk, the Labrador Duck and the Silvertip Grizzly in extinction. The California State Fish and Game Commission, which has been making a special study of the Condor, is authority for the statement that today there are no California Condors living in a wild state outside of nine counties in California, and that there are only about 50 of these birds even there, where they nest in the high and almost inaccessible ranges.

The wing spread of the California Condor is nine to twelve feet, as compared with seven to ten feet, as an average, of the celebrated Condor of the Andes, which is believed to be the original of the fabled Roc. The California Condor is a direct descendant of the prehistoric super-condor, *Teratornis merriami*, which had a wing spread of eighteen feet.

The California Condor, once paired, remains mated for life, and, if one of a pair dies, it is believed that the remaining bird never takes another mate. The female lays only one egg, rather larger than that of the largest domestic goose, and the young birds remain with their parents for two seasons before setting up a family of their own. The nest is a hole or cave in a cliff, deep in some inaccessible gorge, and the egg is laid on the bare floor of the cave. Only 41 eggs of this bird are in museums, as compared with more than 70 of the Great Auk, which has been extinct for some years.

Extinction of the California Condor—to which naturalists are now witnesses—is due largely to the desire of the miners in the days of the gold rush to California three-quarters of a century ago, for the large and hollow quills in which to carry gold dust. Slow to rise from the ground when it had gorged itself, the Condor fell an easy prey to the rifles of the miners or even the *riatas* of the *vaqueros*, who sold the quills to the miners.

Poison for mountain lions, bears, wolves, wildcats and coyotes, placed in dead animals by the ranchers, also accounted for many, while careless collectors for museums nearly completed the job of extermination before the State of California took a hand and protected the birds and their eggs with heavy penalties. Laying only one egg a year, and requiring two years to arrive at the mating stage, makes the increase of these large vultures slower than that of almost any other bird.

With his huge beak, bare, orange-colored head, heavy neck ruff of glossy feathers, great wing spread and two large white patches under the wings, the California Condor is a majestic figure whether at rest or in flight. According to stories told by early residents of California, the Condor was monarch of the air, easily able to whip a golden, or even a bald, eagle. Condors are believed to live to the age of 100 years.

## Pheasant Hunting at Home

THE farmer in Washington and Oregon no longer needs to take a week or two off and trek back into the Cascades to get his hunting. Just as his forefathers in the Ohio Valley, or down south of the Mason and Dixon's line, used to shoot wild turkeys, passenger pigeons, and ruffed grouse from their doorsteps, so this Northwestern farmer today can shoot his own pheasant from his own alfalfa or wheat field, or down in the cattle pasture.

The states of Washington and Oregon, through their game commissions, have given the farmer this opportunity by releasing thousands of these birds from the game farms each year. The pheasants so released are at least five months old when they are turned into the wild, and they cannot be shot until the middle of October, when, for fifteen days, with strictly limited bags, the farmer can have fine bird-shooting on his own land.

It has been found that the common variety known as the Chinese pheasant, lies best to dogs, flies hardest and most indirectly, reproduces itself best in the wild, survives its natural enemies in numbers, and furnishes the largest and best-flavored body for the table. The male bird is very beautiful, and a very artful dodger, easily fooling even a trained dog, and making hunting difficult. The female, smaller than the male and less brilliantly colored, is partially protected by the law even during the open season, when only a small number of hens, compared to the number of cocks, is allowed to be bagged.

The birds are reared on the game farms from eggs taken from the hen pheasants just as soon as they are laid. If left to her own nesting, the hen pheasant will lay 12 to 14 eggs and then stop laying, but if the eggs are taken from her, she will lay from 40 to 50 in a season. The eggs, of which about 97 per cent are fertile, are then placed under hens, the bantam and other small breeds of domestic fowls being used for this purpose. Immediately on being hatched, the tiny pheasants, which are smaller than even bantam chickens, attempt to run away from their foster mother and hide. During this period they are kept in small closed pens, where they must remain close to the hen, and so gradually become accustomed to her and obedient to her calls.

Soon the birds become accustomed to the hen, follow her about as would her own chicks, and obey her calls. They are, however, extremely shy of man, and when they see even the well-known keeper approaching, flee in all directions. Unlike chickens, they do not fly for safety to the hen, but seek to hide independently in the long grass.

When the birds are five months old, they are distributed to various points in the state and released to shift for themselves.

Possibly the most interesting feature of this effort on the part of the game commissions of both states is the economic side of the raising and distributing of these birds in the farms and ranches, instead of in the more distant, and, apparently, more suitable, mountain ranges. Today the hunter in almost any town or city in either of these states of Oregon or Washington, can get the limit bag of pheasants in a half-hour's drive from his municipality.

Farmers in the Northwest at first complained that the pheasants were destroying their crops but the value of the birds as a food supply speedily offset this, and now the farmers are the best protectors the pheasants have during the closed season.

# Which School Is Best for Your Children?

(*Concluded from page 8*)

are important phases of child training, the second-grader in a public school is usually more advanced than the fifth-grade boy in a small private school. The large private schools, after all, are really only good public schools where tuition is paid. They are perhaps a trifle better equipped and more closely supervised, but essentially they are the same.

There are other arguments besides that of "objectionable" children. Anything public leads an exposed life. The man-on-the-corner takes Upton Sinclair seriously, and knows that the public school is controlled and cursed by capitalism, and that little goslings are emerging from its doors. So he sends his son to a private school, and neglects to tell us who controls it. But his son is to be developed along "individual" lines, not "Model B" of the public school. Those of us who have several children know that *every* child is individual, and that with exactly the same heredity, environment, and training, we will produce children as different as day and night.

The children of the people in the next block go to a church school. In a church school the children will, of course, learn much more about one particular sect, but the public school children can get their training in creeds at home and in Sunday school. The ten-year-old next door is not as versed in his own hereditary Episcopal faith as he might be, but he has a surprisingly clear and unprejudiced knowledge of Baptists, Jews, Christian Scientists and Roman Catholics, gained on the public school grounds. He goes with us to the Presbyterian Sunday school, and I'm not sure what he'll be, but religious fanaticism will never touch him. In the public school he has acquired that which is more important than dogmatic denominational training—a respect for all sincere faiths.

Then there are the Pharisees within the fold. The public school is an open target, you know. The critics within have the old, familiar wail—the public school has changed. It is no longer the Little Red School House, lineal descendant of the old school. Health programs, school doctors and nurses, nutrition classes, and special work for the under-privileged child; these things have little to do with the three R's, and manual training, domestic science, health bureaus, research clinics and psychiatric workers. Is it really necessary to have all those things in our public schools, and even teach the children to brush their teeth?

*Your* child may not need the supervision that the school gives, but the school nurses find under-nourished children even in well-to-do families, and uncorrected physical defects are general. Call it governmental paternalism in the schools if you wish, but parental care does not always seem to suffice.

Your child may not need the trade school, but if every child who quits school has a definite means of earning his living we are going to have better citizens.

That was the original intent of our forefathers, you know, the making of better citizens. When our public schools were first started the strongest argument for them was that education made for good citizenship, and we must have general education to have a democratic government. After all, we aren't far from their ideals, even if a few do think it middle-class.

Parents, intelligent parents, too, do not talk much of good citizenship these days. It is a hackneyed term, and some of us would rather be thought bomb-throwers than Babbitts. We will tell the children stories from history, but we will not make a personal application. We all have a few prej-

udices of our own, and we perhaps confuse politics with patriotism.

The public school would be much too hard for little Jane's nervous system. She goes to the Wee School for Wee Tots, "two hours personal attention each day." The Wee School emphasized its short hours, and that afternoon school sessions are much too hard for the small children. In her two years at the Wee School, Jane has learned to read beautifully, but she plays abominably. The Wee School really seems to be doing its duty as far as Jane's three R's are concerned, but unless something unexpected happens, something cyclonic, like another baby in the household that revolves around all her small wants, Jane is never going to learn group contact. The small-family child needs the large-family school.

Then the six-year-old comes home from school, salutes the flag, and says: "I pledge allegiance to my flag, and to the country for which it stands." He hurries home some afternoon, hungrier than usual, because he has given part of his lunch money to help rebuild *Old Ironsides*. He directly associates *himself* with his flag, his country, and we parents realize that the public school has taught him something we *should* have taught him—and didn't.

The other day I asked the kindergarten boy what he had learned that day.

"We learned to take turns!" he said.

Some of us have never learned that.

# Chats with Office Callers

"Ding is back," said ***The Newspaperman,*** as he flung into The Office. It was good news, and it is scarcely necessary to tell anyone who "Ding" is. But for those who may be a trifle slow of recollection, he is J. N. Darling, the cartoonist. One of the best. A big national American force for general intelligence and decency. It seems that "Ding" has been ill for a year—perhaps ill and recuperating is the way to say it. For he wrote from somewhere in the New Mexican desert that he was on the way home so tough that he could open a sardine can with his thumb nail and he had to shave with a blow torch. He accompanies this hard news with a plaintive cartoon. Away back in the distance, around the track of the solar system, is a deserted sick bed, with physicians, relatives and nurses scanning a streak around the track which, upon examination, proves to be "Ding" trying to catch up with the world. He drags "the old Think Tank" after him, while the earth flies far before. The caption is—"If Anyone Thinks This World Doesn't Move, Just Try Stopping For a Year."

"Ding" will catch up, no fear. In fact, the world hasn't moved as far as he thinks it has. He will find the same old elements still in the mixture. And he will be a better "Ding" for his temporary retirement. His perspective—not that of his pencil, but of his spirit—he will find improved. It can't help but be. And he will find his public waiting and more eager than before. We writers always admire cartoonists like "Ding"; he can say more with six swipes of his pencil than we can say in a thousand words.

ɤ ɤ ɤ

***"Speaking of Mencken,*** I long ago outgrew, if ever I felt twinges of the fear that he was a corruptor of youth. It is a rather noble charge to make against him anyway, since it was the charge brought against Socrates. Mr. Mencken is a case of arrested development. He is like a doll, or a side-whisker, or a cane—he marks a stage. All youth passes through the Mencken stage. *But Mencken doesn't.* He has got stuck there. That is what makes him Mencken. The girl comes to the doll stage and passes it. The boy comes to the whisker and cane stage, and passes it—if he is normal. Youth comes to the Mencken stage—and passes it. We have all been Menckenites of one degree or another, but we outgrew it. Life pushed us on. It pushes everybody on but Mencken, and the few who, like him, suffer from arrested development, from the fixed angle. There are always those places and characters along the way of life, like cheapjacks on the way to the fair; they are part of the scenery, but they are not moving with their times. To admire the Mencken type is to indicate that one has reached a certain stage; to continue to follow him, is to indicate that one has *stopped.*"

***"'What Price Glory'*** is a true play. To that extent it may be said to have power. It is rough because it deals with rough men in a rough time. But they are men. And there is no oriental dirtiness about them—it is robust Shakespearean profanity and masculine sin. It is something of a relief from the sinuous imported kind. I am sure that *What Price Glory* is not what may be called a 'bad' play in the moral sense, though there is a certain quantity of unmoral attitude and conduct in it. The French people do not shine very well in it. Neither do the Y.M.C.A. nor God nor General Pershing nor General Headquarters. But then the play is not about the French people nor God nor the Y.M.C.A. nor General Pershing nor General Headquarters. The play concerns a few Marines of the hard-boiled type, and these reflect the type with virility and power. 'They cursed, but not half as much as might be expected by one who knows the Marines. They cursed terribly in Flanders.' They were free in their references and relation to the only woman in the play, but, then, she was that kind of woman. They had their ideas of God, which were mostly wrong ideas, created in opposition to certain other wrong—though more ecclesiastical—ideas about God. Personally the line I most enjoyed was where, after the Red Cross man down in the bomb-proof dugout had been expatiating on the soul, and a sergeant had ripped out some very common-sense remarks of an untheological nature, another sergeant turned to the Red Cross man with—'That wasn't me, God.' It was simply rich and it thrust a deep light into the essentially moral nature of men's idea of God. The play does not represent the National Army at all—the war was fought by the very type of soldier the play belittles—its parody on the General Staff is bitter and unjust; but when it comes to showing the man-stuff that lives beneath the hard-boiled surface and to portraying a type of soldier which can be found only in the American Army—God bless it!—I say the play's a wonder. It brings the spectator pretty close to the raw good that is in human nature. Yet there's not a line of sentiment in it—all that sort of thing is blown out with blasts of profanity; there's no mawkishness, even when Hard-Boiled Flagg comforts the sergeant who has gone crazy with the strain. Yet somehow it does reveal in a very impressive way some of the virtues of character which seem so little affected by the vices of conduct."

ɤ ɤ ɤ

"What makes me a good flyer?" repeated the rather ***Well Known Aviator.*** "Well, for one thing, I am a great coward. You simply can't get me into the air until I know that my plane is all right in every humanly controllable particular. I am scared stiff about going up in a plane that is not O. K. in every bolt. In fact, I wouldn't do it. Lots of small-time flyers have me beaten a thousand ways in taking chances. I wouldn't—I'm too scared. I can't say that it began in personal fear, however. At the beginning I was too jealous for the art of flying to take a bad chance. I didn't want to give flying a black eye. Every time a preventable accident occurs, it gives the art a bit of a setback. I am glad to notice that serious flyers are frowning on aërial stunts. The public has been much misled by this sort of thing. There is a flying stunt, such as military men use, which is a real part of the game. Ducking and diving, doing somersaults and tailspins and all the rest, come very useful in combat; they are the foot-work of aërial fighting. And so far they are legitimate. They also demonstrate to the public the possibility of complete mastery of the plane. But stunt flying will never make aviation a popular practice. It takes long records of safe and useful flying to do that, and such records will be made by the careful boys."

ɤ ɤ ɤ

***A Supervisor of the Poor*** came into luncheon. "Any poor people to be helped? I should say so. There always have been and it looks as if there always will be. But the poor these days are comparatively well off. They have everything they want, apparently—installment stuff, of course. Radio, piano, everything. I went to a place on an urgent call for relief and saw a good car parked up against the house. When I asked if it belonged to the family, they asked me if I thought it wasn't a good enough car. It certainly was a good one. Not paid for, of course. There was no food in the house, there was sickness and no employment. It was downright need. But still that family had not denied itself anything. About the only thing that seems to be on a cash basis today is food. Years ago people 'ran a book' at the grocery and paid cash everywhere else. Nowadays they pay cash at the grocery and get credit everywhere else."

ɤ ɤ ɤ

"I don't understand the British howl against American movies," said ***The Movie Man*** as he laid down a London *Times,* "because they are not howling against the thing that deserves it. If they complained against the *kind* of films we send to England, that would be all right, but they complain against the films being *American.* Whose fault is it Doug Fairbanks goes big in England? Great Britain has all the wild places of the earth, the wildest of all the wild people, and yet so little use has she made of her movie resources that the English people are just crazy over fake western cowboys. Think of what movie initiative could do with the vast studio the British Empire offers. While we have only Hollywood! The British lack initiative, and that is the main reason that American films go so much better than their own over there. Great Scott! imagine what the British could do in the way of spectacles. They have the movie world by the tail, but they don't know it."

# When May Boston Expect an Earthquake?

(*Continued from page 3*)

Godfrey, in response to the call prompted by his determination that the Foundation should lose no time in resuming its work now increased manyfold by the new, wider opportunities which the war had given its members to observe man under conditions of emergency, both in military and civilian life, saw the strands of its original organization drawn together practically intact in his Washington office. He heard a renewal by its members of their pledges to give their efforts to the advance of the great research on man as endangered by emergency, alike abundantly aided and mantled with a new and terrible significance by the thousands of records which had come from the stupendous laboratory of the war.

It must not be considered that the Foundation unduly underscores the imminence of earthquake. "Earthquake" is the model example of emergency which endangers man. It is most like the World War in its factors. For these reasons earthquake was chosen by the Foundation for its chapter of research which followed the war.

***All Hazardous Factors Enter Into Earthquakes***

Earthquake is an inclusive emergency in which all hazardous factors, famine, conflagration, pestilence, flood, tornado and panic, are natural ingredients. At no time has the Foundation studied earthquake *per se*; that is the field of the seismologist. But the conditions attendant upon earthquake, when it strikes men grouped in the modern city, provided the inclusive problem the Foundation sought. Thus, taking its bases of method from Johns Hopkins, it readjusted its peace-time organization to focus upon research, not merely of the former "man under conditions of emergency" but also upon "man under conditions of earthquake hazard."

War service had taken many original Foundation members into contact with specialists in military fields. At the conclusion of the war, then, it was possible to ally with the Foundation such men as Admiral William Sowden Sims, Franklin D. Roosevelt, Leo Rowe, Sir Arthur Currie, and others. Thus to the knowledge of men who had majored in the civilian and minored in the military was joined the invaluable knowledge and experience of men whose careers had majored with the military. There were, too, 16,000 records of men under conditions of emergency which were a direct result of experience by the Fellows of the Foundation with the war, making a total of 30,000 correlated notes. And an almost limitless new literature concerning men under emergency, in the light of the most recent practical example of the variety of necessities the war threw into relief, was placed squarely at the hand of the organization which would, henceforth, give it concentrated study.

The primary topic, then, was man under condition of earthquake hazard. It must be remembered that there was already a record of 91 years of earthquake history available, with 137,000 records of studied earthquakes, and that the first publication made in this field was made by Dr. Godfrey in 1907 in his *Health of the City*. The new problem could thus be approached in the authentic light of certain attested facts concerning the historical background of quakes. And nothing but observed, recorded and tested fact has been admitted from the beginning of the work.

Certain areas in the world—notably Japan and California—are generally conceded by scientists to be more subject to earthquakes than others. In the beginning of this year not only these areas, but also the New England-New York-Quebec area, and such areas as New Madrid, Missouri, show, on a basis of mathematics, that the expectancy of loss and destruction through earthquake, is the highest this year of any in history. Where *prediction* is consistently quite impossible, *expectancy* can be determined, based on observed, recorded and attested fact, and upon the basic laws and mathematics. And for some years past the Foundation has made the northeastern portion of the United States and adjacent territories the particular object of its study.

An earthquake has been felt in the New England-New York-Quebec area on an average of more than once a year since the Pilgrims landed. A recurrence today of the great Boston earthquake of 1755, or the earthquakes of 1663, 1727, or 1744 might, under the present existing conditions of our cities, cause appalling disaster. It is interesting to remember that on November 26, 1755, John Winthrop, Holliston Professor of Mathematics and Philosophy at Harvard College, turned aside from his regular course to make a speech, which subsequently became famous, to the student body, upon the subject of the great earthquake which had taken place November 18, at 4:15 in the morning, with a second, smaller shock an hour and a quarter afterward and a third on the Saturday evening following.

The professor concluded his lecture by pointing out to the students that the event had been "a mix'd state; in which there is such a variety of purposes, natural as well as moral, in prosecution at the same time, that there may be nothing, perhaps, in the material world, that is simply and absolutely evil; nothing, but what, under the direction of infinite wisdom, power and beneficence, is, in some or other of its consequences, productive of an overbalance of good," and he added that some wells near his dwelling had had the quality of their waters much improved since the earthquake.

***Small Temblors Have Recently Been Recorded***

If, in 1926, the New Madrid earthquake of 1811 should be recurrent, fuel supplies, especially of oil, would be cut off from the eastern coast cities with consequent increase of fire, health and life hazard.

Throughout the history of earthquake records which, for almost a century, have been kept by competent men observing with increasing scientific accuracy, there is to be found confirmation of the fact that earthquakes often come in trains or series. New England has been experiencing shocks for a year. Beginning with July 14, 1924, there have been twenty-one significant shocks, affecting areas in the United States and Canada inhabited by more than one-fourth the population of the two countries. Certain of these have occurred in districts long believed not subject to quakes.

Expectancy of earthquakes in New England is based on past history, and observed, recorded and tested facts. Long intervals of repose and little seismic action lull folk into believing an area immune to earthquake shock. Ultimately, no doubt, science may discover signs to herald accurately the approach of earthquakes, but, in the meantime, as Professor Woodward, of Harvard, has said, it can only be remembered that as time takes us further away from the epoch of one such event it takes us nearer to the next one in the series. The period of rest or freedom from seismic activity has been between 50 and 170 years.

From 1838 to 1870 approximately 208 earthquakes were recorded, the period of greatest activity having come in the middle of the 18th Century.

The first earthquake in the vicinity of Boston, of which there is record, occurred June 1, 1638, and was accompanied by a loud noise. In January, 1663, there was a severe earthquake on the St. Lawrence River which did considerable damage in New England. In Boston, at the same time, dishes fell from shelves and chimneys were broken. In 1727 a severe earthquake, the records of which are especially extensive, occurred in Lynn and Newbury. Chimneys and stone fences were thrown down, the earth opened and threw out hundreds of tons of earth and there was a loud, roaring noise.

***Boston's Greatest Quake Occurred in Colonial Days***

Boston's greatest earthquake occurred November 18, 1755. In Scituate, Pembroke, and Lancaster chasms were opened in the earth and in Boston chimneys were thrown down, walls and masonry were shattered and some of the streets were strewn with bricks.

It is now more than 170 years since the last severe shock in Boston, and the period has been one of comparative quiet. But the study of other regions points to the belief that this period of quiet may have ended and the period of greater seismic activity be at hand.

The main zones of origin from which earthquakes felt in Boston have come are: One in the St. Lawrence River; one in the Bay of Fundy, running down into Massachusetts Bay; one up Long Island Sound, and one in the Connecticut River. Several earthquakes, of comparative unimportance in themselves it is true, but important as indicating the dawn of a new seismic period, have occurred in the past year. All of the "faults" have been in evidence, the earthquake at Hartford in November, 1925, having come from the Connecticut zones of origin.

Boston is critically placed in the event of serious earthquake. When the walls of the Pickwick Club fell in July, and there was darkness and thunder and confusion, the natural inference was that there had been an earthquake. Old maps of Boston show how close the foundations of the buildings were to the division between the old, solid rock and the newer, looser fill; and that disaster and others like it were eloquent reminders to the public, to engineers and contractors of a part of the text of the Engineering-Economics Foundation, *that what is below the ground is equally important with what is above it and that the condition of the earth in any particular site must be studied quite as critically as the stress and strain of beams and rafters.*

The Foundation was established to direct public thought to the relation of men's life and death to emergency and to reduce hazard from emergency by intelligent foresight and intensive preparedness.

It has been calculated that 75 per cent of property loss and individual suffering in Tokio might have been averted by adequate preparation and public intelligence. It is well recognized that shocks are more destructive when they occur on filled or made land than on natural land. Downtown Boston, for instance, consists of 66½ per cent of original and 33½ per cent of artificial land. In this downtown area, of which one-half is of the type least constituted to withstand shock, 200,000 persons sleep and 600,000 work.

The 1755 shock, which was comparable in intensity to the worst shock New England may reasonably expect to experience within the next 100 years, was far less destructive then than it would be now, but the population then was 15,163 as against 783,166 today. The population in 1755 was homogeneous, an English-speaking population. Today there is present the very important element of a large foreign population, often variable temperamentally and not amenable to the influences of ready education in such a subject. The problem here is solvable by man. It should be solved.

Excepting for one narrow strip, Boston's solid ground is entirely surrounded by made land. There is the possibility that if no buildings were shaken down on the firm land by a shock, there might be still a serious danger of fire, enhanced in the case of broken water mains, and attendant high wind. There are many oil storage plants on the fringe of Boston Harbor. Yokohama, under like conditions three years ago, proved a death trap. The fact that the north and south terminals are located on made land and that with one exception, Washington street, the streets leading out of the city to the westward are, likewise, on made land is not put forth by the research men to cause unwarranted fear, but through conviction that such knowledge, generally held by a thinking, self-determining public in advance of any emergency, makes it possible for the public to coöperate with the authorities in securing measures to enhance the protection that must be the city's strength in time of need.

***Dangers That Are Likely to Be Encountered***

Facts like these are considered: that egress from the city by means of bridges crossing the Charles River is made hazardous by clogging with water travel, and that the presence of burning oil on the surface of the water might render escape over as well as on the water impossible. These are details to be considered in the matter of how men lose under quake conditions, and are set forth to emphasize the depth of public interest lying in careful investigation of methods of counteracting earthquake hazard upon the principle that 75 per cent of all destruction, both of lives and property, can be prevented.

It becomes not only a matter of civic duty for those having studied earthquakes and their hazards to pass on their knowledge to the public but it is a matter of civic duty that every citizen shall give all assistance, based on the clear understanding acquired of the emergency possibilities with which he has fortified himself, to the furtherance of understanding plan and action for protection, and the financing of all other forms of protection without which a city in time of earthquake is helpless. Hysteria comes to the uneducated in time of earthquake.

Dr. Godfrey points to the plan of information and instruction to its superintendents and foremen of the Boston Consolidated Gas Company as an admirable example of procedure to which an organization can be sanely, efficiently versed in anticipation of earthquake emergency. In 90 per cent of earthquakes, damage is done to water and gas mains. In 10 per cent there is no damage. In the Santa Barbara quakes the gas mains were damaged. In the Kingston, Jamaica, quake—a severe earthquake—no serious damage was done to gas or water mains.

The men in charge of the various stations of the Boston Consolidated Gas Company are instructed that in the event of shock, the man on watch is to go at once to the pressure gauge showing the pressure which could only be caused by a broken main. The valves controlling the gas supply in the stations are to be shut off immediately. If, however, there is no drop in pressure, valves are not to be closed. This program which may seem comparatively simple within itself, but in which, variously, results of the most enormous relief or appalling disaster may lie, has been made with due regard for flexibility, and is applicable regionally or throughout the entire area fed by the company, dictated according to the severity of the disturbance and its distribution.

***When Quakes Are Most Dangerous***

The Foundation finds that a continuance of such earthquakes as occurred in the New England-New York-Quebec area January 7, February 28, and October 9, 1925, and their coming under common conditions of low resistance, would cause serious loss and possibly serious panic. By conditions of low resistance is meant this: When they come in company with high winds, as nearly half the earthquakes in the present spasm have; occur in the fill or soft land which makes up so much of our cities; attack poorly built and settling structures of which there are many, and take place in winter as most earthquakes in this territory do.

Both from the viewpoint of historic earthquakes and of the possibilities shown by the quakes of 1925, expectancy of earthquake loss and destruction is the greatest that has existed here.

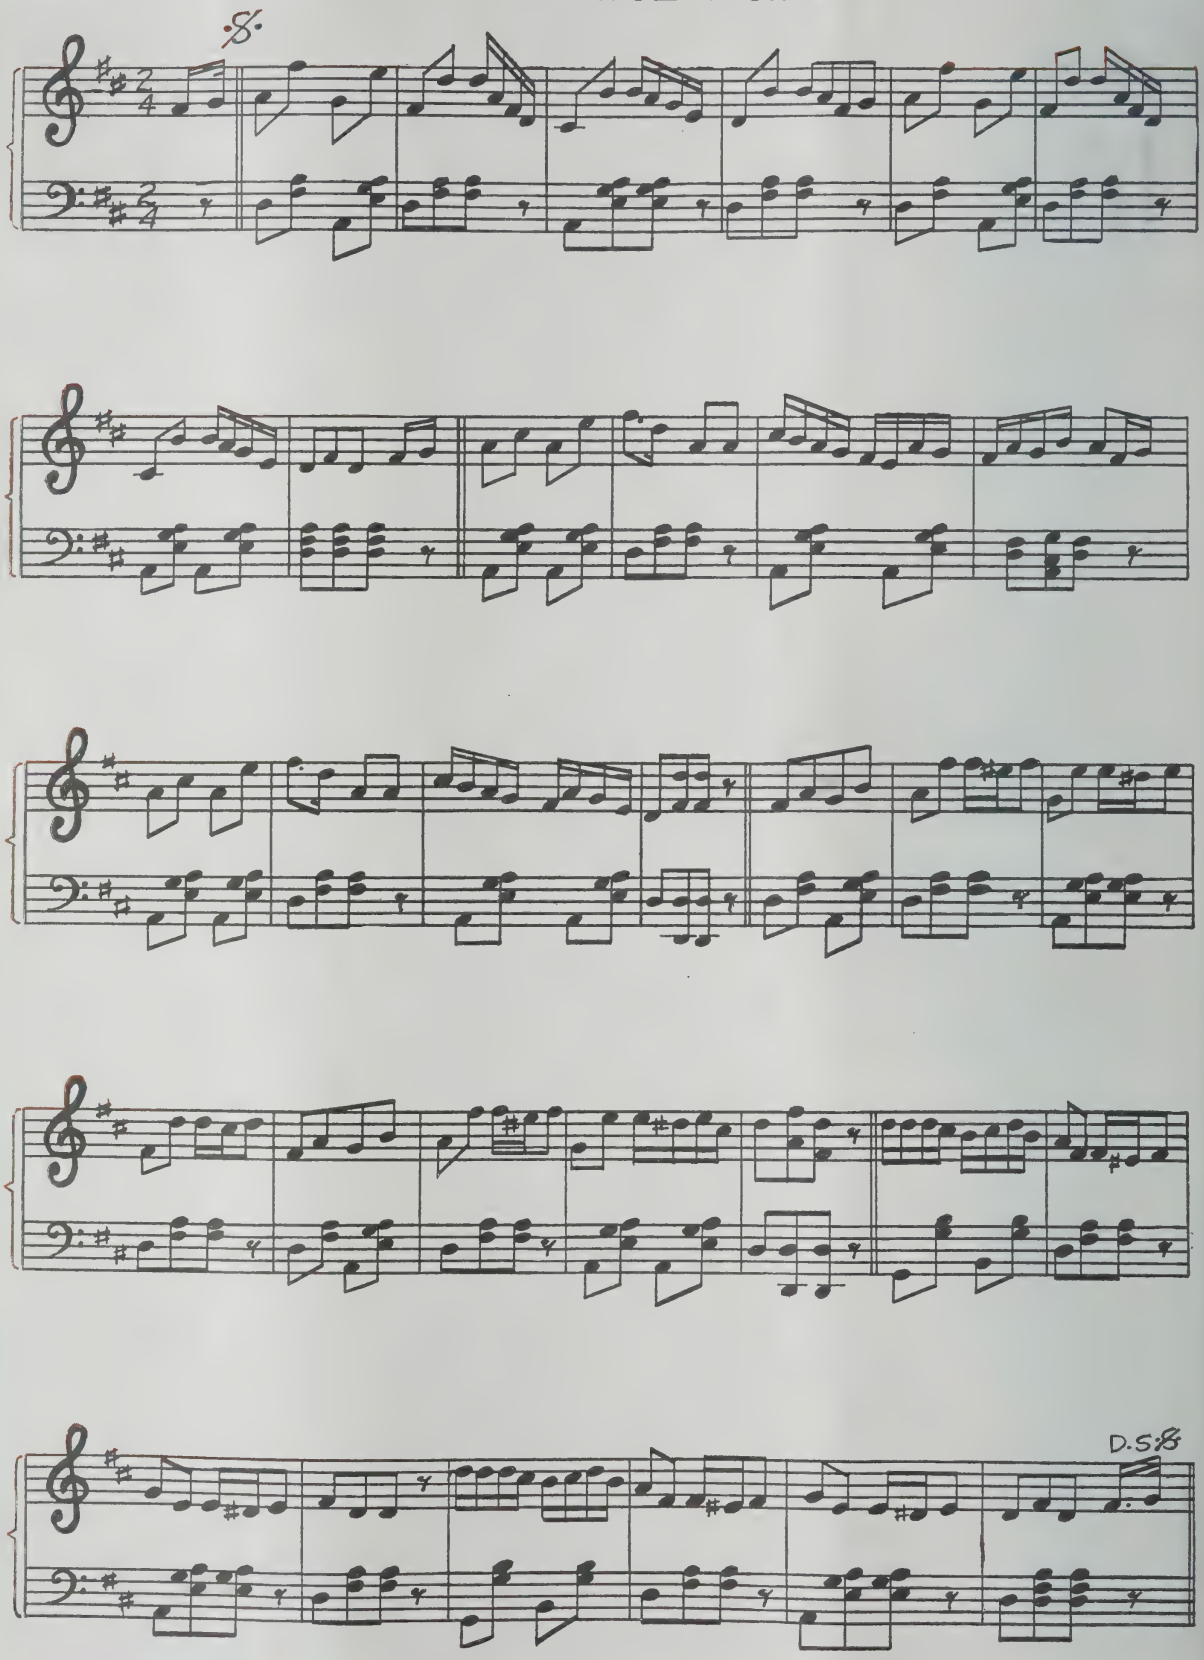
This is an area where, happily, a high degree of protection can be given, a condition which does not obtain in some other lands. The problems of protecting the New England section against the strongest earthquake it has known are solvable. At least 75 per cent of protection is obtainable now and 90 per cent is in sight. But the Foundation knows that the problems of protection must be solved before the protection can be obtained. The records of the past do not show that obtaining protection places a heavy burden of expenditure on the community or on the individual. Advance knowledge concerning protection in earthquake hazard by reducing the costly factors of ignorance reduces the necessary cost of protection, both in money and in time. The demand for such protection against quake destruction is a natural, human demand that all civilized human beings make. It is as natural to seek protection against the effect of earth movements as it is to seek shelter against the more casual elements of rain or snow.

***Risk Element Is Reduced by Knowledge***

An intense fear is quite natural among people suddenly confronted with their first experience in an earthquake shock, but that fear can be appreciably diminished or, indeed, practically dissipated by a foresighted knowledge of the conditions to be expected and the means whereby the individual may secure for himself and for others practical safety. In general the Foundation repeatedly emphasizes certain fundamental practical measures. For instance, it sets forth that rushing out into the open, where the danger of being struck by falling objects is heightened, is foolish, and that to invite safety is to stand in a doorway between rooms in the interior of a building for the fifteen or twenty seconds after which the worst shock commonly passes. Experience points out that buildings of wood, stone, brick or concrete, properly constructed and founded on solid terrain, will commonly withstand shock such as is likely to occur in this neighborhood.

In order that men may take intelligent action in time of earthquake hazard and shock, it is necessary that they shall have heard stated the specific problems with which they may be faced, in advance of emergency, as well as the solution of those problems. Every effective act of protection against earthquake shock depends upon prior development of scientific knowledge of the means of protection.

Safety for the community as a whole is vested in those who are willing to learn and who, having learned, can act wisely on the basis of knowledge.



For those who quite naturally wonder how the circulation of information can be successfully guarded against the influence of the alarmist or of inaccuracy, it must be said that the Engineering-Economics Foundation, having developed the method for determining *expectancy* (not *prediction*) and for using that work of expectancy as the basis of provision of sound insurance under present conditions of emergency, has, for a considerable period, been the original source of all information sent out by the Associated Press, the Canadian Press, the London *Times*, the New York *Times*, the *World*, and *Herald Tribune*, the Boston News Bureau and numerous other avenues of public information accustomed to commanding only authoritative communications. Besides having some sixty post-graduate students this year, the Foundation has completed the organization of instruction for fifteen hospital units and fifteen corporation units, as well as instructing numerous public servants and representatives of the vast network of public health and security, fire insurance companies and business and professional men. It has rendered assistance, with respect to public health service, to officers of the United States War Department, of the Dominion of Canada, of the United States Geological Survey, the United States Weather Bureau and numerous states throughout the country.

***Foundation Does Great Service by Protective Action***

The Engineering-Economics Foundation, then, is engaged in the great task of forestalling death, panic and destruction in time of emergency by protective action. It recognizes that only through the performance of all the functions herein enumerated can its purpose be secured, effective protection against the destruction and loss that earthquake brings. Its problems are problems of life and death, not of property. It is interested in problems of property because by property is life maintained.

# Heel and Toe Polka

MM 100

# A Dance a Week

## The Steps of the Polka

### First Danced in the United States in 1844

THE POLKA STEP

It is generally supposed that a slight hop preceded the first step of the dance, like the grace note in music. Some authors claim that there is no hopping in the dance, although the character of the dance is staccato. However, the movement appears much better when begun with a hop, especially if executed by children, they being lighter and more active than adults.

In teaching the polka, the writer has not encouraged the hop in adult classes, but has always taught it to children.

THE DANCE

Metronome 100. For convenience count 4 to the measure. Waltz position.

Raise and lower (or hop) on right heel (a preparation), raise other foot side of ankle, (&);
Slide left to side, (1);
Close right to left, (2);
Step to side, (3); Rest, (4) 1 bar
Repeat right always starting with the raise or hop thus:
Raise and lower on left heel, raise other foot side of ankle, (&);
Slide right to side, (1);
Close left to right, (2);
Step right to side, (3);
Rest, (4) .....1 bar
Repeat all ..... 2 bars

"Good Morning" is the new Ford book on the Old American Dances. 75 cents a copy. Send orders to Dearborn Publishing Company, Dearborn, Michigan.

Starting the dance.
Heel extended, toe raised.

Second movement of the feet.
Toe resting lightly on the floor, heel raised.

*From photographs posed by Mr. and Mrs. Benjamin Lovett, Masters of Dancing.*

HEEL AND TOE POLKA

THE DANCE—I.

Metronome 100. Waltz position. For convenience count 4 to the measure.

Place left heel to side, toe raised, (1-2);
Place left toe on floor, back of right, heel raised, (3-4) .... 1 bar
Raise and lower on right heel (or hop), (and); Slide left to side, (1);
Close right to left, (2);
Step left to side, (3);
Rest (turning half to right), (4) 1 bar
Repeat reverted thus:—
Place right heel to side, toe raised, (1-2);
Place right toe on floor back of left, (3-4).....1 bar
Raise and lower on left heel (or hop), (and); Slide right to side, (1);
Close left to right, (2);
Step right to side, (3);
Rest (turning half to right), (4) 1 bar
Repeat.....8 bars.

II.

8 Polka steps turning..... 8 bars
16 bars

If used in an open position, that is, standing at side of partner, nearest hand joined, the heel of the advanced foot is placed directly forward on count 1 (the angle of the body slightly backward). On the second count, the toe is brought back, resting lightly upon the floor (the angle of the body is slightly forward). Polka forward, count 3 and 4. Repeat with the other foot.

# One Reason Why Your Purse Is Light

(*Continued from page 7*)

kind, as on farms, and to a lesser degree, but nevertheless management. Not the value of a pin comes either from the largest or the smallest unused properties. Management and labor produce everything. A tree on an abandoned farm will grow, but it is of no value for lumber or firewood until someone cuts it down and prepares it for its designated service.

So it all comes to this: Property pays no taxes. Labor and management pay everything that is paid or can be paid. And management is but the name of a higher form of labor. It is all labor, whether with the head or the hand or both. Therefore, no one who labors at anything should fail to be interested in the subject of taxation, regardless of whether he pays his taxes directly or indirectly.

***None of Us Can Know How Many Taxes We Pay***

None of us knows—none of us can know—how many taxes we pay. The nickel that buys a ride on a street car (wherever rides can still be bought for a nickel) represents part of the taxes that everybody has paid who has contributed to the possibility of taking the ride. It represents a part of the tax on the land that yielded the ore out of which the car wheels and other metallic parts were made; a part of the tax on the steamship or railroad that brought them to the smelter; a part of the tax on the smelter itself; a part of the income taxes of the manufacturers of everything that went into the car; a part of the real estate taxes in every city and town in which the various parts of the car underwent some preliminary manufacturing process. All of these taxes are wrapped up in the cost of the car when it is sold to the operating company and collected from those who ride in it. The sum collected from each nickel is not much, but the sum represented by taxes in each nickel we spend amounts to a considerable percentage of small incomes. And most incomes are small—too small, perhaps, to pay direct income tax, but large enough to shoulder a part of all the others.

***Direct Taxation Would Be an Eye Opener***

*It would be a great thing for our education if, for a few years, all taxes were levied directly and on no other principle than the present one that the Government needs the money.*

Women, having the right to vote, would be much interested in the political education that would come to them if no woman could have her hair bobbed, marcelled, permanently waved, or even washed unless on each occasion she bought a license from the Government for, let us say, $2.

Men would be more interested in taxation if they had to pay 25 cents for a license to light their pipe, 50 cents to smoke cigars, $2 for each trip of less than a day taken in an automobile, and $5 for dining outside the family residence. If a good, active man were to set himself about it, he could observe thousands of things that men and women do and tax each of them according both to the inability of the victim to escape the tax and his financial ability to pay it.

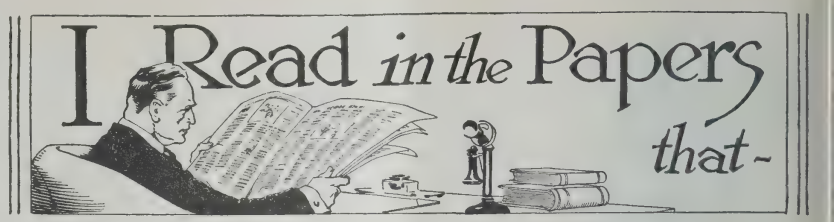
***When Women Would Upset the Apple Cart***

A little careful estimating would produce a national aggregate that would enable our national legislators to continue to find jobs

at public expense for such of their worthy constituents as have political influence, to dredge and dust dry creeks for the purposes of domestic navigation, to erect more and worse public buildings equipped from top to bottom with the most costly things that contractors of easy conscience can supply and, in all other ways, continue to waste money as only the Government, apparently, knows how to waste it.

But the thing would not last very long because the women would overturn the apple cart. We have to give the women credit. Convince the average woman that she is being bunked and she will raise more row over 20 cents than the ordinary man would over $20.

Many New Yorkers were amused last winter to hear a woman broadcasting over a radio station the fact that on a recent journey from Washington to New York the heat in the Pullman car she occupied had been turned off and she had suffered from cold. She said she had asked the conductor to turn on the heat and he said he couldn't. She warned him that if he did not turn it on she would go to a broadcasting station in New York in which she had friends and broadcast the whole terrible truth to the country—that passengers on his train were permitted to suffer from cold.



Apparently the conductor made up his mind that trouble was somewhere camping on his trail, because he turned on the heat. But by this time the woman was mad from her hosiery to her millinery and she made up her mind to do the broadcasting anyway. And, she did plenty of it. Why the management permitted her to land on the railroad and its officials as she did, calling each by name, was and is a mystery. Whether she was a very beautiful lady or her husband had a mortgage on the road was not revealed, but she certainly said what she had to say without leaving anything to the imagination. She had been made uncomfortable and she wanted to make those whom she held responsible equally miserable. A man would have grumbled a little and said nothing.

***The Waste That Makes Big Taxes Necessary***

If all taxes were paid directly, everybody would have an interest, not only in taxes but in wasteful expenditures upon the part of the Government. We shall never do anything so sensible or so effective as to make all taxes as direct and as burdensome as possible, but it would be a quick way to cause some persons to think who never yet have thought about such matters.

Nobody objects to the Government having what money it needs to do the things we want done. Everybody is willing to pay his share toward such a fund. What everybody should object to is the waste that makes exorbitant taxes necessary to balance income with outgo. Our great misfortune is that so small a percentage of the population objects.

Those who pay no direct taxes think they are not concerned. As a matter of fact they should be more concerned than anybody else, because the taxes they pay indirectly confiscate a greater percentage of their income than is suffered by the rich. And there is the further fact to consider that a great volume of wealth cannot be collected by the Government and wasted without hurting everybody in the country. It hurts everybody in many ways, chief of which is that it enables large numbers to live without useful labor. Men and women who are doing nothing useful and getting paid for it are just so many tight brakes on progress toward easier living conditions for everybody.

a number of great men have issued the following letter about another great man who passed unrecognized in his day.

On August 12, 1927, 100 years will have passed since there died, in a small room off the Strand, an obscure engraver, the inventor of designs for Blair's "Grave," and also known as the writer of songs for children admired by Lamb, Coleridge, and Wordsworth.

This strange genius, William Blake, we see at one time without food on his table, at another buying with his last shilling a camel's hair brush. Today, with the irony of fate, his works command the highest prices in two hemispheres, while the verses for which he despaired of any readers now even appear in advertisements in our streets and are sung at national gatherings.

For Blake, be he archangel or eccentric, is irresistible. For three generations critics and scholars have attempted in vain to place him and to produce his best in final form. As his living genius ever broke out in some new phase, startling the mind by the splendor and daring of a poetic design, the terse profundity of an epigram, the sweetness of a lyric, so, even a century after his death, he still disturbs all previous judgments by yielding new or forgotten beauties and meanings to research and scholarship, and there seems no end to the stream of careful and luxurious editions of his works and of exquisite reproductions of his designs.

The Dean and Chapter having given their consent to a memorial in the Cathedral of St. Paul, the city Blake so loved and castigated will be the first to treasure the record of her prophet. Shakespeare rests by his Avon, Wordsworth among his lakes and fells, and Blake, whose body has long since returned to earth in an unknown common grave in Bunhill Fields, will be honored by the city whose darkness he labored to redeem by his vision of "Jerusalem."

ɾ ɾ ɾ

prominent raw silk merchants of Japan admit that the manufacture of rayon or artificial silk is gaining such proportions that the revenue from silk production in Japan is materially affected.

N. Y. Tagura, who finances about one-quarter of the silk that leaves Japan every year, stated that plans are now being formulated for the establishing of a large rayon plant near Hakadoti where wood fiber from the Sakhalien Islands will be used, but he fears that it will not be long before real silk will be a thing of the past.

"The world," said Mr. Tagura, "wants many cheap garments, instead of a few of quality—a condition that exists in every country, consequently sericulture will soon give place even in the Orient to fiber silk manufacture."

ɾ ɾ ɾ

Cyril Maude, the English actor, made the following statement before retiring from the stage recently to return to his home in Dover:

"The growing tendency in American playwriting is toward filth, and it should be strangled in its all too sturdy infancy.

"My chief regret is that probably I shall never visit this country again. Plays could be made strong and vital without the gross appeal of certain works now making their millions."

The actor has spent forty-two of his sixty-four years on the stage.

ɾ ɾ ɾ

that Father McClorey, a Jesuit priest, professor of English and Greek at the University of Detroit, had this to say about the temporal power of the Pope:

"The temporal power of the Pope was not a part of the institution of Christ. It was an acquisition which the popes thought, wisely or unwisely, would facilitate their government of the church.

"Whether the Pope looks for the restoration of the Papal States, not by arms but by a belated recognition of his just claims, I do not know. But this I do know; that an American friend of mine, Fr. Macksey, a former Jesuit professor in the Gregorian University of Rome, taught there in the shadow of the Vatican, without disapprobation, that temporal power is not desirable.

"Americans, in any event, would certainly not be subject to the temporal power of a Pope," said Fr. McClorey. "Italy as a civil government would mean nothing more to us than any other government, and if the Pope should war with America, undoubtedly we would take up arms against him, as did the French and other Europeans in past centuries. We have an episcopate full of the spirit of American independence. Most of them are of the Irish race, which always has been tenacious of liberty.

"These ecclesiastics would resent any aggression on the part of the Pope. Also, may I ask, do these people really look upon a helpless old man as a necromancer who could conquer the American nation by the wave of a mystic wand, or by the secret influence of black magic and wizard spells, or a papal bull, a rosary, a crucifix, or some other spiritual amulet of the kind?"

ɾ ɾ ɾ

the international outlook of the Jews, as regards members of their own race, was strikingly illustrated at the annual meeting of the Jewish Publication Society in Philadelphia recently. Some significant statements were made by Dr. Jonah B. Wise, noted rabbi.

"The center of gravity of Jewish life is shifting toward America," Rabbi Wise declared. "While no one part of Israel will claim a preponderance of influence it must be admitted that the Jewish future is tremendously involved in the fortunes of the American wing. *A generation of heavy immigration has added in numbers sufficient to make the Jewry of the United States equal in size, if not larger, than that of any one political unit.* Sharing in the cultural and economic advantages of America, we find ourselves anxious and willing to help our distressed brethren in other lands and are faced also with the necessity for shaping our own affairs so as to do justice to our own problems."

# Woodrow Wilson—Not Too Good and Not Too Wise

(*Continued from page 6*)

ured by the standards of a man of the world, Mr. Wilson said: "Surely you would not thrust such boys on a hard cold business world. You know," he added, with amusement, "it takes a hundred years to make an oak tree out of an acorn, but it is possible to produce a squash in one season."

Another interesting demonstration occurred in connection with the appointment of a Secretary of the Interior in the first Cabinet. The incumbent in the Taft Cabinet was Walter L. Fisher, of Chicago, a great conservationist. At that time Franklin K. Lane, of California, was a member of the Interstate Commerce Commission. He was a Westerner, with broad knowledge and very definite views concerning the problems of irrigation, reclamation, forestation, conservation of natural resources and other subjects with which the Interior Department had to deal. Fisher had been made head of the Interior Department following the public land scandals in the Taft Administration. Men like Lane, an independent in politics, were fearful that a backward step might be taken. Lane and Fisher were also warm personal friends.

Therefore Lane wrote a letter to President-elect Wilson, expressing in detail the problems of the Interior Department and urging the retention of Fisher as Secretary. When Mr. Wilson received it at Princeton he read it carefully and finally said to himself:

"The man that wrote that letter is the man for Secretary of the Interior."

Accordingly, Lane was asked to accept the post. He and Woodrow Wilson had never met and did not meet until the new President came to Washington to be inaugurated on March 4.

The serious side of Woodrow Wilson found its outlet and reaction in the appreciation of a humorous story. It was for this reason that he welcomed visits of men like Senator Ollie James and Senator "Billy" Hughes, of New Jersey, and did not relish the mentally heavy and serious type.

On the other hand he fully realized the dignity that should go with the office of President. This was well illustrated by the matter of his first inauguration. Early in January, 1913, when Mr. Wilson was President-elect, he wrote to the chairman of the inaugural committee, abolishing the ancient, traditional inaugural ball, which had been a famous institution for more than a century. The inaugural ball had been used in the past to raise money with which to pay the expense of the inauguration. Great crowds came to Washington. Hotels and restaurants raised prices. Merchants reaped a harvest. An orgy of profiteering reigned for a month or six weeks.

Admiral Cary Grayson.

President and Mrs. Wilson and party, photographed in 1916, as they were leaving the Daughters of the American Revolution Hall.

(C) Harris & Ewing

This was the slant Mr. Wilson had. It all struck the direct-thinking, serious-minded President-elect as a commercialization of the Presidency of the United States and a social aggrandizement of that great office, toward which he had a feeling bordering on the sacred. He was irritated at the idea that he and the members of his family should be the main attraction in such a display.

At the time he was thinking such thoughts a friend who was calling on him at Princeton happened to make the following remark:

"By the way, Governor, I recently wrote to a small Washington hotel for a room on March 3 and 4 and was told it would cost me $70."

Mr. Wilson asked to see the letter quoting such a rate. He read it, and thus received first-hand information of the system then in operation. The rate for the room was $10 a day, but the guest was compelled to take the room for a week, or rather to pay for it for a week, whether he had it one day or seven. In the larger hotels the rates were as high as $20 a day, with a seven-day minimum. This was the last straw. Mr. Wilson abolished the inaugural ball—and Washington stormed with indignation.

Throughout his career Mr. Wilson strove conscientiously against being hurt by foes and "loving friends." He did not mind so much being hurt, personally, but he was ever anxious that his usefulness to the world should not be crippled. He was especially guarded against the danger of being made less useful by "loving friends"—a constant menace to all public officials.

"If a President makes an intimate, personal friend of any one," Mr. Wilson remarked early in his Presidency, "it isn't long before that friend asks him to do something. Usually it is something he ought not to do. If the President does it he has committed a wrong and if he doesn't do it he has hurt a friend. If he is to maintain his freedom, therefore, and devote himself completely to his business, a President must live a life of practical isolation. He can have very few friends during his term of office."

Wilson, the Virginia gentleman, looked upon his home as something exempt from the political arena and to be protected at all hazards. For years the White House had been regarded as a sort of semi-public institution. Mr. Wilson did not so regard it. To him it was home, and into its wholesome precincts he would introduce nobody because of any materialistic reason.

In the entire eight years of the Wilson Presidency, no Senator or Representative, no political leader, no influential citizen was invited to lunch, to tea, or to dinner at the White House for the purpose of affecting his attitude on any question. Hardly any were invited at all. If they came, it was as old friends on a strictly personal basis.

When a guest once entered the portal of that home he was taken into the very heart of the family circle. There was no reserve, no injunctions of secrecy, no lowering of the voice, no use of the words "confidential," or "not for repetition."

Friends privileged to sit at the Wilson table and spend an informal evening about the fire in the private, upstairs library were often shocked to breathlessness at the complete frankness of discussion. The bars were down. The President unreservedly gave his friend, who had broken his bread and eaten his salt, his complete confidence.

His frank expressions concerning the affairs and the people of the hour were nothing short of amazing.

It has sometimes been said that Wilson, in later years, wished that men would approach him with the same *camaraderie* that he had been accustomed to in his college days.

Like some of his predecessors in office, he found it very difficult to act humanly when those about him would not act likewise, in his presence. Often he expressed a longing to have people treat him as if he were not President and, if necessary, act impulsively in his presence. He sought to do this even when in the White House until he found that people so misunderstood his acts that, as he once said, he must cease to be human. This remark was made after he had attended a theater in Washington where there was a splendid performance of a play written by Booth Tarkington, one of Wilson's former students at Princeton. In the cast was a very young actress who had given a signal performance in her part. Her efforts so aroused the enthusiasm of Mr. Wilson that he sat down and wrote her an applauding note of encouragement. Somehow this reached the press agent, and the next thing Woodrow Wilson knew it thrust itself at him from the pages of the press. As he saw to what ends commercial use was made of his desire to encourage others he remarked to one of his intimates, "Well, people just won't let a President be human."

*The President's Desire to Be Human*

So strong was this desire to be just human that he got a boyish thrill out of slipping away from the Secret Service men whose duty it is never to let the President leave the White House unescorted. Late one afternoon, after a trying day's work, stuffing a soft felt hat inside his coat, he turned with a broad grin to one of his office assistants and said, "Watch me get out." As he passed through the door he shook his fist at Mays, the faithful doorman, and said, "Mays, you tell on me and you lose your job." Upon discovering that the President had evaded their ever-watchful eye, the Secret Service men spread a net over the city of Washington. Where should they find the President but on one of the less fashionable shopping streets, in a five and ten cent store, surrounded by a crowd of dirty-faced youngsters, with the President attempting to buy out the candy counter for them.

A bit of Scottish humor was displayed by Mr. Wilson in the promotion of Dr. Cary Grayson, his official physician, to be an admiral. Grayson had been in the Navy several years. President Wilson found him in the White House, where he had been physician to Mr. Taft. Discovering him to be a fellow Virginian and a Democrat, and taking an immediate liking to him, Mr. Wilson retained him. Three years later a bill was passed creating four new admirals, of whom two could be in the medical corps. Grayson then held the rank of lieutenant commander.

*Grayson Was Appointed an Admiral*

The Presidential election of 1916 had just been held. On election night, when it was thought Hughes had beaten Wilson, a celebration was held at the Army and Navy Club in Washington. The Navy was especially jubilant. Many Navy officers hated Secretary Daniels and they figured that, with Wilson beaten, they would get rid of Daniels on the fourth of the next March. It was in the pre-Volstead days, so the celebration was more or less wet. Along about midnight some of the Navy people opened up and revealed the innermost secrets of their hearts as to Daniels and, to some extent, as to Wilson. All was quiet along the Potomac the next day, when it was discovered that Wilson had been elected after all, but the news of what had happened the night before reached the President's ears. He said nothing, but a few days later he told Grayson he was going to appoint him an admiral.

"I don't think you should do it, Mr. President," Grayson said to him. "It would jump me over a lot of fellows' heads and cause criticism. I wouldn't mind it, but they would criticize you as they did Roosevelt for jumping Leonard Wood to a general. I wouldn't like to think you were being blamed for doing something for me."

"Well, I'm going to appoint you, anyway," Mr. Wilson replied. "In the first place you are qualified. In the second place I want to do something for you to show my appreciation of all that you have done for me . . . "

Then he paused and smiled. A grin spread over his face and his eyes lighted up with fun.

"And besides," he added, "I'm not averse to drawing off a little of that hot Navy blood that was running so high at the Army and Navy Club on election night."

The appointment was made. The Navy howled. Mr. Wilson chuckled to himself and stood pat. There were rumors of opposition to confirmation in the Senate, but nobody could raise any valid objection to Grayson and he became (and still is) an admiral.

*When Wilson Was on the Golf Course*

Mr. Wilson followed the same course in his recreations that he followed in his home, so far as concerned letting "all men count with him but none too much." He seldom played golf with Senators or even Cabinet members. In fact, he rarely played with anybody but Admiral Grayson and, after his second marriage, Mrs. Wilson. Throughout his whole first term he played nearly every afternoon. On rare occasions Colonel House, who did not play, would walk around part of the course with him. The reason for his limiting his golf playing to Dr. Grayson, however, was similar to the reason that he had for not having Senators and others to lunch. He could not make intimates of all and so he made intimates of none.

Mr. Wilson's fun-loving personality was generally in the ascendency on the golf course. He always used the same caddy, and one Secret Service man always followed after him. He laughed, joked, told stories, swung his arms and frequently hummed a happy tune.

One day during the war I was on the Chevy Chase golf course, awaiting my turn, when President Wilson and Admiral Grayson came up. As there was no one ahead of them and they would have been held up for some time if they started at the first tee, they chose to begin at the middle of the course. Upon invitation of the President to join them in their game, I accepted.

*Revivifying Effects of the Game*

At the start off the President seemed to be playing listlessly and indifferently, but about the fourteenth hole his game showed a decided improvement. As he was now going well, I jestingly remarked that I would swap jobs with the President any time if I could play golf every day. He received my jest smilingly and in defense of the fact that he played every day, said that he found no other way to settle his nerves and insure himself a sleep at night. Upon my suggesting that his game was picking up, he answered that it took four or five holes before he could forget the affairs of his office. It was only the battle with the little ball that enabled him to transfer his thoughts from the office to the outdoors. It was noticeable that as his game picked up, his humor and jesting emerged and he laughed, joked and told stories like a care-free man.

Soon after he arrived in Washington, Wilson joined a small club made up mostly of Government employes, whose course was tucked away in the Virginia hills. He paid his full membership fee and dues and would not accept special favors because of his position. Frequently other players would be on the tee waiting to drive off when he arrived. They always asked him to precede them and he always declined. He would accept only such advantages as the rules of the game permitted. Playing a twosome, he would "go through" a foursome if the latter was slow and held him up, but he would not pass another twosome holding its place on the course.

*He Enjoyed Climbing the Hills*

"No, indeed," he would frequently call out, waving his arm to other players. "You have the right of way. Go ahead."

As a result of his punctiliousness the other club members adopted the custom of "losing a ball," and insisting that he act on his right to pass them. In no other way could they give him the advantage.

Later in his term he accepted honorary membership in the Chevy Chase Club, and occasionally played that course. From time to time he visited the other courses around Washington also, but he usually stuck to his own club, where there was a hard, hilly course, with ditches, ravines, woods and other difficult, natural hazards. He enjoyed the physical exertion of climbing the hills and the freedom accorded him by the other members, who let him forget that he was the President of the United States.

IT can not be denied, but by those who would dispute against the sun, that with America, and in America, a new era commences in human affairs. This era is distinguished by free representative governments, by entire religious liberty, by improved systems of national intercourse, by a newly awakened and an unquenchable spirit of free inquiry, and by a diffusion of knowledge through the community, such as has been before altogether unknown and unheard of. America, America, our country, fellow-citizens, our own dear and native land, is inseparably connected, fast bound up, in fortune and by fate, with these great interests. If they fall, we fall with them; if they stand, it will be because we have upholden them.

—*Daniel Webster.*

CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD

FIVE FARMS, comprising seventy-two acres, are still in existence on Manhattan Island.

RECENT EXCAVATIONS in Georgia and Tennessee indicate that the mound builders there had cultural contact with the Aztecs of Mexico and the Mayas of Yucatan.

THE FRENCH PARLIAMENT has forbidden the manufacture of *sucettes*, baby pacifiers, as causing adenoids.

THE ONLY DIRECT Irish Free State export to the Philippine Islands last year was of $128,204 worth of biscuits.

BEFORE BEING RECEIVED into the tribe an Amazon youth must place his arms in hollow bamboos containing a colony of large *tucandeira* ants, whose sting is excessively irritating. If he stands the pain without complaint he is adjudged a man.

WHEN A MOUSE or snail enters a beehive the honeybees will sting it to death and then inclose the body in propolis, a resinous excretion from trees, which virtually embalms it.

"LOBBYGOWS"—those who use hotel lobby chairs without paying for rooms—are being handed cards in many of the leading hotels indicating that their presence is not desired.

BOILED COCOA, CORN and red peppers constituted a favorite drink of the Aztecs.

ALTHOUGH RUSSIA FIGHTS for recognition by other governments, she persists in closing the door to visitors. Only 1,664 persons were permitted to visit Soviet Russia in 1925. Of these 128 were political and diplomatic visitors. Only 113 Americans were admitted.

A BRITISH EXPERT says that women will never become perfect air pilots because they are too fearless. A certain sense of fear of danger makes for carefulness, while fearlessness often makes for carelessness.

WORRY ABOUT OVERWEIGHT sent 225 women suffering from mental disorders to Bellevue Hospital, New York, last year.

THE BARONIAL ESTATES of Sweden are being divided and sold to farm workers in an attempt to stem the tide of emigration to America.

MORE THAN TWO MILLION persons a day, or about two per cent of the entire population of the United States, are unable to attend to their regular duties because of illness. The average time lost for each person is eight working days a year.

DURING THE ANNUAL smelt run in the Sandy River near Portland, Oregon, thousands of people line the banks and dip the tiny fish out with tubs, baskets, bags, and buckets, as well as nets.

THERE ARE 70,770,008 books in the public libraries of the United States.

ONE OF THE FIRST locomotive "headlights" in this country was a car on which a fire was kept burning. This car was pushed ahead of the engine.

THE LARGEST BARREL in the world, capacity 70,950 gallons, has been constructed at El Taville-on-the-Rhine.

"ALTHOUGH THE POWER of British Protestantism is great, it is not unlimited, and ours is the cleansing task of assisting to destroy, within a few years, that religion which has been built up through the centuries."—*Leon Trotsky.*

FRENCH RACE COURSES are undergoing great scandal on account of the doping of the horses and the consequent duping of the bettors.

TWO ASSISTANTS of the Secretary of Labor do nothing but sign his name to routine documents.

RESEARCH WORKERS at Pennsylvania State College have reduced the time for mixing and baking bread to 52 minutes.

WHOLESALE THIEVERY of tombstones is puzzling police at Manila, Philippine Islands.

ALL STRAY chickens, unfortunate enough to be caught, are turned over to the local ministers at Wharton, Texas, by order of the city council.

THE *Phya Thai*, royal palace of Siam, has been turned over to a railroad company by the king and will be converted into a tourist hotel.

FORTY THOUSAND grocers fail in business each year, according to a western trade journal.

MILLIONS OF POUNDS of excess meat were dumped on the English market recently by rival American and British firms, battling for trade supremacy. Prices were cut almost in half.

TRUE AMERICAN INDIAN types exist in Tibet, 6,000 miles from the nearest point of the American continent, according to scientists of the Smithsonian Institution.

A RADIO ANNOUNCER in Chicago was fined $25 under a new ruling dealing with slander by radio.

THE BRITISH PARLIAMENT, in 1833, refused to sanction the building of a railroad in England on the grounds that it would corrupt the morals of the Eton boys by giving them easy access to the dissipations of London.

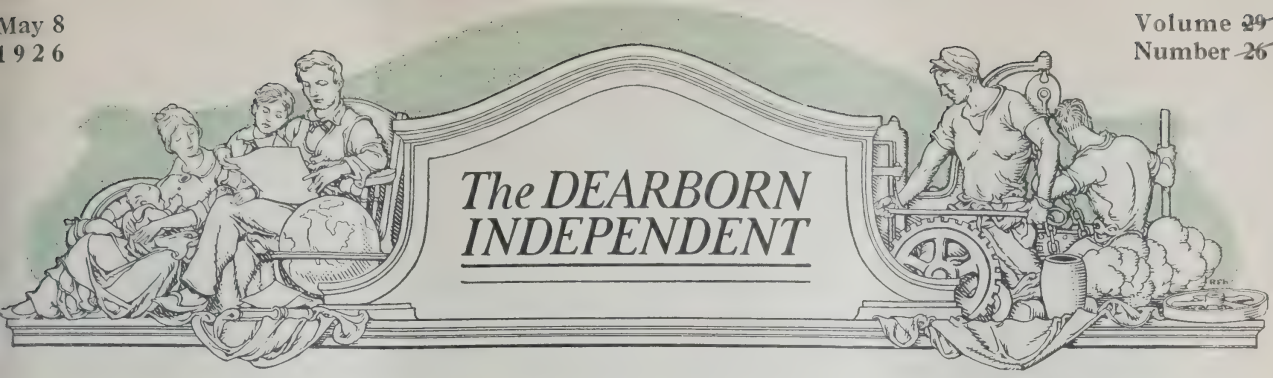
CANDLE MAKING, originating with the homely rushlight, dates back to the early days of the Christian Era.

CHARLIE BIG EYES, an Alaskan Indian, under tribal decree, must pay to his squaw as alimony one bull moose, properly butchered and delivered, ten mink skins, dressed and stretched, five gray fox pelts or one silver pelt, and one hundred full-grown salmon each year.

HIGH-PRESSURE AMERICAN salesmen of fake stocks, who have lately invaded the British Isles and fleeced many persons, are to be deported as undesirable aliens.

A CHINAMAN may at the same time be a Taoist, a Buddhist, and a Confucianist, the three religions being closely allied.

THE INCESSANT "cheep, cheep" of his thousand baby chicks so annoyed a Sand Point, Idaho, man, that he ran away, leaving a note asking his neighbors to care for them.



NINETY WOMEN in the United States have been killed by mobs without trial, since 1889. Thirty-five hundred persons have been lynched in the same period.

JAVA IS ONE of the most distinctly volcanic regions of the world, having fourteen active volcanoes.

JOHN L. SULLIVAN'S diamond studded championship belt, which was presented to him by enthusiastic followers of Boston in 1887, is being scrapped in the Philadelphia mint.

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week discusses the necessity of having all classes of people and all sections of the country prosperous, if the country itself is to be prosperous.

---

Even Europeans distrust the League of Nations! Only when it hales some large and powerful nation before its bar of justice will the League earn the confidence of the world. But no such move is contemplated, even remotely. *The League, as now constituted, is an association of the great powers for the regulation of the conduct of the weaker ones.* The great powers themselves are immune from its decrees. (p. 6)

---

We are slaves to our coats. Hot, cumbersome, often useless, they are become a mark of probity, a sign of respectability. No? Try to enter a dining car without one! Donald Hough writes a delightful story of his attempts to travel, shorn of a coat, in the once wild West. (p. 14)

---

What of the negro? Do his wrongs outweigh his advantages? We have all read more or less about his problem—from the standpoint of the negro. We have sympathized with him in his grievances, have aided him in his struggles. But we have not always studied the other side. Here is the first of a series by a Southern woman, giving in a remarkably clear way the present viewpoint of the South. It deals with the early phases of the negro problem, with slavery, with the Civil War. (p. 3)

---

Great events took place in Portugal in the years before Magellan sailed into unknown seas. The little nation had been acknowledged by the Christian world as supreme in the Orient. Thoughts of empire filled the minds of bold adventurers; the lure of India drew the flower of the country to the conquest. Men were astir to new things, new places. In this atmosphere Magellan moved, dreamed his dreams, laid his plans. (p. 16)

---

A remarkable woodcut is printed in connection with the Magellan story. It is by Paul Honoré, one of the foremost woodblock artists in America, whose previous work in THE DEARBORN INDEPENDENT has attracted wide notice. This cut has such a wealth of color, of detail, that your especial attention is called to it. The departure of Portugal's gallant fleet is pictured.

---

Who is President of France? Chances are five to one you don't know. Why? Because that post, under the Third Republic, is little more than a symbol. The real power reposes in the Premier, but the mercurial French Chamber of Deputies (which controls the destiny of the nation) has caused the downfall of sixty-one Premiers in the past fifty-two years. (p. 5)

---

New Salem was Abraham Lincoln's alma mater. It was in that little log hamlet that he read Blackstone, that he knew Ann Rutledge, that he held his first federal office—postmaster. The village vanished a few years after Lincoln left. For three-quarters of a century its site was almost lost in prairie wasteland; but now its houses and stores have been rebuilt as a memorial to the man who once lived there. William E. Barton, noted Lincoln biographer, tells of its early days, its rebirth. (p. 7)

PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer;
C. B. Longley, Secretary; W. J. Cameron, Editor.

The old New England country store has passed into the limbo of half-forgotten things. In its heyday it was an important feature of Yankee life, as distinctive as the town meeting. It was the news center of the community, the informal debating society. But it had to bow to progress. (p. 8)

---

The tale of *Evangeline* nearly came from the pen of Hawthorne instead of that of Longfellow—so Hawthorne's son, Julian, reveals. The two were firm friends from college days. Hawthorne, poring over old records, came across the sad history of the Acadian lovers. He contemplated a novel based on the theme, but Longfellow was so impressed with it that Hawthorne gladly surrendered it to him. This incident and many others are here related for the first time. (p. 21)

---

Reminiscences about another outstanding literary figure, one of our own day—Gene Stratton Porter—are also contained in this issue. The world knew her as a writer, but not as a woman. This article tells of her courage in the face of adversity, her bravery in the midst of pain. It tells, besides, how she worked for hours and days in swamps and fields, setting out wild flowers, collecting moths. (p. 2)

---

Wilson was ambitious. He never concealed the fact; rather, he gloried in it. He felt it no disgrace to seek honor. "If it be an offense to covet honor, then I am the most offending soul alive." More, he was a dreamer, a practical dreamer. He had a way of making his dreams come true. (p 12)

---

Would you like a year made up of thirteen months? Many plans for calendar reform have been advanced, most of them advocating a thirteen-month year, each month to have twenty-eight days. An interesting article on this subject by Thomas L. Masson will appear in next week's issue.

---

An Iowa physician writes: "I want to express my appreciation for the excellent articles that appear each week in THE DEARBORN INDEPENDENT. The article, 'Two Dozen Ways to Keep Sane,' in the issue of April 17, should be read in 3,000,000 American homes."

## Glimpses of Novelist's Inner Life Revealed in Intimate Talk With Friend

By PERCY H. EPLER

AT FIRST as Gene Stratton Porter slipped into the room that afternoon some years ago in Indiana, I was sorry not to see any "Freckles."

Instead auroras and grays of dawn lent pigment to her own "morning face." It was always sunrise in her face. I was sure she had been born an English lass on account of her color. But her birth was on an Indiana farm in 1868. And to my surprise, she told me of her being a grandmother and how her daughter would soon come from Philadelphia to Fort Wayne, Indiana, to live near her. If Mrs. Porter had been married very young, her kinship to nature had kept her so.

Though that last winter had been a hard one, its afflictions she kept a secret from publishers and public. And the two-story log house across the dock walk beside the lake kept its secrets well also. I have private letters surcharged with this insistence at that time as well as revealing her wonderful inner victories and power to work.

"I thought myself one of the strongest women alive," she confided in me. "I put on breeches and boots for eight hours a day in the swamps, work that few men could stand.

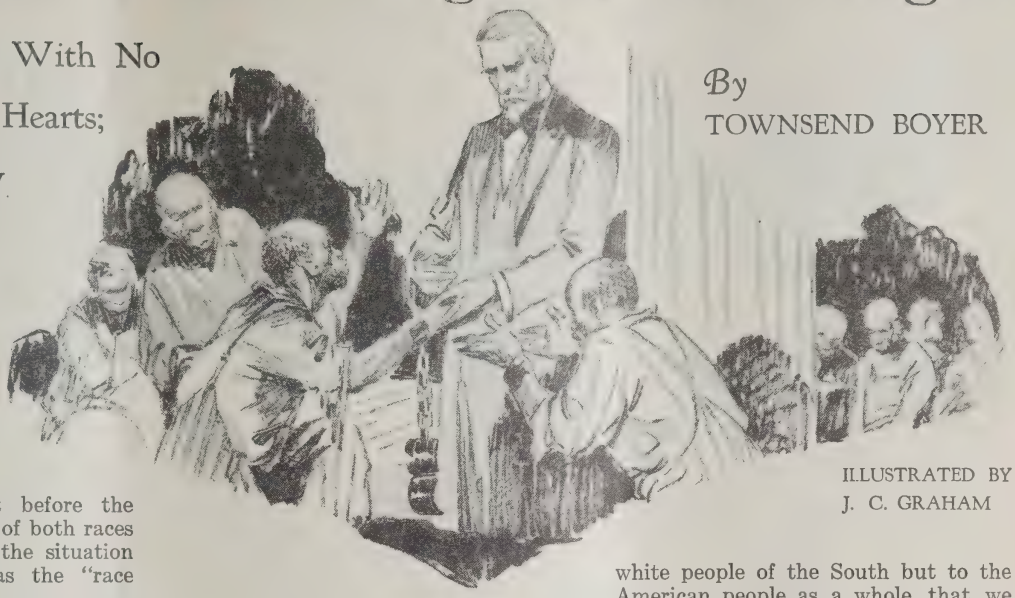
"In that wonderland of 300 lakes, I have," to use her own language to others, "in the last two seasons, set, mostly with my own fingers, the roots of more than ten thousand wild trees, flowers, and ferns. I have trailing arbutus, cardinal flowers, purple gerardia, and painter's cup; fringed gentian from seed; rarest orchids, gerardia, golden slippers, moccasins, showy orchids, and showy slippers. Among these and my trees I live and work, almost never going out into the world."

In three months' space she transplanted into the swamps about her cabin five thousand orchids, trees and shrubs, vines, flowers and ferns with her own hands. She called it "Wild Flower Woods."

"But I was on thin ice, and if I had not been extremely careful I would have gone under altogether," she further confided in me. In midwinter of that last year she told me a confidence I now can tell as she completely recovered. But then she would not let me tell it for the world. "I am more than sorry to tell you that there is small chance of my speaking in public again for a long time—if ever. This year I have been through four severe operations on my jaws and facial bones for bone decay caused by poor dentistry. The last one for impacted teeth in the roof of my mouth interferes with my speech enough to be noticed, and the poison from the infections and the strain of the operations has caused rather severe heart trouble."

All that time she was sitting in bed writing.

She was perfectly restored when I next saw her. She sat in lavender and old lace, in the winter gloaming, reading a proof of a revised nature book for which Doubleday, her publisher, was waiting. I could not dream she had been an invalid. Later in March of that year, she told me she had just undertaken twenty-four nature studies for schoolbooks besides the other work. A million copies of her most popular novels were yet to follow—to say nothing of new ones she was to write.



I was so ignorant of the many family tragedies of her own life. I did not know of the two little sisters who had died of whooping cough and scarlet fever, when she was a little child, or of her brother drowned in Wabash County, Indiana. Many suppose *Laddie* was a character drawn from him.

I was telling her that my little girl, not yet Hoosierized as to climate, and fevered from inoculation, had been ill with a high temperature for weeks, and very homesick. Her eyes filled with tears and she said: "You must be careful, I lost a little sister just from that once." She then ran upstairs, and presently appeared with a copy of *Morning Face*, filled with pictures of her little granddaughter and herself at Limberlost, which we keep indited with her own words today. It was all about birds and swamp bloom.

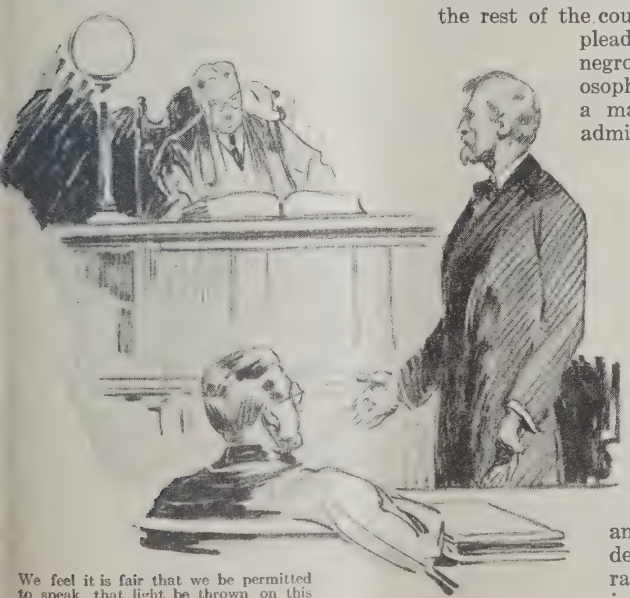
"This is for your daughter," she said, sitting down and writing a personal autograph to my daughter. "I was going to exchange for your *Clara Barton*, one of *my* (Continued on page 26)

# How the South Regards the Negro

## "We Shall Speak With No Malice in Our Hearts; We Aim Merely to Be Frank"

By TOWNSEND BOYER

ILLUSTRATED BY J. C. GRAHAM



SINCE the beginning of the World War, when there was a revival of interest in the American negro comparable only to certain phases of the abolition movement before the Civil War, many persons of both races have expressed views on the situation in the South known as the "race problem."

But curiously the question has been discussed almost entirely with reference to the negro, his achievements, his aspirations, his needs, and his wrongs. In no instance during this twelve-year period have those comprising the party of the second part in this race problem—the common everyday white people of the South—had their real feelings and views expressed. True, some half-hearted, conciliatory articles by Southerners have appeared in various periodicals, but they merely skimmed the surface.

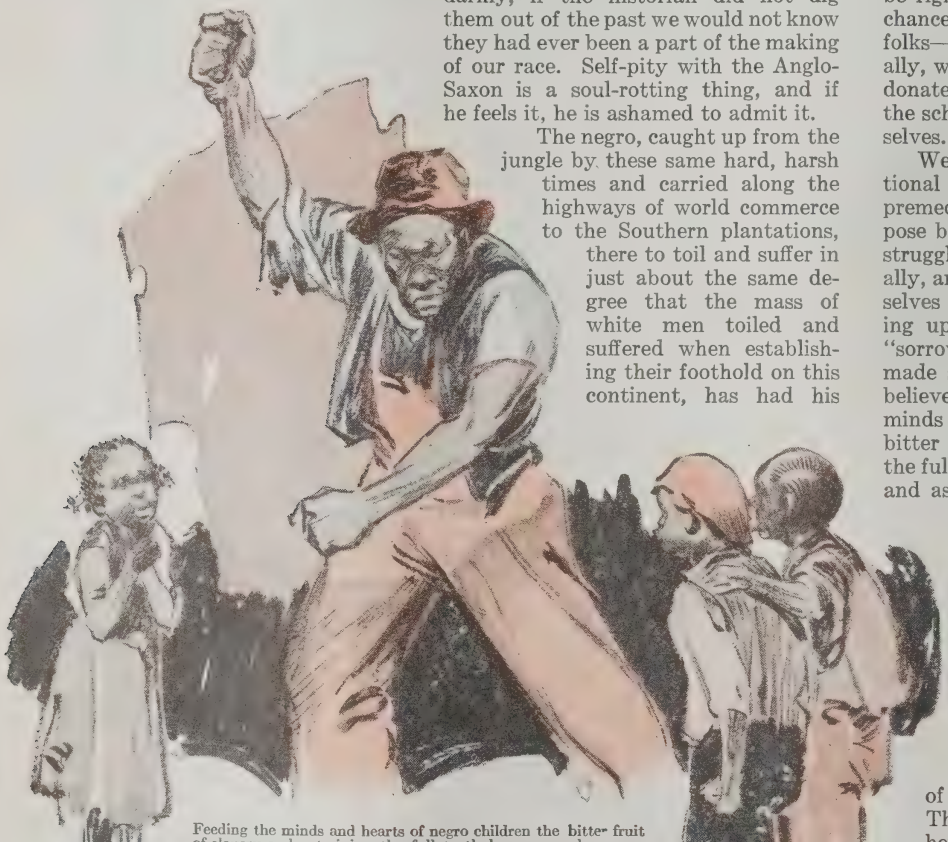
We Southerners seldom concern ourselves with the doings of the negro race as a whole; we are concerned only with those individuals with whom we have business dealings. Since the problem has seemed too much for the hearts and minds of mortal men to cope with, our inclination has been to say as little as possible about it, meet the issues of each day as best we could, and let the Almighty solve it in His own good time and way. Moreover, discussion of this highly sensitized theme, if carried to any considerable length, inevitably leads to controversy and recrimination, and the waving of the "bloody shirt" has for several decades been taboo in the South among the intelligent, forward-looking people.

Then, too, a negro is no new thing with us. We were a little amused and a little skeptical about the "new negro" about whom we were hearing so much. Bragging, over-confidence and enthusiasm accompany the growing-up act of races as well as boys. Let them, we said, have their day; life all too soon takes the starch out of us all. While the rest of the country was vigorously pleading the cause of the negro, we remained philosophical, believing it but a manifestation of the admirable American trait of sympathizing with the under-dog.

But we are beginning to feel that our silence is being interpreted not as patience and forbearance, but as the silence of the guilty. Moreover, we think that those who are speaking for the negro sometimes exceed the bounds of justice and wisdom in their demands on the white race. We feel that it is not only fair to the white people of the South but to the American people as a whole that we be permitted to speak—not in self-defense, for we intend to plead guilty to many things, but in order that as much light as possible be thrown on this vexing problem. Partial and superficial hearings sometimes lead to grave errors in adjudication.

We feel it is fair that we be permitted to speak, that light be thrown on this vexing problem.

The world must realize that a thing that has existed for more than sixty years and today involves some thirty million persons of about equal numbers of the white and the black races could not exist without deep and far-reaching causes, and with the good and bad elements in it being about equally divided between the races. A seesaw does not remain a seesaw with all the weight on one end.



And the world must realize also that when two races at opposite ends of the social and color scale are thrown together into a single inclosure, so to speak, there to work out their fate as best they may, some ugly, sinister things, as well as some beautiful, valuable human experiences, are bound to occur. Unless we may speak fully and give the ugly as well as the beautiful, we might as well close our lips and let the matter drift lopsidedly, or as it will.

Half measures have been tried and they have plunged us so deeply into confusion that only the most sanguine heart could interpret the deep underground rumblings as anything but ominous. We shall speak with no malice in our hearts; we aim merely to be frank. A people's thoughts and feelings constitute the only key to their actions. If sometimes the negro's feelings are pricked, he will please bear with us. We too have been pricked often. But a mutual confessing of faults and telling of grievances necessarily calls for a mutual endurance of pricks.

To begin this series with the theme of slavery might seem like rattling dry

bones of the past, but the race problem of today is no more separable from the past than is the color of a negro's skin or the pride and arrogance of the white race. To attempt to eliminate the past is to close the door on fundamental things and the original sources which have made the race problem a *race* problem and to treat it as a *sociological* problem involving such superficialities as the Jim Crow car and the location of the negro section of a city. These things are but the outward evidence; the real race problem strikes its roots into race traits and feelings as old as the races of people party to it.

We shall not concern ourselves with the history of slavery as history, nor to prove any point. The facts are available to all who want them. But we shall say in passing that it would be well for sectional and racial feeling if all of us studied more fully the entire history of slavery instead of its selected parts, as we have been doing. It is the moral and spiritual effect of slavery that we shall here consider.

Feeding the minds and hearts of negro children the bitter fruit of slavery and not giving the full truth becomes a dangerous sowing of the seeds of race hatred

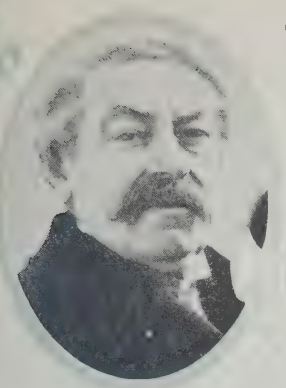
The way the races react to such things is the most outstanding example of the difference in the psychology of the white and the black race. A white man easily forgets past trouble and lives in the present and plans for the future. A whole race group of white men could never feel sorry for themselves and build their entire musical and literary achievement around one painful experience in their history, especially since, if the race were to progress, that experience were a necessary part of the upward march. The 17th and 18th Centuries were hard, harsh times when it was by no means certain which races or which nations would dominate the globe; the struggle was truly one for survival; it was a time of almost unceasing warfare and of pushing out into little-known lands and seas, with empire the stake and life the forfeit. Individual rights and personal freedom, as men exercise them today, were hardly dreamed of, much less realized. Public whipping posts, imprisonment for debt, binding out of boys and girls into virtual slavery were indicative of the spirit of the age.

*Individual Rights Then Were Undreamed of*

Yet as soon as the white man emerged from these experiences he forgot them and kept his face to the task ahead. As to coloring his spirit darkly, if the historian did not dig them out of the past we would not know they had ever been a part of the making of our race. Self-pity with the Anglo-Saxon is a soul-rotting thing, and if he feels it, he is ashamed to admit it.

The negro, caught up from the jungle by these same hard, harsh times and carried along the highways of world commerce to the Southern plantations, there to toil and suffer in just about the same degree that the mass of white men toiled and suffered when establishing their foothold on this continent, has had his soul filled with bitterness and his heart with hate. And the peculiar thing about it is that the negroes were not a powerful people dragged down from high estate and forced into slavery, but a savage people who were—from our viewpoint at least—being lifted up and given more material comforts than they could possibly have known in the pitiless struggle which savage people must ever wage for existence in a jungle.

The negro is still pitying himself for his former enslavement; he offers it as the reason for his shortcomings, it is his plea for a special indulgence at the hands of other men. In song and story he is keeping the wound fevered and throbbing; it is the motif of all his artistic endeavor, the red flag of his propaganda. Such phrases as "the new abolition," "the chains of civilization," "the freedom of the body and enslavement of the spirit" greet us daily from the press.



Go to almost any commencement exercise of the negro public school and in song, recitation and essay you will hear the sobs of the bereft slave mother, the wails of the man-made orphan, the clank of the chain and the swish of the slaver's whip. A listening Southerner can almost see creeping above these burning heart coals of the past, like smoke from a hidden fire, the hope that some day the negro's wrongs will be righted and the Lord give him the chance to even things with the white folks—the same white folks, incidentally, who have in nearly every instance donated the school building and kept the school going with taxes upon themselves.

*Sowing the Seeds of Race Hatred*

We cannot say whether this educational practice in the negro schools is premeditated or has any special purpose behind it; it might be merely the struggles of a race aborning artistically, and since they are told to be themselves and not imitators (a race dwelling upon its biggest achievement, its "sorrow" which the white folks have made so much of), we are inclined to believe it is this. This feeding to the minds and hearts of negro children the bitter fruit of slavery and not giving the full truth about it both as a practice and as a commercial institution growing out of the past ages becomes a dangerous sowing of the seeds of race hatred. The times demand fair-mindedness and a spirit of tolerance in all men.

That race animosity and a race consciousness embodying ideals quite different in some respects from our own have been and are being developed right in our midst is one price of segregation and separate schools. The other course would have been herding together children of both races, which would probably have left more race feeling than has come about through segregation. And even had that hardly-to-be-hoped-for end, perfect harmony and democracy of action between children and parents of both races in such mixed schools, been achieved, then a third problem would have presented itself, the inevitable setting toward blood mixing. All are agreed that the one solution of the race question which would be fatal to America is the dragging down of both race stocks into mongrelism and that hopeless mediocrity (Concluded on page 30)

# "Off Again! On Again! Gone Again!"

IN THE United States the Congresses that are elected in November in "even" years do not begin to function for thirteen months. After each Congress is elected, a hold-over or "lame duck" session of the old Congress, always composed in part, sometimes a large part, of men defeated for reëlection, is held and the Congressmen can—and sometimes do—enact legislation which the people only recently disapproved. A national executive administration has four months in which to thwart popular will, if it so desires.

A resolution is now pending in Congress to submit to the states an amendment correcting this weakness.

The European governments, which have taken their models rather from Great Britain than the United States, provide for more immediate action, and France seems to have improved upon the model. In France the Presidency has been reduced by constitution and practice to a post of honorary distinction and ceremonial prominence. The President of France can do nothing and is likely to lose his position if he tries.

The powerful figure in French affairs is the Premier, or president of the Council, while he retains the confidence—that is, a working majority—of the Chamber of Deputies and the Senate.

Deputies are elected for four years and Senators for nine, and these houses are not, like the British House of Commons, subject to dissolution at the will of the sovereign acting on the advice of the Prime Minister.

There is, therefore, no easy recourse to a popular referendum on a major issue, as is the case in Great Britain. The parliamentary elections, recurring at stated intervals, are often as confused by a variety of unimportant issues as in this country.

The Premier of France, therefore, lacks the British Prime Minister's strong weapon of an immediate reference of the issue to the people in the election of a new Parliament. If the people sustain him he is more firmly entrenched in his leading policy than before his measure was opposed.

Having the right, therefore, to make and unmake Premiers, the French national legislature, especially the Chamber of Deputies, has exercised it to the very limit.

When M. Waldeck-Rousseau became Premier in June, 1899, he was the thirty-seventh in the twenty-six years of the so-called Third Republic. Although changing so often, several men held the post more than once at different times. On this page is a list of the Premiers of the present century, and a glance at it shows that the average period of service, though it has lengthened somewhat, is still far too brief to insure the all-round, even continuity of policy essential to the prosperity of so great a nation.

In some respects this weakness is overcome by the continuance in office in several successive ministries of ministers who have directed important departments with great efficiency.

It has been no unusual occurrence for the retiring Premier, defeated on an issue involving another department than his own—each Premier assumes a "portfolio," or takes charge of a department, as the ministry of finance, or of foreign affairs, and so on—to become a member of the cabinet of his successor as the head of his old department, and eventually to return to the premiership, appointing his late chief to a place in his cabinet.

In this rapid rotation in office it is but natural that a few strong men should figure much more prominently than the rest. M. Waldeck-Rousseau broke the record by retaining office a few days less than three years and then resigning because of ill-health while still "in confidence."

Georges Clemenceau, a political journalist of active, fearless shrewdness, gained a reputation as a cabinet-wrecker before (Concluded on page 24)

### PREMIERS OF FRANCE OF THE 20TH CENTURY

M. Waldeck-Rousseau—June, 1899 to June 3, 1902
Emile Combes—June 10, 1902 to January, 1905
Maurice Rouvier—January 24, 1905 to March, 1906
Jean M. F. Sarrien—March 14 to October, 1906
Georges Clemenceau—October 29, 1906 to July, 1909
Aristide Briand—July, 1909 to February 11, 1911
Antoine E. Monis—February 28, 1911 to June 23, 1911
Joseph J. Caillaux—June 26, 1911 to January 10, 1912
Raymond Poincare—January 12, 1912 to January, 1913
Aristide Briand—January 18 to March 18, 1913
Louis Barthou—March, 1913 to December 2, 1913
Gaston Doumergue—December 8, 1913 to June 12, 1914
Rene Viviani—June 13, 1914 to October 29, 1915
Aristide Briand—October 29, 1915 to March 14, 1917
Alexandre Ribot—March 19 to September 10, 1917
Paul Painleve—September 12 to November 13, 1917
Georges Clemenceau—November 16, 1917 to January 18, 1920
Alexandre Millerand—January, 1920 to September 23, 1920
Georges Leygues—September 23, 1920 to January 12, 1921
Aristide Briand—January, 1921 to January, 1922
Raymond Poincare—January 12, 1922 to June 1, 1924
M. Francois-Mersal held office a few days to observe formalities.
Edouard Herriot—June 14, 1924 to April 10, 1925
Paul Painleve—April 16 to November 22, 1925
Aristide Briand—November 28, 1925 to March 6, 1926

# Is Europe Satisfied With the League?

## Governments and Peoples Differ as to What Benefits, If Any, Are to Be Derived

By WALTER M. WOLFF

NOW that the League of Nations, under the more or less able tutelage of Britain, France and Italy, has extended its motherly influence and affection to the utmost parts of the European continent, a few candid questions relative thereto should be quite in order. With the roster of members now almost completed, what do Europe's members and non-affiliants of the League think about that organization? Do they have real confidence in its qualifications? Are the people enthusiastic for it and do they regard it as the *summum bonum* or panacea for all the Old World's troubles? Will it ultimately strive for and establish the most important thing on earth worth striving for in the minds and hearts of the war-torn peoples: peace, lasting peace?

*Will It Bring Peace, Lasting Peace?*

It is generally well known that today every European nation except Russia, Germany and Turkey is associated with the League of Nations. Germany is waiting on the threshold to be admitted. Russia, like Humpty Dumpty, is still on the wall, and Turkey appears to be handling her own affairs admirably well in spite of the fact that the Turks have not yet been so much as remotely considered for membership, let alone being invited to join the compact.

And then there is Uncle Samuel, Europe's friend-in-need across the sea; why doesn't he belong? But this is, of course, quite another story. For the present we shall confine our observations only to Europe's opinion of its own creation—that is, discover, at least superficially, just how the polyglot people of the Continent regard the much-touted "family of the nations."

Americans as well as Europeans have been told that the League is a war-preventive, world-inclusive organization established for the purpose of more closely and specifically binding the nations which are involved in the European situation to the policy of conciliation and arbitration as regards the difficulties arising among themselves. Most of us are aware, however, that Britain and France have assumed the chaperonage of the League, that they are the *mobile perpetuum* behind the establishment. Britain's statesmen and France's leaders appear to be perfectly content with the League's past performances, and they cherish the fond hope that soon "all those still outside" will come with contrite hearts and apply for admission.

*There Are No Popular Demonstrations*

A strong League is unmistakably of the greatest importance to French and British interests; for by relieving the Empire and the Republic of their respective anxieties in Europe and insuring permanent reconstruction on the Continent through American credits, the Lion and the Tricolor may henceforth address themselves to the manifold problems of the colonies and the Far East.

*But the people?* Our attention has not as yet been called to any huge demonstrations or mass meetings indicative of popular League enthusiasm in either London or Paris, nor is it at all likely that such demonstrations will take place. The average Englishman, while unquestionably appreciating the exchange of felicitations between the nations and the professed sincerity of his statesmen in precipitating mutual understanding and actual peace, cannot be moved to loud acclamation for the League so long as the unemployment crisis and dire want and hunger stalk unmolested through the island. The British should have every good reason to believe that the League of Nations is all right, although they are at the same time perfectly justified in believing something to be all wrong with the way Great Britain is conducting her immediate domestic affairs.

*French Fear an Era of Inflation*

But what about the average Parisian, the citizen of Lyons, or the man who lives in Chateau Thierry? What does he know about the far-famed *Societe des Nations?* If the truth be known, he knows about the League of Nations equally as much as does the average Briton, German, Lithuanian or Walloon—namely, just what the newspapers and the professional propagandists wish to disclose to him concerning it. The majority of Frenchmen today, however, are not so much interested in studying the League's relative merits or discrepancies as they are in observing the daily rise and fall of the franc. The sons of France are not nearly so much afraid of the *revanche* from across the Rhine as they are of an impending inflation era similar to that of the German mark debauch with its long trail of misery and ruin among the common people. Readily enough, for the statesmen and the politicians of the powers the League is an important thing, a means to an end, whereas to the people it represents something of minor or secondary importance.

With respect to Italy's sentiment for the League it will suffice to say that the Italian people are hardly to be held accountable for their current political actions or emotions, inasmuch as they are at present sorely afflicted with a certain chronic ailment which we may term "Mussolinitis." So far as Mussolini is concerned the League of Nations is a very fine concoction: that is to say, as long as it does not conflict with Mussolini or his policies. His recent fervor-laden speeches in the South Tyrol episode with Germany very emphatically bear out this contention. Considering that the majority of the Italian people are behind Mussolini today it would be difficult to imagine that their views on the League considerably diverge from those expounded by the renowned *duce.* "The League of Nations? Why, of course!" says this son of Italy, "but Italy first, last and all the time, and then the League of Nations, if you please!"

*Italy First and Then the League*

So far as his chauvinism is concerned we might admire him; but from Mussolini on down to the last Fascist the Italian's conception of a family of nations organized to foster the common good is still something very much medieval in its character.

The "lesser" members of the League—that is, the nations not enjoying a permanent seat in the League Council, such as Belgium, Norway, Greece, Poland, Austria, and so on, as well as the smaller nations which belong to the so-called Little Entente—appear to be even less satisfied with the League. Most of these nations are beginning to realize that "equal representation," "right of the minorities," "peace through conciliation and arbitration" and the like are excellent diplomatic phrases with which to embellish protocols but are far less effective when put to practical use.

The minor European nations are learning that on the one hand there are large, influential countries with power to control and to manipulate international affairs for their own ends, and on the other hand small, less powerful, less influential units like themselves which are only pawns in the hands of the "big fellows." Is it any wonder, then, that the host of smaller states are clamoring for a larger measure of recognition and representation as members and coöperators in the League?

*Smaller States Clamor for Recognition*

# The Town That Lincoln Put On the Map

## New Salem, Being Restored as Memorial

By WILLIAM E. BARTON

Oval—Rebuilt Rutledge Tavern, which had a short life as one of New Salem's business places.

Right—Offut's store at New Salem, where Lincoln, as clerk, attracted a crowd with his wonderful fund of stories.

EDITOR'S NOTE:

The little village of New Salem has been in part rebuilt, and belongs to the State of Illinois. By means of the original surveys and records of lots sold, and the foundation stones which have been found a little underground, it has been possible to determine the location and exact size and ground lines of practically all the buildings of that little town. Old log buildings in the neighborhood have been purchased and re-erected on these old sites, and the town begins to look much as it did in Lincoln's day. A fireproof museum also has been erected there.

On the eighth of this month, the Illinois State Historical Society and the Mississippi Valley Historical Association meet in Springfield in joint session, and from there are to motor to New Salem for a celebration. The principal address on that occasion is to be by Dr. William E. Barton, author of *The Life of Abraham Lincoln*. Perhaps no other scholar is so competent to give to our readers information on this old village, unique among memories on earth, and its share in the life of Lincoln.

THE deathless fame of Abraham Lincoln brings back from the dead the little old town of New Salem. It had lived its brief moment of history and was deserted. Its last log cabin had crumbled or been removed. No stone stood upon other stone above ground to mark the site of one of its buildings. From having been a habitation of men it was given over to the wild life of the prairie. For three-quarters of a century it remained desolate and without inhabitants. Now it rises from the dead and shares in the immortality of Abraham Lincoln.

Many monuments have been erected to his memory, but none like this. There are mural tablets marking most of the more important events in his career. The log house where he was born and the lodging house where he died are both preserved and are the property of the national government. A Greek temple in granite enshrines the humble logs of the cabin where he first saw light, and the noblest marble memorial upon this continent stands in the national capital and looks across a reflecting pool at a towering shaft erected to the memory of George Washington. Busts and statues in bronze or durable stone stand in many cities in this land of ours, and not a few have been erected abroad. Few men in modern history have so many monuments. But among them all there is none like this.

Not only is New Salem unique among memorials of Abraham Lincoln, but as far as I am aware it occupies a place of its own among the monuments of the world. Shafts and columns and portrait statues in rather monotonous profusion litter the parks and boulevards of our cities, and few of them have any distinctive character or recall names which the world will long remember. But as far as I am aware there is no other instance in which a town that had once been inhabited and had been deserted has come into being again, not for purposes of residence or of commerce, but because of the sojourn within its gates of one particular man.

Brief was its history: The land was entered on July 29, 1828, by Rev. John M. Cameron and his uncle, James Rutledge. They previously had entered land at Sand Ridge on the waters of Concord Creek, their patent dating February 8, 1828, but a season proved the waters of (Concluded on page 31)

Museum on the site of the little town where Lincoln kept store.

# Passing of Yankee Country Store

## Better Transportation and Mail Order House Have Sounded Knell of Village Emporium

The loafers seated on the long benches indolently sat up.

By ELLA SHANNON BOWLES

ILLUSTRATED BY J. C. GRAHAM

THE loafers, seated on the long benches before a New Hampshire country store, stopped their whittling and desultory gossip and indolently sat up. Even the farmers' horses, nuzzling their soft noses in the three-gnawed and weather-beaten feeding troughs, raised their heads. An important event was about to happen, for the stagecoach which carried the mail and an occasional passenger to the mountain village was due on one of its triweekly trips. The rattle of the huge wagon and the clip-clop of the horses' feet sounded down the narrow, dusty road.

With a flourish of whip and a steadying of reins that almost swung the leaders to their haunches, the driver brought the stage to a standstill. He flung off the leather bag and the storekeeper, who combined the duties of postmaster with those of village trader, carried it inside the dimly lighted store. There was an excited buzz of expectancy as the few letters from the outside world were sorted. The storekeeper, however, was not allowed to read his two letters from Boston! He owed his community another duty. Since he was the only man in town who subscribed to a newspaper, he must first read to the assembled group the news of the war, for they were eagerly waiting to hear new facts about the conflict between the Union and the Confederate armies.

The storekeeper himself was a "man of parts." Shrewd at a bargain, keen-minded, just, kindly, he was a leader in the vicinity. Among his neighbors he was known as a rich man. His house was the largest in the village and boasted steel engravings and horsehair furniture in the parlor. He had sent his children away to school. His wife's black Sunday silk was rich and heavy. He was a deacon in the church, a justice of the peace, first selectman, chairman of the school committee, and had represented his town at the general court.

In 1840 he had opened a small general store. Now, in the sixties, he had taken his young son into the business, and had moved to larger quarters, taking it for granted that he would pass his "trade" down to his son and his son's son. He never thought of this village, where his personality and individuality were so strongly felt, without his store.

Twice a year the storekeeper went to Boston "to stock up." He was thrifty and careful in buying: Blue drilling for overalls, thirty pieces of calico, hoop skirts and bustles, cotton thread knotted in "hanks," red and white spotted bandanna handkerchiefs, cotton batting, "factory yarn," quaint buttons, pieces of glassware made by that "new company down on Cape Cod," a few webs of lawn, a piece or two of sprigged muslin, some webs of lace, needles, pins, an occasional piece of silk, hard candies for the children, as well as the groceries and hardware needed in the daily life of the village. Finally he added a few wall papers. Patent medicines followed in the wake of the tansy, thoroughwort, pennyroyal, sage and wormwood which the village women had brewed for the family aches and pains. Some of his customers were getting "citified" and didn't have their footgear made at the cobbler's, so he added boots and shoes to his stock. Crockery dishes, tinware, brushes, brooms, nails, hoes, any article that would contribute to New England rural life—he had them all!

The store had the mellow, human look of a place closely associated with a life current of the simple-hearted village people. Smoke from the "Franconia" iron stove in the center of the room and from numberless pipes blackened the ceilings. The floor was dark and rough from constant use. The store shelves, arranged from floor to ceiling, were packed with the mixture of groceries, patent medicines, tinware, crockery and dry goods. But in all this medley there was not one can of tinned vegetables or fruit. The storekeeper would never see one, nor could he picture the day when his grandson would fill tier after tier of his shelves with tins of bright-labeled vegetable products, cans of salmon and tuna fish, and later the glasses of tongue, meats, chicken, marmalades and jams!

The storekeeper sold home-dried apples, home-cured hams, and salt pork from the fall "killings." Pickled tripe floated in kegs filled with brine. And codfish! An entire chapter might be written upon the codfish which varied the menus of the farmers of the period. Not codfish flakes, nor shredded codfish put up in sanitary packages! The codfish which the storekeeper ordered each month in five-hundred-pound boxes were whole fish, and were taken home and hung up on the cellar door where the housewife cut off strips for picked fish and cream.

Odds and ends and notions were piled helter-skelter under the counters. The storekeeper and his son ducked beneath them to

(Concluded on page 27)

# MR. FORD'S PAGE

IT SHOULD be often in the minds of American citizens that no country is prosperous unless its prosperity reaches to all parts and classes. We practically recognize that fact with regard to classes. We have at last learned that questions of economic wealth are like questions of physical health: that no part of the community is safe so long as another part is infected. Plague in the poor quarters of the town menaces the wealthier sections. Disease among the children of the poor spells danger for the children of the other classes. Our fates are all one in that respect.

The poverty of the poor likewise menaces the prosperity of those who may not be poor. If a nation is growing poor, every man is growing poorer. There are matters which do not stop at class lines, but overlap them, to teach us the unity of our lives and destiny.

But we have not as yet become so vividly conscious of the geography of the law. Our country at the present moment is rated as the most prosperous anywhere in the world or at any time in history, but it needs only a little observation to become aware that this is not true of all parts of the country equally. There are spots of economic aridity which need to be watered by the springs of productive wealth. There is a vast amount of irrigation, so to speak, needing to be done.

One looks over the various sections of country only to be struck by the fact that what we call prosperity has its more or less distinct centers, and that often these centers do not radiate very far into the neighboring territory. It renders one most willing to say that no man is entitled to speak proudly of American prosperity until he has consciously done his utmost to increase its spread over those portions of the country which are as yet untouched by the increase of means and opportunity which has come abundantly to certain other portions.

We are on the line where two kinds of wealth are distinguishable among us. There is the wealth which exists and grows by reason of sucking in the resources of others, a parasitic sort of wealth. We have seen at least one of our great centers win a national dominance by establishing a system whereby small rivulets from the back country are made confluent in one mighty river whose flow is directed toward a single speculative center. That is the suction-pump method. It draws in all it can, and gives out again only what it must, doing even that little in a manner that returns least benefit.

Then there is the kind of wealth which grows by division. It spreads itself like beneficent light and heat over the waste places, causing them to bloom. It is wealth which reproduces itself in general benefit, and runs like roots everywhere to bring fresh opportunity to people.

Now a little of this latter use of wealth—rather, very much of it—is needed in the United States. It is time to cease regarding backward sections as deserving mere neglect until forsooth they become contributors. Rather it is time to prime them as we prime pumps, using the wealth we have to start them on the road to productive benefits, and lift them from the plane of low-spirited need to high-spirited self-sustenance.

Fortunately for the character of much American wealth, this is its unconscious effect. But more of conscious effect is needed. There are whole states in our land which are lying heavy-hearted in the back lands of neglect. Their rich, fertile lands and forests are untenanted and unused. There are Americans by the million who read of American prosperity as a distant mirage: and not even a mirage, for one may see a mirage, but millions of these Americans have not seen prosperity. There is much that we can do for them to bring them into step with the rest of the nation. We can use our honest wealth as seed and fertilizer for a wider crop of prosperity, equally distributed over the country, and thereby we can redeem ourselves from the reproach of having whole areas of America where no prosperity can be found.

This is a new form of equality which can be readily established in the land, and with the distributive motive in wealth, instead of the suction-pump motive, it can be achieved. At least we ought not to talk about American prosperity until we have a definite idea of how much of our territory and population can be included in that description.

*NO country can be considered prosperous unless its prosperity reaches to all parts and to all classes. No man is entitled to speak proudly of American prosperity until he has conscientiously done his best to spread it over those portions of the country which are as yet untouched by the increase of means and opportunity. There are whole states in our land which are lying heavy-hearted in the back lands of neglect. There is much that we can do to bring them into step with the rest of the nation.*

## *The True Sesqui-Centennial*

WE MUST not allow the Sesqui-Centennial fiasco in Philadelphia to blind us to the fact that the 150th anniversary of America as a nation is an event worthy of splendid commemoration, an occasion for reverence, not in one city alone, but in every state, every town, every home in the land. The birth of America 150 years ago was a happening so momentous that even now we cannot fully grasp its true significance. For the first time was founded a nation dedicated to liberty and to the equality of mankind. A beacon was struck that shone into the dim, far corners of the earth.

In the years that followed the Revolution, the country forged steadily ahead toward its destiny. The land was peopled by a sturdy race, a race possessed of ideals, of integrity, of honor. The people regulated themselves by certain standards—*American standards*, they came to be known. Resolutely they set their faces ahead and marched into the future. They met their problems squarely, without flinching. They overcame the wilderness; they endured untold hardship. In a devastating civil war they purged their country of the evil of slavery.

And always they toiled up the steep path of progress. Compare the 150 years of America's life with any similar period in history. It is the greatest era of advancement, of enlightenment, of freedom since creation. America lighted the torch; America led the way. Other peoples of the earth were awakened from their sleep, their sloth of centuries. Not alone in government did the Americans progress—they were inventive, they were pioneers in science, in business. Their object was to make life worth while for the poor and humble as well as the rich and powerful.

The ideals, the inner conscience of the race, urged it ever forward to new endeavors, new heights. America led, not by mixing in the petty jealousies and racial hatreds of the old nations, but by keeping to the straight path. Then came the Great War—and America sent its youth overseas to die, not for conquest or personal gain, but from a noble impulse to save the world from its own madness. It was a magnificent gesture, one that should have earned the gratitude, the friendship of all nations. But instead Europe viewed America through its own discolored lens of suspicion, of selfishness.

The older nations saw in America's power a mighty weapon to help them to their own ends; they hoped to embroil this nation in their discord. America, they said, having made the step, could not turn back. It must be forever entangled in the web of old-world politics; it must join the League of Nations; it must bind itself to the decrees of the World Court! America stands today at the crossroads, 150 years after the Signing of the Declaration of Independence, after the baptism of the nation in blood. For a century and a half the nation has forged its way ahead, *alone*. It has worked out its own salvation; it has welded its own destiny. It has been a guiding light for the world *because it held itself aloof from old-world intrigue!* The anniversary of our independence is a solemn thing.

It is an occasion, not for a glorified street fair, but for solemn meditation, for rededication of America to those principles and ideals which made it the great nation it is!

## *Up From Slavery*

THE cruelest punishment of all time was that of the galley slave, chained to his oar, beaten to his task, hounded to his death, that another unfortunate, newer at the work, might be chained to his place. Neither preacher nor reformer, society nor king was responsible for his final freeing. Genius devised a way to sail ships cheaper and with more cargo space, and industry itself let him go.

The inventor and engineer freed the galley slave: today they are freeing the world from all lesser slaveries. Drudgery is being taken out of life, and a time of leisure for self-improvement is being made available for all men.

A million slaves work for us today, but they are inanimate and incapable of either fear or pain.

Power—in the home, on the farm, in the shop, on the high seas, over land and in the air—is carrying with industry a host of mechanical missionaries to every place.

As we accept and use power, so are we freed from our own slavery.

## *Is THIS Puritanical?*

"WHO are the real enemies of our Republic? The most important group I would call the writing men—literary fellows who are straining every nerve to foist upon America the ultrasophistication, the blasé civilization of Europe. There is no simplicity, no old-fashioned morality in their

literature. There is the decadent type of the old French literature they are pouring out to poison and stain the mind and character of American youth.

"They have contempt for Main Street—meaning, of course, contempt for respectable John Smith and his wife, who love simplicity and honesty and who are unsophisticated. They prefer Broadway with its dirty plays and indecent naked revues. They prefer the Broadway of shamelessness where, in the phrase of the day, 'everything goes.' They prefer the Broadway where, after seeing a dirty show, the sophisticated go to a rotten night club, where we read that, in the midst of drinking and naked dancing, murder has been done.

"Scarcely any play can get along on Broadway today without a prostitute. David Belasco puts on a dirty play and says he does so because everybody is doing it, and William A. Brady says, 'I'll take off my dirty show if you take off yours.' Does that represent the acme of dramatic ethics?"

The words are those of Father James M. Gillis, of the Roman Catholic Church. They were uttered within a stone's throw of Broadway.

---

## *Postponing the Reckoning*

RESPONSIBILITY for the Italian debt agreement lies directly at the feet of Secretary Mellon and the other leaders of the Administration. If praise comes in later years it will be theirs alone; if censure comes, it too will be theirs. By a remarkable feat of mental calisthenics Secretary Mellon has reached the conclusion that Italy, with its utmost efforts, can pay only $5,000,000 a year for the next five years. But at the end of that period, he reckons, the nation can pay $12,100,000—and a rapidly increasing sum each year thereafter until for the sixty-second year nearly $80,000,000 will be due!

Mr. Mellon's interesting deductions might bear more weight did they not follow so closely upon Otto H. Kahn's recent pean in praise of Mussolini; did they not contrast so strangely with Mussolini's trumpetings of war. The Italian debt settlement is without doubt eminently satisfactory to international bankers who have outstanding loans of their own; it is highly pleasing to politicians who will be out of office before the shoe begins to pinch the Italian foot. But what of the people of the two nations? What of future generations?

Does even the most optimistic politician in Washington sincerely believe that Italy will pay the sums scheduled for the future without protest?

## *Starving Our Soil*

Here are some interesting figures:

| | Wheat per acre (bushels) | Fertilizer used (pounds) |
|---|---|---|
| United States | 13.9 | 5.1 |
| Holland | 41.1 | 168.4 |
| Denmark | 39.0 | 14.6 |
| Belgium | 35.4 | 30.4 |
| England | 31.2 | 19.0 |
| Germany | 20.5 | 65.0 |

The table, compiled by the National Industrial Conference Board, carries its own comment. England, where the soil has been farmed for centuries, produces two-and-a-half times as much wheat on each acre devoted to that crop as we do. Denmark produces three times as much.

We are not farming our soil, we are mining it, succinctly remarks the board in analyzing the situation. But that merely states the problem; it does not answer it. American farmers are for the most part alert, progressive; they use up-to-date farm equipment; they employ modern agricultural methods.

Why, then, do they not enrich their soil with fertilizer? *The answer is that they cannot afford it!* Cheap fertilizer is one of the greatest needs in America today.

## *"A Personal Affair"*

A YEAR ago Max Goldberg, of New York's East Side, was questioned about the murder of "Lefty" Kanter.

"Listen, Captain," he protested at the police station, "this is a personal affair. The police ain't got no business interfering."

Today Goldberg himself is dead, the victim of another little "personal affair." His demise is of small moment; but his words are significant. Murder, under fundamental American law and inborn American conviction, is an offense against the State. It is the major crime. It carries with it the brand of Cain. In the early days of the Republic murder was infrequent. The people viewed it with dread, with abhorrence; they saw to it that the murderer was speedily punished.

But in recent years we have permitted people of a different race, a different breed, a different outlook, to swarm into our country. They have brought with them a new moral code, a new system of ethics. Last year there were more than 12,000 homicides in the United States! New York State has just appointed a commission to determine the cause of crime. Perhaps the commission would do well to start with the Goldbergs, who consider murder a little "personal affair."

# Woodrow Wilson, Master of Dreams

## All Along the Route Toward Realization of Ideals He Preserved His *Savoir Faire*

PART VII

"If you can dream and not make dreams your master,
If you can think—and not make thoughts your aim."

WOODROW WILSON was a dreamer. He was a dreamer by inheritance. With all the talk and chaff about the Scots and their canniness, there is no race more given to dreaming. The Scottish blood in Wilson, with its Irish blend, was no exception. In his many speeches, the great majority of which were extempore and were uttered in the white heat of inspiration that comes from contact with an audience, he was repeatedly dealing with ideals and dreams. His foes were right when they said that he was a dreamer. What irritated them was that Woodrow Wilson was consistently making his dreams a reality. Wilson was also guilty of another charge laid at his doors by his enemies and admitted by his friends. He was ambitious. He was even covetous. It was the ambitious covetousness described in an exclamation of Henry V, often quoted and loved by Wilson, when Henry exclaims: "If it be an offense to covet honor then I am the most offending soul alive."

I do not know whether Mr. Wilson revealed himself as a dreamer in his boyhood days. Certainly he was very busy in early manhood, not only dreaming, but forging those dreams into living things such as his books. When he grew older and found himself he did not hesitate to speak out his dreams and ask others to help him make them come true. At Princeton it was "Princeton for the Nation's Service." Later on he visioned, in his *New Freedom*, a nation released from the chains of monopoly and economic concentration.

In the early part of his first administration and until the war broke out he sought to make this vision an actua ity through legislation and administration. Lastly, he dreamed of a world free from war, and summoned all peoples to bring this about through a League of Nations. On several occasions in his years at Princeton I came upon him in the midst of forging one of his visions into reality. If ever there was a man on fire it was Woodrow Wilson on such an occasion.

President and Mrs. Wilson in a jovial mood aboard their special train at St. Joseph, Missouri.

By HUSTON THOMPSON

Copyright, 1926, by Huston Thompson.

Along the route toward realization of his dreams or accomplishments, Woodrow Wilson, despite his conscientious attitude toward the problems before him, was a warm-hearted, impulsive, joyous person of unusual charm. If, in the manifestation of these characteristics, one trait stood out above others, it was his consideration for those about him. He was wholly unselfish and ever conscious of the comfort, convenience and pleasure of his companions.

No more striking illustration of his companionable habits could be found than in his relations with the newspapermen and others who traveled with him in the 1912 campaign. The party occupied two private cars and spent three months touring the country. A representative of the Pennsylvania Railroad went along to make arrangements. A Western Union man accompanied the party to look after the great volume of press telegrams that had to be filed at the most accessible places. Two stenographers were carried to take down speeches and write letters. At least one secretary and a bodyguard went along. There were also nine newspaper correspondents all the time and extra men from each locality visited.

The rear car was a combination dining, parlor, and sleeping car. Mr. Wilson occupied a stateroom in the center equipped with a double brass bed. Beyond his quarters was an observation parlor and observation platform. Forward in the car was the dining room, kitchen, and a shower bath. The other car was a solid compartment car, where the rest of the party worked and slept. All took their meals together in the dining room, and all rode together in the observation parlor during hours of leisure, between long jumps.

Three months of living at such close quarters, under the pressure and excitement of a presidential campaign, caused all members of the party to become well acquainted with one another. Intimate friendships were formed. Real, innermost traits of character were revealed. Mr. Wilson assumed no reserve whatever. He entered wholeheartedly into the spirit and psychology of the party. He took his share of the bumps, the hard knocks, and the discomforts that are inevitable in such an enterprise. He would accept no special consideration because of his position. Never did he allow his disapproval of the stories that the newspapermen might turn out to swerve his courtesy or kindliness toward them.

Anybody who has ever been on a camping trip with one grouch or one drone in the party knows how disagreeable conditions may become. On the other hand, he also knows the delight of such companionship if everyone is a "good sport" and "plays the game." A presidential campaign is exactly like a camping trip in this respect, and on the Wilson train it was a matter of happy comment that Governor Wilson rang true as a good fellow and square shooter under all circumstances and conditions. For example, there were usually more persons for meals than there were places

at table. Sometimes he would be late and somebody else would be at the head of the board. Upon Mr. Wilson's arrival that somebody would rise and urge him to have his seat.

"No, no, I'll not take it," the Governor would protest. "Here, if Smith will slide over a bit I can squeeze in between him and Jones."

And he would climb up on the upholstered bench that ran along one side of the table, double his long legs underneath and smilingly make the best of cramped quarters. Sometimes there would be a shortage of some article of food and others would urge Governor Wilson to take their share. He would good-naturedly decline.

*The Worst Thing Is the Local Committee*

"Not on your life," he would say. "You've got to work in this next town and all I have to do is make a speech. If I can have just a glass of milk and some bread and butter I'll be fixed."

The worst thing about a presidential campaign is the local committee. I was on one myself in 1912 when Mr. Wilson came to Denver, but I had gone East to join him, and I hope I derived some profit from the journey and from my observation of local committees en route. For weeks preparations have been under way. There has probably been a scrap over the chairmanship of the reception committee, because there are always at least two factions in each party in each town. A representative of the National Committee has visited the town, like an advance agent for a circus, and has worked out all details for the day with the local chairman. When the advance agent arrives he always finds a schedule made up for the candidate that nobody but a Hercules moving in an airplane could follow. He edits the program, cuts out two or three meetings, comes to a definite understanding that there shall be, say, two speeches, one at noon and one at four o'clock. He makes it perfectly clear that the candidate will have had a big meeting at the preceding town the night before, that he will not have left such town until after midnight, and that he must have the forenoon free from engagements, to rest and prepare his speeches.

The advance agent also supplies the local committee with the names of the people in the candidate's train. He explains how necessary it is to furnish automobile transportation and hotel accommodations for the secretaries, stenographers and newspaper reporters. The local chairman notes all the advance agent says, but as soon as the advance agent leaves he goes right ahead fixing up his own program. He arranges a breakfast to be attended by the political leaders; a ride about the city, during which the candidate is to stop at the local high school, where the children have been drilled for weeks to receive him; lunch at a country club, where a speech will be called for; another speech out-of-doors early in the afternoon; a public reception in the lobby of the principal hotel; a speech in the auditorium at 4 p.m., and tea at the house of the most prominent local woman at five-thirty.

*What Candidates Have to Put Up With*

When the candidate arrives he finds all this staring him in the face, despite the efforts of the advance agent. And he must go through with it. Any curtailment at that hour will be charged to him. For instance, if he doesn't go by the high school, he will leave twelve hundred children, dressed in their best bibs and tuckers, standing for hours waiting for him and finally dispersing disconsolately and bitterly, and blaming him for not coming to see them. Nobody will know it was the fault of the local committee. Likewise, if he cuts the tea at the social leader's house, he will make a hundred bitter-tongued enemies. So he grits his teeth and goes to it.

This one day is the only day of the whole campaign for that town. It is one of one hundred days to the candidate, who must go through the same thing all over again, beginning the next morning.
